S., 1919, Part II), published April 14, 1921; II: 19, Mica in 1919, by Herbert Insley (Mineral Resources of the U. S., 1919, Part II), published March 28, 1921; II: 35, Coal in 1918, by C. E. Leshner (Mineral Resources of the U. S., 1918, Part II), published Dec. 6, 1920; II: 37, Coke in 1918, by C. E. Leshner and F. G. Tryon (Mineral Resources of the U. S., 1918, Part II), published April 22, 1921.

Manufacturers' Catalogs

W. W. SLY MFG. Co., Cleveland, O., has issued a new folder, No. 80, describing dust-collecting problems as solved by Sly dust arresters. The company is manufacturing a general line of apparatus for collecting industrial dusts and several of the installations which have been made are attractively illustrated in this publication.

THE BREGEAT CORP. OF AMERICA, New York City, has published a booklet on "The Bregeat Process for the Recovery of Volatile Solvents."

THE METAL & THERMIT CORP., New York City, has issued a booklet entitled "Instruction for the Use of Thermit Welding in Railroad Shops."

THE BOONTON RUBBER MFG. Co., Boonton, N. J., calls attention to a new catalog on "Boonton Bakelite," which is molded material for electrical insulations and for mechanical, chemical and other purposes. Many interesting illustrations are given.

THE JEFFREY MFG. Co., Columbus, O., has received from the press Catalog 257, on Jeffrey Standardized Scraper Conveyors. It features both single and double strand conveyors designed to handle all kinds of loose products in manufacturing and mining industries, power plants, retail coal yards, canning plants, sugar mills and practically all other industries. Instruction, specifications and dimensions are given. Copies will be sent to interested persons upon request.

EDWARD R. LADEW Co., New York, has recently issued two catalogs. "The Proof Book" is a compilation of evidence of the dependability of Hoyt leather belting in service, with a brief discussion of some of the fundamentals of belting economy. The illustrations are from actual installation, showing Hoyt belts in service over various periods up to forty-four years, together with illustrations of a variety of difficult drives. "Ladew Leather Belting" is an 80-page catalog describing the manufacture of Hoyt leather belting from the rough hide to the finished product. Belting rules and tables are given, with a data sheet for analysis of belt drives for highest economy. Belting accessories are also included.

FRANK D. CHASE, INC., Chicago, Ill., announces two new catalogs. "Industry" is the title of one which contains a number of interesting articles, among which there is one by Frank D. Chase on "The Employer's Analysis of an Engineer." "Factories that Fit" is the title of the other publication. The purpose of the book is to convey the Chase conception of sound engineering design in factory construction. Many illustrations are given which show examples of the company's work.

THE PYROELECTRIC INSTRUMENT Co., Trenton, N. J., has issued a price list of apparatus for electrometric and colorimetric determinations of hydrogen ion concentrations.

THE WHITING CORP., Harvey, Ill., has issued catalog 156, on Ladle. The catalog is well illustrated.

THE J. L. MOTT IRON WORKS, New York City, has issued three new catalogs. No. 3-A deals with Metal Melting Pots and Fur-

naces, coal, gas and oil; No. 5 deals with Stills, Vacuum Pans and Condensers; No. 10 is on Acid Eggs, Blow Cases and Filters. Each booklet is well illustrated.

THE THWING INSTRUMENT Co., Philadelphia, Pa., calls attention to Bulletin 19, which treats of Type A thermoelectric pyrometers, both indicating and recording, which are particularly adapted for chemical and metallurgical industries. The booklet is illustrated.

THE DUST RECOVERING & CONVEYING SYSTEM, Cleveland, O., has issued bulletins 12 and 501, the first of which outlines the development of dust-collecting equipment and the second of pneumatic conveying equipment. Bulletin 12 is well illustrated, showing the simplest equipment used in dust recovery together with the Dracco Perfecto, the latest type of dust recovery installation. Bulletin 501 shows the simple practice in pneumatic conveying where some dust may escape through the pump, where air is filtered after passing the pump, where coarse and fine contents are discharged separately and where coarse and fine contents are discharged together. The receiver can be arranged in this system to meet any discharge requirements.

GEORGE J. HAGAN Co., Pittsburgh, Pa., is issuing a new gas producer bulletin describing the Hagan hand-stoked producer and also pointing out the service which the company can render in connection with producer installations, together with interesting illustrations and blue prints. This company has also issued Bulletin LF 101 on Liquid Fuel Burners for open-hearth and other regenerative furnaces. Descriptions and illustrations are given together with blue prints.

THE HARDINGE Co., New York, announces the publication of the sixth of its series of Grinding Data Bulletins. This bulletin presents interesting data on the operation of the large sized Hardinge mills in the mining field, not only where the stage reduction is the custom, but also where the single stage method is in use. The whole series of bulletins embodies information on Hardinge mills and other types of grinders.

THE MINE & SMELTER SUPPLY Co., New York, Denver, Salt Lake City and El Paso, has published Bulletin 64 descriptive of Wilfley concentrating tables. In addition to the generally understood use of these devices in ore treatment, they are recommended for such purposes as the recovery of metallics from refuse in brass foundries and for the washing of inferior coal.

THE YOUNGSTOWN BOILER & TANK Co., Youngstown, O., has issued a 19-page bulletin illustrating and describing Youngstown tanks and showing how standardized size save money. Much other valuable information for tank users is contained in this bulletin.

C. F. PEASE Co., of 813 North Franklin St., Chicago, has issued an attractive new catalog, S-41, for the engineers' surveyors field and office supplies.

W. E. PRINDLE Co., engineer, Columbus, O., in a new catalog illustrates and describes the design and construction of the Prindle driers. In these driers the application of the drying agent, whether it be direct heat, indirect heat or steam-heated air, have been worked out so as to give the best results. Types 10 to 15 inclusive are illustrated and described. General construction of the driers is described together with the guarantee, replacement patents and a note to prospective customers as to what data are required to give quotations, etc.

THE GRISCOM-RUSSELL Co., New York, has issued several new bulletins. G-R Regenerative Compressor is the title of Bulletin 350, which describes and illustrates a unique patented apparatus just placed on the market. This apparatus is designed for installation on Reilly evaporators, self-sealing, and its use during period of reduced evaporator capacity is said to permit evaporator operation at an efficiency much greater than can be secured by the evaporator operating alone, single effect. Bulletin 315 describes the G-R multiscreen filter, a redesign of the Reilly water filter and grease extractor. Bulletin 330 covers the Reilly evaporators, self-sealing, for marine service.

THE CUTLER-HAMMER MFG., Co., Milwaukee, Wis., calls attention to a number of new leaflets and booklets. A four-page leaflet, entitled "C-H Iron-Clad Solenoid," describes electric solenoids for operating brakes, clutches, valves and similar devices where a straight line motion is desired. Electrically operated brakes are described and illustrated in a 16-page booklet, which is known as Publication 850. Publications 875 and 876 are of interest to men of the gas industry. The former is a 12-

page booklet descriptive of the Thomas meter, which is used for measuring large quantities of commercial gases and air, while the latter describes the Thomas calorimeter, which gives graphical records of the total heating values of gases.

THE CHICAGO PNEUMATIC TOOL Co., New York, calls attention to two new publications. Bulletin 639 illustrates and describes BQ-46 hammer drill and Bulletin 607 contains a comprehensive description and several interesting applications of the Chicago pneumatic oil-engine-driven compressors. These machines are built in both stationary and portable types. A comparison of their operating cost versus steam-driven compressors appears on pages 20 and 21.

THE VANADIUM CORP. OF AMERICA, New York, has issued an attractive catalog on Vanadium, in war and peace. The booklet describes and illustrates the many uses of vanadium products.

DE LAVAL STEAM TURBINE Co., Trenton, N. J., has just published "Ten Years Progress in Water Works Pumps." The first half of the book is devoted to a discussion of the economy of different types of pumping units and to a description of notable installations of turbine-driven centrifugal pumps in municipal pumping plants, while the second part of the book takes up the testing of steam turbines and centrifugal pumps and the measurement of head and discharge, which should be of interest to engineers generally. The book will be distributed free of charge to interested persons.

Coming Meetings and Events

AMERICAN CHEMICAL SOCIETY, THE SOCIETY OF CHEMICAL INDUSTRY and the American Section of the latter society will hold a joint meeting in New York, Sept. 6 to 10.

AMERICAN ELECTROCHEMICAL SOCIETY will hold its fall meeting in Lake Placid, N. Y., Sept. 29 and 30, and Oct. 1.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS will hold its spring meeting June 20 to 24 at Detroit. Industrial excursions will be made to Ann Arbor, Saginaw, Midland and Bay City.

AMERICAN IRON AND STEEL INSTITUTE will hold its nineteenth general meeting in the Hotel Commodore, New York, on Friday, May 27. There will be three sessions: A forenoon session beginning at 10 o'clock daylight saving time (9 a.m. Eastern time); an afternoon session at 2; and a banquet in the evening at 7.

AMERICAN LEATHER CHEMISTS ASSOCIATION will hold its eighteenth annual meeting at the Hotel Ambassador, Atlantic City, June 9, 10 and 11.

AMERICAN MINING CONGRESS AND NATIONAL EXPOSITION OF MINES AND MINING EQUIPMENT will hold its twenty-fourth annual convention in the Coliseum, Chicago, Oct. 17 to 22.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS will hold its spring meeting at the Congress Hotel, Chicago, May 23 to 26.

AMERICAN SOCIETY FOR STEEL TREATING will hold its third annual convention and exhibition Sept. 19 to 24 at Indianapolis.

AMERICAN SOCIETY FOR TESTING MATERIALS will hold its 1921 annual meeting in the New Monterey Hotel, Asbury Park, N. J., during the week of June 20.

THE NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (SEVENTH) will be held during the week of Sept. 12, in the Eighth Coast Artillery Armory, New York City.

NATIONAL FERTILIZER ASSOCIATION will hold its twenty-eighth annual convention at the Greenbrier Hotel, White Sulphur Springs, W. Va., the week beginning June 20.

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stettens Restaurant, 342 Broad St., Newark, N. J., the second Monday of every month.

SOCIETY OF CHEMICAL INDUSTRY (BRITISH) at the invitation of the Montreal section will hold its annual meeting in Montreal and other Canadian cities during the week of Aug. 29, 1921. Details will be printed in this magazine from time to time.

STAMFORD CHEMICAL SOCIETY, Stamford, Conn., holds a meeting in the lecture room of the local high school on the fourth Monday of each month, except June, July, August and September.

The following chemical societies will meet at Rumford Hall, Chemists' Club, New York City, as follows: May 20, Society of Chemical Industry; June 10, American Chemical Society.

Home Valuation Of Imports

THE framers of the new tariff are seriously considering the advisability of assessing ad valorem duties on American rather than foreign valuation. Although a radical departure from present practice, the proposal is generally looked upon with favor as a practical solution of the difficulties arising out of undervaluation, the chaotic condition of foreign exchange and the widely different production costs in this country and abroad. The foreign market value has been the basis for our ad valorem duties for practically a century and naturally the Government officials are reluctant to sanction a change which might upset the existing routine of customs administration.

It is pointed out, however, that there are many serious objections to our present system. The difficulties in obtaining foreign costs have made it necessary to rely more and more on the purchase price as stated in the importer's invoice. The differences in the costs of production in the various foreign countries have caused the assessment of different duties on the same article when imported from a number of sources. This, it is held, is a discrimination against countries in which costs are high and at the same time a direct concession to the foreign producer with low costs, from whom the domestic manufacturer is most desirous of being protected.

A concrete instance was brought to the attention of the Ways and Means Committee not long ago by HENRY HOWARD, the representative of the Manufacturing Chemists Association. He stated that a certain medicinal of German manufacture was being offered in the United States for 68 cents per pound on which a duty of 25 per cent ad valorem had been paid. This would indicate that the selling price in Germany was in the neighborhood of 55 cents, while at the same time the article was selling in England for \$1.50 per pound. Our duty on the British product would amount to 37.5 cents, or practically three times that imposed on the German. Another objection results from the difference in many countries between consumption and export prices.

Under the existing law duties are assessed on the "actual market value and wholesale price of the merchandise at the time of exportation to the United States, in the principal markets of the country whence the same has been imported" notwithstanding the fact that the imported goods are often purchased at substantially higher export prices.

These objections would be met in a large measure by the adoption of American valuation. In the first place, the value on which the duty is to be assessed would be determined in this country, where our Government has jurisdiction and ample authority, if need be, to compel

the disclosure of the necessary information. Second, under the American valuation plan, all countries would be on a parity with respect to the duties paid. It is claimed that the ultimate consumer will not be burdened through its operation, because in the United States the prices demanded by the high-cost countries operate to fix the prices and the low-cost countries are directly benefited. An indirect advantage, which was pointed out by Mr. HOOVER in his recent testimony before the committee, is that data obtained in the administration of home valuation can be put to the direct benefit of the public by utilizing the information for more accurate indexes of price movements.

Opposition to home valuation has come principally from importing interests which realize that its adoption will tend materially to increase the general level, that is, the amount of ad valorem duties. Others have opposed the plan because of the difficulties in its administration. If the principle is adopted it must be decided whether values are to be fixed at the port of importation or in the principal market or markets of the country, whether the time for appraisement is to be the date of the exportation or of the importation, and finally and what is perhaps of most importance, whether the values determined are to be the prices of imported merchandise or of similar or identical American products.

The action of the Congress will be awaited with interest, for the plan of home valuation, if adopted, must largely depend for its success on the solution of these administrative problems.

Madame Curie Honored By New York Chemists

THE luncheon by the chemists of New York to Mme. CURIE was a very distinguished affair. There were upward of 600 persons present, and it had the quality of an important social event. OSCAR, the *maitre d'hôtel* of the Waldorf-Astoria, had a special conference with the chef, who, for the love of France, gave the preparation his most particular attention, and Dr. EDGAR FAHS SMITH presided. That should be enough to satisfy any potentate! There were four speeches, every one to the point, and every one of the sort that made those present wish for more. Dean PEGRAM of Columbia spoke as a physicist, Dr. MOORE of the Bureau of Mines spoke as a chemist, and Dr. WOOD of the Crocker Cancer Research Institute at Columbia spoke as a physician. Dr. SMITH's introduction was a prose poem, and in conclusion when he introduced the Queen of Science and the musicians played the Polish national anthem it was just a little emotional. Mme. CURIE has been the recipient of many honors since her arrival on our shores, but none, we opine, has been more distinguished and delightful than this.

Occupational Diseases in The Chemical Industries

AT THE Rochester meeting of the American Chemical Society Prof. CHARLES BASKERVILLE of New York presented his report as chairman of the committee on occupational diseases. It contained a great deal of instructive information and was characteristic of all work undertaken by Dr. BASKERVILLE in that it was thorough, well arranged and competently prepared.

The reduction of occupational diseases in the chemical industries during the past year has been due chiefly to the decline in business. Fewer men have been employed. Then, too, the rush and disorder of war time were especially provocative of neglect of details that under ordinary conditions would be severely criticized. For this reason it is noticeable that complaints against chemical works as causing nuisance or injury increased materially as soon as the Armistice was signed. It is recorded, however, that there has been a distinct improvement on the part of chemical manufacturers to safeguard and protect their workers.

The change in the name of methyl alcohol to methanol has been largely adopted, and the committee believes this has had a decided effect in decreasing its use as a beverage. To the uncultivated lay mind alcohol is alcohol, no matter what its front name may be, and when the possessor of such a lay mind wants a drink any old alcohol will do. There occurred lately an incident that bears this out. A miner entered an apothecary's establishment in western Pennsylvania and called for a certain bath alcohol that is advertised as efficacious for the purpose specified, but not to be taken internally. The apothecary asked the miner what he wanted it for. "I want it to drink," he replied, and the apothecary refused to sell it to him. Now the miner had a real thirst, and he knew better; he was going to beat this prohibition business anyway. So shortly afterward a tramp came in with the price to pay for a bottle of the same stuff, and he explained that he wanted to rub it on his knee, which he had sprained. He effected the purchase and, once outside the store, he handed it over to the miner, who immediately pulled the cork and took a grand swig at it. He was really thirsty. But in less than three minutes' time that miner was doubled up over a fence and in the throes of repentance. The denaturant was not deadly; for a time the miner wished it was; but it was only painful. A citizen of that type would not hesitate to drink methyl or propyl or butyl or any other alcohol so long as it bears the alcohol label; on the other hand he would not think of drinking methanol, because that is merely a chemical.

Gas masks are coming into use in industries, but the canisters must be prepared with special adsorbents, depending on the objectionable material present in the air. In some Mexican oil camps gases have killed men and mules and the ordinary gas masks prove useless. The principal trouble was caused by the H_2S , and the difficulty was met by the employment of helmets like those used by divers. There was trouble, however, in inducing the men to wear them.

Tuberculosis appears to be practically non-existent among workers in sulphur dioxide.

Skin troubles were observed to follow wearing khaki cloth produced by certain factories. It is suggested that the presence of some unchanged dinitrobenzene may have caused the trouble, which was met by washing the consequent eczema with a 2 per cent phenol solution.

A disease called "the purples" has been attributed to benzene fumes. This decreases the volume of white corpuscles in the blood so as to destroy the power of coagulation. The patient then bleeds from the mucous membrane and bleeds beneath the skin until death results.

An excellent emollient to protect the skin of users of dope and varnish is recorded taken from Circular 91, Educational Bureau, Paint Manufacturers' Association and National Varnish Manufacturers' Association in the U. S. It consists of lanolin, petrolatum, stearine and glycerine in equal parts by weight, and its use is recommended before starting to work and at the end of a shift, especially when coating compositions containing large amounts of organic solvents or thinners are used. In an important report by Dr. G. A. WELSH, medical officer to H. M. Factory at Gretna, picric acid is recommended as a dressing for acid burns.

In conclusion Dr. BASKERVILLE reported that with the assistance of W. H. PEARCE, librarian of the chemistry department of the College of the City of New York, abstracts of the current literature are now being compiled and that this matter will be available to members of the American Chemical Society.

Suggesting an Exhibit for The American Ceramic Society

IN AN article on "The Condition and Prospects of the British Ceramic Industry," by J. A. AUDLEY, published Jan. 31 in the *Journal of the Society of Chemical Industry*, the author says:

"There is still a demand for fancy goods, but not for inferior yet expensive ware which may be ranged in that class. As the world shortage of supplies gradually becomes satisfied and as international trade relations with Russia, Germany and other countries get restored, the vegetable and mineral exports from those places will have a powerful effect on the prices of similar commodities in America. This in turn will affect the prices of pottery, etc., purchased in America, from this country and elsewhere. It would therefore be wise for manufacturers . . . to concentrate their efforts on lines that are likely to be in continual demand, avoiding particular articles which will not be able to compete with cheaper, similar goods from other countries."

This advice to concentrate on quality in salable goods is sound, but salable goods is a broad term. Generally speaking, however, it means not only durable wares but those that are conceived and designed and wrought in good taste. It is quality that fixes good prices at first, after economic conditions are stabilized, and then, when industry at large meets the problem of quality, it is design which brings good prices and leadership in the market.

We venture the belief that American ceramic manufacturers can take time by the forelock in this respect, and make a step in advance of all others by a little judicious planning. Whether the industry is sufficiently developed here to have a great annual exposition or not we do not pretend to say, but we think it is. It might be initiated in connection with the meetings of the American Ceramic Society, just as the exhibits of the Steel Treathers and Foundrymen are arranged.

In the matter of design, so far as tableware and ornaments are concerned, we suggest that it would be wise to step out of the beaten track a little. The crockery and department store buyers think they know what they can sell and what has the reputation of being in

fashion, but that does not bring ideas into the business. Buyers are among the least imaginative of citizens. So we have a proposition to make; one that may be useless under present conditions, but our mind is open in this respect somewhat in the Scotch sense. We believe the National Academy, co-operating with the Art Division of the American Ceramic Society, would willingly appoint a jury of sculptors and painters to pass on the design of tableware and the like, and to award prizes for the best of each class. Then all such material as had been approved would have a certain *cachet*; it would be known to be in good taste. The exhibit should be broad in scope and include tapestry and face brick, art tiles, faience and all branches of ceramic industry in which expression of good taste in form and color make appeal to those who have the capacity to enjoy it.

Of course it is true that uncultured persons often have the most reprehensible likings and they buy dreadful stuff. The less we know the more certain we are, usually, that we possess that elusive quality which is the very gospel of culture. But most of us, no matter how ignorant we are, are rather sensitive in this respect, and we do not like to be classed among the ignorant. We like to have it said of us that we appreciate the right thing. The prize plates and dishes and also those that are approved would have in this approval a kind of good taste insurance. It might cost considerable for publicity to spread the idea abroad that wares approved by a jury of the National Academy of Design were being made and sold, but we think it would take with the public. The ambition for good taste and culture is so keen as to be no less than pathetic among our people. This would be a way to meet that desire and to get the market.

Science

Vs. Politics

TO UNDERTAKE to compete for the interest of the national professional politician by means of science might at first thought seem foolhardy. Yet science, or more particularly chemistry, is in real need of attention by our national legislators and it appears to be getting increasing attention, consideration and support.

One of the most encouraging signs of this development is the fact that the National Research Council was able to present in the Caucus Room of the Office Building of the House of Representatives the exhibit which has been on display for a short time in the headquarters of the Council. It is a most striking display of the relationship among fundamental science, chemical technology and important industrial developments of our nation. It touches upon problems of the dye industry, explosives manufacture, chemical warfare, nitrogen fixation, coking and byproducts and numerous other related and interrelated industries.

To set forth such an idea before our national legislators in their own office building is particularly fortunate. Perhaps as a result of this the Congressman may feel more at home with and realize more clearly his responsibility to the problems of chemical legislation which confront him. That he has afforded temporary relief to our chemical industries through the Knox amendment on the emergency tariff legislation is not enough, fine as that support may be. There still remain large and pressing questions for answer. It is well that a demonstration of some phases of this large problem can be brought so conveniently before him.

Inconsistencies in

Prices and Wages

WE ARE in the midst of an industrial depression and we are all anxious to see the way out. We have had other industrial depressions, many of them, in the United States, and we have always got out. Not a few books have been written about industrial depressions, and in their historical sections they generally undertake to show the cause of each depression and the cause of its ending. Usually the explanation appeals to the reader. Those who have personal recollection of industrial depressions have a different conception from that presented by the books. Their recollection is that while during a depression the causes thereof were perhaps correctly assigned, the influences that should be expected to end them were not clearly seen. The industrial prophets would tell the public how and when the patient was going to get well. The patient would get well but the causes of his getting well would prove different from those mentioned in the predictions.

It is now being said in some quarters that the present industrial depression is different from those of the past in that now men know precisely what they are waiting for. This may be true and it may not be true, but it is certain that men think they know. They assert and believe that they are waiting for lower commodity prices and lower wage costs, the latter item involving both the rate of payment per day or week and the quantity of service rendered in the day or week.

Assuming then that we are in the midst of a readjustment in prices and wages the completion of which will bring industrial activity and prosperity, the notable phenomenon today is the inconsistency between prices of different commodities and between wage rates for different classes of employment. We see common labor in the iron and steel industry paid as low as 30 or 33 cents an hour, in some cases without overtime payment for hours in excess of eight in the day, against 46 cents an hour in 1920 with time and a half for hours in excess of eight, while we see the artisans in the building trades in many communities demanding wages substantially as high as those paid in 1920 and generally ranging above a dollar an hour.

As to prices, the monthly presentments of the Bureau of Labor Statistics at Washington are presumably authoritative. The weighting of the various commodities to form an index number of "all commodities" at wholesale is partly a matter of judgment, and that need not concern us in this connection. The April index number, just announced, is 154, the 1913 average being 100. It is the inconsistencies between the groups of commodities that are pertinent to the present argument. With 1913 as 100 we have for last month:

Farm products	115
Food, etc.	141
Cloths and clothing.....	186
Fuel and lighting.....	199
Metals and metal products.....	138
Building materials	203
Chemicals and drugs.....	168
Housefurnishing goods	274
Miscellaneous	154
All commodities	154

The people are faced with the condition that housefurnishing goods are 274 while farm products are 115, and that building materials are 203 while metals and metal products are 138. The public is puzzled. Those of the public who are farmers are indisposed to buy at 203 or 274 when they have to sell at 115. The need for readjustment is more pressing than ever.

Readers' Views and Comments

Melting Non-Ferrous Metals

To the Editor of Chemical & Metallurgical Engineering

SIR:—In your March 23 issue M. A. Combs writes a very illuminating article upon the use of gas as fuel in furnaces for melting non-ferrous metals. In this article Mr. Combs, to his own satisfaction, neatly disposes of coke-, coal-, oil- or electrically-heated furnaces for the purpose mentioned, but the figures which he gives were obviously either selected for the purpose in hand or Mr. Combs was unfortunate, or fortunate, depending upon the viewpoint, in obtaining figures from plants employing very poor practice.

Mr. Combs states that "a furnace of 1,000-lb. capacity is used with gas as a fuel in foundries for red and yellow brass in smelting with wonderful results," then goes on to state that such a furnace required forty-two minutes to melt 1,100 lb. of metal, burning 310 cu.ft. of gas per 100 lb., which, figured at \$1.20 per 1,000 cu.ft., costs 37.2c. Also that on yellow brass, using such a furnace, the dross amounted to 3.74 per cent.

By comparison it is interesting to note that in a half dozen plants with which the writer is familiar, using electric furnaces, 2,000-lb. charges of a similar alloy are melted in less than forty minutes with a metallic loss less than 1 per cent and a cost for electric power less than 17c. per 100 lb. of metal melted.

Mr. Combs' statement is noted that in "comparing gas against electricity for melting furnaces the most striking advantage of gas after its economy is the flexibility of the furnace." The writer is familiar with a certain electric furnace installation in which one 2,000-lb. furnace has been used for melting pure copper, brass and bronze alloys, aluminum bronze and gray iron. It is not, however, contended that this wide diversity of alloys could be melted without a change in the refractory lining and I believe that any metallurgist or practical foundryman will readily agree that it would be suicidal to attempt to melt any difficult composition of copper or aluminum alloy on the same hearth as had previously been employed for melting high-lead or high-zinc alloys.

Herewith is offered a melting-cost-sheet taken from the books of a large manufacturer of brass and bronze castings using two rocking electric furnaces for the past thirty months:

STATEMENT OF ACTUAL MELTING COST

(As submitted by a manufacturing company using rocking electric furnaces during 1919-1920)

		Cost per Ton
Alloy melted: 85 per cent copper, 5 per cent tin, 5 per cent lead, 5 per cent zinc		
Power: 280 kw.-hr. per ton of metal melted at 1½c. per kw.-hr.		\$4.20
Electrodes: 3½ lb. per ton at 25c. per lb.		.88
Linings: 1,000 heats at \$200.		20
Labor: One man at \$6 per day	\$6.00	
½ man at \$5 per day	2.50	
	\$8.50	
\$8.50 over 6 tons		1.42
Incidentals: General maintenance, supplies, etc.		.50
		\$7.20
Metal loss:		
0.5 per cent, or 10 lb., per ton at 20c. per lb.		2.00
Total melting cost per ton, 2,000 lb.		\$9.20
Total melting cost per cwt.	\$0.46	

It will be noted that the total cost of melting the alloy shown is 46c. per cwt., which I believe shows sufficient saving over the figures given by Mr. Combs for coal, oil or gas to prove conclusively that the users of

the furnaces which he discusses should immediately take steps, as so many modern industrial plants are doing, to replace their present extravagant melting equipment with the electric furnace.

Effect of Manganese on Malleable Iron

To the Editor of Chemical & Metallurgical Engineering

Sir:—A few words of comment regarding the subject matter of Dr. Leuenberger's article on the effect of manganese on malleable iron, abstracted on page 751 of your issue for April 27, seem worth while.

The abstractor seems to have lost sight of the fact that the work bears no direct relation to the properties of malleable cast iron as made in this country. Both the original German article and your abstract indicate this quite clearly, although the evidence is probably not obvious to those not intimately acquainted with American malleable cast iron.

The table of analyses indicates carbon contents which would under American conditions of annealing result in extremely low tensile strengths. Furthermore, under these annealing conditions, which depend upon the separation of the carbon in the free state and not on its removal, the physical properties of the resultant product would be infinitely more affected by the variations in carbon content than by any moderate variations in manganese. Thus iron with an original carbon content of 3.18 would have a tensile strength of perhaps 38,000 to 40,000 lb. per sq.in., and iron with a carbon content of 2.6 would have a tensile strength of possibly 48,000 lb. per sq.in.

The silicon values quoted are so low that a graphitizing anneal would be practically prevented. The sulphur values are approximately in line with American practice, but both the physical properties and the extremely energetic heat-treatment by which these properties are attained indicate that the annealing has been done by decarburizing and not by graphitizing.

With the American graphitizing anneal those irons having a manganese content of 0.66 and above in the investigator's table would hardly have shown any ductility at all. In fact the results would have been approximately as indicated in the data for the first heat-treatment reported upon. The fact that the ductility increased with subsequent heat-treatments and the strength decreased is an evidence of the further removal of the continued carbon by oxidation. This letter is, therefore, prompted by a desire to point out that those interested in American malleable cast iron should not rashly apply Leuenberger's data to American conditions, as in that manner untold confusion and no useful improvement would result. This confusion between the American and the European practice has already been a source of much vexation in this country, and a further obscuring of the matter is much to be deplored.

May I refer to a series of articles now appearing in the *Iron Trade Review* on American malleable cast iron for a more extended discussion of the difference in principles and practice between American and European malleable plants?

H. A. SCHWARTZ,

Manager of Research,
National Malleable Castings Co.

Cleveland, Ohio.

F. M. Feiker to Join Department of Commerce

F. M. FEIKER, vice-president and chairman of the editorial board of the McGraw-Hill Co., has been appointed assistant to the Secretary of Commerce, with duties and relations of greatest significance to business publications.

Briefly Mr. Hoover has divided the bureaus of the Department of Commerce into two parts. Assistant Secretary Huston will supervise the bureaus relating to navigation and fisheries, while Mr. Hoover will give his personal attention to the bureaus of Foreign and Domestic Commerce, Standards and Census. Mr. Feiker will directly assist Mr. Hoover in the expansion of these bureaus as aids to business.

The immediate problem is to find out what kind of facts and figures industry needs from the Government by means of a series of conferences with the representative men of industry. Having organized the department to function according to the requirements, the next problem is to devise an adequate system of clearing the collected data back to business. It will be apparent at once that with Mr. Feiker's background of engineering training; his viewpoint on the needs of industry and his sense of publicity, he will be in a position to render unusual service in the furtherance of Mr. Hoover's plans.

It is Mr. Hoover's purpose to develop the Department of Commerce so that it will have the same relation to business that the Department of Agriculture now has to the farmer. In other words, he feels that its function is to aid industry, not to regulate or control it. Considering his intimate knowledge of foreign conditions, his masterful grasp of economic principles, and his present official position, a most optimistic view of the developments in prospect is justifiable.

It is well known to those who have been close to the Department of Commerce that Mr. Hoover has been looking all over the country to find a man suitable for the work he has in mind. The invitation, which came to Mr. Feiker first over the long-distance telephone from Washington, was a distinct surprise. The full importance of the position and the opportunities which it offers were not made clear until Mr. Feiker had an opportunity to have a full discussion of the proposed work with Mr. Hoover. It is significant that Mr. Hoover has a keen appreciation of the fundamental service rendered by the business press. Considering the fact that he is the first engineer to have a place in the Cabinet or the Department of Commerce, it is evident that engi-

neers and engineering thought are destined to play a more important part in the business of the country than ever before. Many other developments are making clear that the engineer is taking a new place in the world and industry.

Mr. Feiker is a graduate in electrical engineering of the Worcester (Mass.) Polytechnic Institute, class of 1904. Following his graduation he assisted in special research work in high-tension transmission and generation at Worcester. From 1906 to 1907 he served the General Electric Co. at Schenectady, N. Y., as technical journalist, and in the latter year went with the *System* magazine at Chicago, shortly afterward developing the idea of *Factory* magazine, of which he became managing editor. In 1912 he was appointed chairman of the editorial board of all the A. W. Shaw

publications. He left Chicago in 1915 to join the McGraw organization in New York as editor of *Electrical World*. In the year following he established *Electrical Merchandising*, to supplement and extend the service of *Electrical World* to the industry. In 1919 he was made editorial director of the McGraw-Hill Co., and in January, 1920, was elected vice-president and chairman of the board of editors of its eleven publications.

Mr. Feiker is a member of the American Institute of Electrical Engineers, the American Society of Mechanical Engineers, the American Association of Engineers, the National Electric Light Association, the Illuminating Engineering Society and other technical societies, and is prominent in the committee work of these associations. During 1920 he served as chairman of the Editorial Conference of the New York Business Publishers Association.

He is a member of the Engineers' Club of New York, the City Club, the University Club of Chicago and the Cosmos Club.

Mr. Feiker will not sever his connection with the McGraw-Hill Co., but will be given an indefinite leave of absence.

In a statement of the purposes of his new work, Mr. Feiker said: "I hope to be able to assist Mr. Hoover in the development of the statistical and research branches of the Government in such a way as to provide information and help for the needs of the average business man and the small manufacturer who have neither the opportunity nor the capital to get the information individually. The Government's functions in the collection of fundamental data and trade information can be put to their service in a definite and practical way. I am keenly interested in Mr. Hoover's broad plans to develop the Department as an aid to industry."

FRED M. FEIKER

Bureau of Mines Cryogenic Laboratory Dedication

THE new Cryogenic Laboratory of the U. S. Bureau of Mines was dedicated by Mme. Curie as a part of the celebration of the visit of this famous scientist to Washington. Addresses were delivered upon this occasion by Secretary Fall, the Director of the Bureau and Dr. R. B. Moore, chief chemist, in charge of the laboratory. Mme. Curie, in addition to delivering the dedicatory address, also pressed the button which set in motion the machinery for the first formal operation of the equipment in the new laboratory. Participating in the affair were the Mme. Curie Reception Committee of Washington, various Government officials and representatives of the Army, Navy and scientific departments of the federal establishments interested.

The new laboratory, which is to be operated under the appropriations of the military departments by allotment by the Helium Board, is to take up the work required for determination of scientific data of fundamental interest, especially in connection with the operation of Government helium plants. The earlier history of this work and the description of the new laboratory equipment is given by the bureau in the following language.

NEED FOR THE RESEARCH LABORATORY

When the helium plants were started in 1918, owing to the pressure in connection with all war undertakings there was no time nor opportunity to do any research work on a small or semi-commercial scale. It was necessary to design and build the plants as rapidly as possible and to do whatever experimentation was required in the plants themselves. Shortly after the two experimental units at Fort Worth were operating, the advisability of research work in connection with the undertaking was plainly seen, and some vapor pressure work was started at the Bureau of Standards under a co-operative arrangement with the Bureau of Mines and the Army and Navy. Last year arrangements were made with Dr. Harvey N. Davis, of Harvard University, and Dr. F. G. Keyes, of Massachusetts Institute of Technology, to do further work along this line, and this is now in progress. There is, however, a distinct addition in having a thoroughly equipped laboratory which is available at all times for research work in connection with the plants and this has been accomplished through the establishment this year in the Bureau of Mines at Washington of a Cryogenic Laboratory. The funds were allotted to the Bureau of Mines last June through the interest of Commander A. K. Atkins, of the Navy, and Colonel C. DeF. Chandler and Lieutenant R. S. Olmstead, of the Army Air Service, and at the present time Lieutenant Commander S. M. Kraus and Major P. E. Van Nostrans are acting for the Navy and Army respectively under the co-operative agreement with the Bureau of Mines.

EQUIPMENT

The equipment is now installed in the new Department of Interior Building at Washington. It consists of two 4-stage Norwalk air compressors, rated at 75 cu.ft. of free air per min. each, compressed to 3,500 lb. per sq.in. at 135 r.p.m. These compressors are driven by two 50-hp. variable speed, 220-volt d.c. motors. These compressors will be used for making liquid air and for obtaining the necessary refrigeration for other purposes. From 15 to 20 liters per hour of liquid air can be obtained. In addition there is one three-stage submarine

type compressor, rated at 28.87 cu.ft. of free gas per min. at 150 r.p.m., compressed to 3,000 lb. per sq.in., and driven by a 15-hp. variable speed, 220-volt d.c. motor; also one three-stage submarine type compressor, rated at 16 cu.ft. of free gas per min. The first one will be used for liquefying hydrogen and the second for a liquid helium cycle. All the compressors have unloading valves so that the capacities can be varied within wide limits.

There are two 300-cu.ft. and one 200-cu.ft. gas holders for holding hydrogen and helium; four smaller holders for storing gas samples; a machine shop equipped with 13-in. engine lathe, bench lathe, shaper, two drill presses, grinders, pipe tools, etc. There are also available one Air Reduction low temperature expansion engine, air and hydrogen liquefiers, and the necessary physical and chemical apparatus to go with the above equipment.

The object of the laboratory is twofold. Its first and main object is to obtain scientific data that will be of use in the operation of the helium plants so as to get more efficient operation and reduce the cost of helium production. Its second and subsidiary use is to furnish facilities to a limited number of American scientists who may be interested in using the laboratory for special low-temperature work, particularly along lines that will not be covered by the technical men of the Bureau of Mines.

VAPOR PRESSURE STUDIES AND CHARCOAL PURIFIERS

At the present time the work that is being carried on is along two definite lines. First, vapor pressure work in connection with ternary mixtures, and second, in connection with the purification of helium by means of charcoal at low temperatures. It has been found that charcoal at low temperature has a selective action on nitrogen, absorbing this gas, but not absorbing helium, or at least to only a very small extent. This property has been adapted to purifying helium both from nitrogen and from air.

The Army has constructed a repurification outfit on two railroad cars. The first car contains the power plant, and the second car contains the compressors and refrigeration equipment. The Bureau of Mines has been asked to design and install a charcoal repurification unit on this car, and this work is now under way, the equipment being partly constructed in the Cryogenic Laboratory, and the whole will be tested out in this laboratory before installation in the car. If this work is a success it is probable that it will be of sufficient value to install in the production plants also in order to step up the cruder product which is obtained in the plants to 100 per cent helium, which can be obtained by means of the charcoal. The importance of having the higher product is exceedingly great, as a dirigible filled with 100 per cent helium rather than 94 per cent will have a much greater lifting power and also a wider range of operations.

PERSONNEL

This laboratory is under the direct charge of Dr. R. B. Moore, chief chemist of the Bureau of Mines, and the technical personnel consists of J. W. Davis, mechanical engineer, of Cornell University and the University of Illinois; C. W. Seibel, physical chemist, of the University of Kansas; Dr. A. G. Loomis, physical chemist, of the universities of Missouri and California; and Dr. L. Finkelstein, physical chemist, of the Armour Institute of Technology and the University of Chicago.

Recovery of Volatile Solvents by the Bregeat Process

Descriptive Study of the Application of Phenolic Absorbents — Theoretical Considerations—Equilibrium Curves at 20 Deg. C. Between Cresol and Ether, Ethyl Alcohol, Methyl Alcohol, Acetone and Benzene—Influence of Water Dilution of Absorbent—Operation Data

BY M. ROULLEUX AND ROBERT G. DORT

WHEN a gaseous mixture containing solvent vapor is in contact, for a sufficient length of time, with a certain quantity of an absorbent in a closed vessel, the solvent vapor is partly absorbed from the gaseous mixture into the absorbent. The partial pressure of the solvent vapor in the gaseous mixture decreases, while the vapor pressure from the solvent in the enriched absorbent rises from zero up to the point where the vapor tension of the solvent in the absorbent and the partial pressure of the solvent vapor in the gaseous mixture meet at the same value. There is thus reached a state of equilibrium, which is characterized by two factors: The concentration of the solvent vapor in the gaseous mixture (which is a direct function of the partial pressure of the solvent vapor in the gaseous mixture), and concentration of the solvent in the absorbent.

A good absorbent must show a high ratio between the concentration of the solvent in the liquid phase (i.e., in the absorbent) and the concentration in the gaseous phase when the system is at equilibrium. It is obvious that the higher this ratio the lower the amount of solvent vapor remaining in the gas, other things being equal.

This ratio can be expressed in an experimentally

FIG. 1. GENERAL REPRESENTATION OF THE ABSORBING POWERS OF TWO ABSORBENTS

determined curve (see Fig. 1) giving one concentration as a function of the other under equilibrium conditions. For illustration, two arbitrary curves marked "Absorbent M" and "Absorbent N" have been drawn. If OA represents the concentration of solvent vapor in a particular gaseous mixture, then the highest possible concentrations of the solvents in Absorbents M and N are represented respectively by OB and OC. The ratio

OC : OB represents the superiority of Absorbent N over M so far as absorption is concerned.

ABSORPTION BY PHENOLIC ABSORBENTS

The advantage of employing as a liquid absorbent one consisting essentially of phenols was discovered, first appreciated, patented in France, the United States, Germany and elsewhere, and first put into industrial use by J. H. Bregeat.

In the commercial and industrial application of the Bregeat process for solvent recovery, crude cresol is generally used, containing, for example, about 97 per cent phenolic products. Such crude cresol is, in general, a mixture of three isomeric cresols, $C_6H_4CH_3OH$ (ortho, meta, para), obtained from coal distillation.

FIG. 2. ABSORBING POWER OF VARIOUS ABSORBENTS FOR ETHER AT 20 DEG. C.

The industrial absorbent employed usually contains about 35 per cent ortho cresol, 40 per cent meta cresol and 25 per cent para cresol, and distills between 190 and 220 deg. C. The specific gravity of this absorbent is about 1.04; the specific heat is about 0.6.

The concentrations which may be reached by the use of the cresols as absorbents for several industrial solvents are illustrated in the figures.

In Fig. 2 curves have been drawn showing the absorbing powers¹ for ether of 66 deg. Bé. sulphuric acid, Bregeat absorbent (cresols), amyl alcohol and petroleum

¹Copied from a report from the French "Ministère de la Guerre, 6e Direction, Poudres" entitled "Etude Théorique sur Différents Procédés de Récupération des Vapeurs Ethero-Alcooliques en Atmosphère Diluée."

oils. (All curves are based on observations at 20 deg. C.) The seeming superiority of concentrated sulphuric acid as an ether absorbent is marked. This superiority is, however, only apparent and is negated by numerous serious objections and industrial inconveniences, as will be briefly explained hereinafter. These curves for ether absorption show clearly the superiority of the cresols over amyl alcohol and oils as absorbing mediums. It might be added that the use of amyl alcohol is ruled out by its extremely toxic effect on the workmen and by its prohibitive price.

Fig. 3 shows the curve indicating the absorbing prop-

FIG. 3. ABSORBING POWER OF THE CRESOLS FOR ETHYL ALCOHOL

erties¹ of the cresols for ethyl alcohol. It will be noted that as the concentration of alcohol vapor in the gaseous mixture rises, the possible concentration of alcohol in the cresols rises very rapidly. It is proper to conclude that the cresols are very good absorbing media for ethyl alcohol.

Fig. 4 shows the curve for the absorption¹ of benzene by the cresols.

Fig. 5 represents curves showing the concentrations of such pyroligneous solvents as acetone and methyl alcohol in a gaseous mixture, and the possible concentration of these solvents in the cresols. This application will become important in the wood distillation (wood charcoal) industry.

It is of interest to note that the solvents represented in the curves represent a wide range of industry. Ether is used, for instance, in the manufacture of artificial silk and smokeless powder. Ethyl alcohol is used in the manufacture of artificial silk, gas mantles, artificial leather, celluloid, smokeless powder, and is probably lost in considerable amounts from the vats of fermentation plants. Benzene is used particularly in the manufacture of artificial leather and rubber goods; the possibilities of more complete recovery of benzene from coke-oven gas are large. Acetone and methyl alcohol are used, for instance, in the manufacture of films, airplane dopes, explosives and lacquers.

INDUSTRIAL ABSORPTION

In industrial practice the liquid absorbents have the important advantage of allowing the carrying out of the absorption on the countercurrent principle, in which both gaseous mixture and absorbent are made to flow in intimate contact with each other in opposite direc-

tions. By the use of this principle equilibrium between the concentrations of the solvent in the absorbent and in the gaseous mixture is no sooner approached than conditions are mechanically changed in such a way that further absorption is required in order to approach equilibrium again. That is to say, a certain particle of absorbent which has approached equilibrium with the gas surrounding it is being constantly and mechanically moved forward into a new gaseous mixture where the concentration of the solvent vapor therein is higher than in the previous position. As a result of this change the particle of absorbent must pick up more solvent vapor from the gaseous mixture before equilibrium is again approached. When the absorbent leaves the scrubbing apparatus the concentration of the solvent in the absorbent corresponds practically to the maximum obtainable from the gaseous mixture entering the apparatus, provided the scrubbers have been correctly designed. When the gas leaves the scrubbing apparatus it has just been in intimate contact with fresh absorbent, this resulting in the absorption from the gaseous mixture of practically the last traces of solvent vapors, again provided the scrubbing apparatus is correctly designed.

This results in the possibility of obtaining the highest possible concentration of the solvent in the absorbent, together with practically complete absorption. Moreover, this principle allows the reduction of the size of the scrubbing apparatus—i.e., the wetted surface of the scrubbers—to a minimum, other things equal.

Any liquid absorbent theoretically allows obtaining a complete absorption. It is only a question of using a sufficient flow of absorbent in a scrubbing apparatus of sufficient size. But a poor absorbent will lead to the use of a large flow of liquid together with large scrubbers, while a good absorbent allows the reduction of both absorbent flow and apparatus size. From this

FIG. 4. ABSORBING POWER OF THE CRESOLS FOR BENZENE

point of view the cresol absorption curves (see Figs. 2, 3, 4 and 5) show the advantage of this absorbent, but they do not bring out any of the other advantages of the cresols as absorbents.

The importance of these other advantageous properties is emphasized by the disadvantageous properties of sulphuric acid. The absorbing power of sulphuric acid

for ether and alcohol (as shown in Fig. 2) has attracted many. But up to the present sulphuric acid has failed to prove a commercially good absorbing medium, because its high absorbing power is its only advantageous quality. All its other properties are constant sources of inconvenience. The industrial handling of a large quantity of sulphuric acid requires lead or lava containers, piping, scrubbers, etc. The absorbing power of sulphuric acid is greatly lowered by the presence of water in the air treated. Furthermore, after stripping, the previously diluted sulphuric acid must be reconcentrated, which also prevents the process from being continuous. The sulphuric acid process, moreover, does not always

FIG. 5. ABSORBING POWER OF THE CRESOLS FOR ACETONE AND METHYL ALCOHOL

return the absorbed solvent in its original state—ether is partially transformed to alcohol, for example.

All this shows why the Bregeat process has always been able to establish its superiority over the sulphuric acid process whenever there has been a fair competition between them.

Besides its high absorbing power, the Bregeat absorbent has many other advantages, among which the following may be mentioned:

The cresols have no corrosive action whatsoever on the usual apparatus materials, such as steel, copper, brass and concrete.

Large variations in the concentration of the solvent vapors in the gaseous mixtures—a condition generally found in solvent recovery problems—do not affect the efficiency of the Bregeat absorbent; that is to say, there seems to be a distinct hysteresis effect in the evolution of solvent vapors from the cresols at ordinary temperatures and pressures (though this may be the case with other absorbents to a lesser degree). The reduction in the concentration of the solvent vapors in the cresols seems to follow only with a considerable lag the reduction in the concentration of the solvent vapors in the gaseous mixture above it. This means that when the Bregeat absorbent, concentrated to a certain point in solvent, comes into contact (always assuming normal temperature and pressure) with a gaseous mixture much less concentrated in solvent vapor than that which has

previously surrounded it, the cresylic absorbent does not at once attain equilibrium by losing, to a certain extent, its absorbed solvent.

This hysteresis (lag) effect would go some way toward explaining the remarkable success which the use of the Bregeat absorbent has had in treating gaseous mixtures, the concentration of which in solvent vapors varies very suddenly and through wide ranges. For instance, in one of the Bregeat industrial plants the concentration of ether alcohol in the gaseous mixture being scrubbed varied from zero to 50 g. per cubic meter within five-minute intervals, and sometimes more often. Fig. 6, which shows the varying concentration² of ether-alcohol vapor in the gaseous mixtures from presses manufacturing smokeless powder (Poudre "B"), illustrates clearly the type of gaseous mixtures which the Bregeat process handles very successfully.

The observation of this hysteresis effect supports the opinion that the absorption of various solvents by the cresols involves something more than mere solution. Some kind of a molecular association or complex, easily broken down by heat, seems to result. Full and accurate data on this point are still lacking. Certain indications³, however, aside from the hysteresis effect, do seem to tend toward the idea that something more than simple solution takes place.

The cresols also have the important property of not being greatly affected by the absorption of water vapor. Under average plant conditions (humidity) the cresol will not absorb more than 2 per cent of water from the air. The small effect that this amount of water has upon the absorbent effect of cresol for ether, for instance, is shown² in Fig. 7. In fact in industrial practice

FIG. 6. CONCENTRATION OF ETHER-ALCOHOL IN GASEOUS MIXTURES ESCAPING FROM "B" POWDER PRESSES

small amounts of water are sometimes added to the cresols in order to create a condition which is very favorable for stripping.

The cresols are good absorbents for many different

²Copied from a report from the French "Ministère de la Guerre, 6^e Direction, Poudres" entitled "Etude Théorique sur Différents Procédés de Récupération des Vapeurs Ethero-Alcooliques en Atmosphère Diluée."

³In *J. Am. Chem. Soc.*, vol. 9, pp. 1949-1977 (September, 1917), in a paper by Messrs. Hatcher and Skirrow, dealing primarily with compounds of phenol and cresol with pyridine, it is stated (p. 1953) that when the molecular weight of ortho and para cresol dissolved in benzene is determined by the freezing point method, their molecular weights are found to be smaller than the formulas would indicate. In explanation of this phenomenon the authors state: "Possibly this may be due to combination with the solvent" (benzene). It is also stated in this paper that the same phenomenon has been observed by Amwers, (*Z. physik. Chem.*, vol. 12, p. 689, 1892).

substances used as solvents. This property is of utmost importance in those solvent recovery problems where several kinds of solvents are used simultaneously, successively or in different operations.

The vapor tension of cresol at ordinary temperatures is very low. This means that under average industrial conditions the gas leaving the scrubbers carries only a trace of cresol vapor.

The cresols easily lose their absorbed solvents when heated up to a temperature which never needs to be over 150 deg. C. This temperature is conveniently obtained by the use of steam, at 100-lb. pressure.

FIG. 7. INFLUENCE OF WATER UPON ABSORPTION

The Bregeat absorbent returns the solvents absorbed therein without alteration and in about the same proportion as that in which they were absorbed.

INDUSTRIAL APPLICATION

Besides the use of a new absorbent the Bregeat process involves the continuous operation of a very efficient apparatus. The Bregeat apparatus is, in many respects, similar to that employed in the debenzolization of coal gas. It (the Bregeat apparatus) has been designed for the employment of cresol to realize the special advantageous properties of this absorbent. In some cases where the solvents have to be separated from one another or from water (if one or more solvents are miscible therewith), the equipment is completed by a continuous rectification apparatus from which these solvents are automatically obtained in the desired state of purity. The types as well as the proportion of the various pieces of apparatus have been carefully studied in view of obtaining the maximum efficiency (percentage recovered) together with the minimum first cost and minimum operation cost.

The general operation of a Bregeat installation is shown schematically in Fig. 8. This diagram is typical of the system, although conditions in each individual installation govern the design of the scrubbing apparatus, and to a greater extent that of the rectification apparatus. In detail, the Bregeat process, as represented in Fig. 8, is as follows:

COURSE OF THE AIR-SOLVENT VAPOR MIXTURE

The course of the air-solvent vapor mixture is indicated on Fig. 8 by arrows with dotted shafts. The air-solvent vapor mixture enters the system at the base of the second scrubber, rises through this scrubber, meeting the descending absorbent. From the top of the second scrubber the air-solvent vapor mixture goes to the bottom of the first scrubber, rises through this, meeting the descending fresh absorbent. From the top of the first scrubber the air, now deprived of all solvent vapors, is discharged into the atmosphere.

COURSE OF THE ABSORBENT IN THE SCRUBBERS

The course of the absorbing liquid is indicated in Fig. 8 by arrows with solid shafts. The absorbent stored in the absorbent storage tank marked "Fresh Absorbing Liquid" is pumped to the top of the first scrubber, where it descends, meeting the rising air-solvent vapor mixture already partly deprived of its solvent vapor by scrubbing in the second scrubber. From the bottom of the first scrubber the absorbent is taken to a pump, whence it is raised to the top of the second scrubber. In this scrubber the gaseous mixture containing the solvent vapors is met by the down-flowing absorbent as in the first scrubber.

COURSE OF THE ABSORBENT IN THE STRIPPING APPARATUS

From the bottom of the second scrubber the absorbent, now containing the solvent, is raised by a pump to the regulating tank. (This regulating tank is connected with a pipe marked "Overflow" through a pipe line leading to the absorbing liquid tank. This is only for use should some stoppage occur in the absorbent line beyond the regulating tank.) From the regulating tank the absorbent goes to the heat exchanger, where it is partly

FIG. 8. FLOW SHEET OF THE BREGEAT SOLVENT RECOVERY SYSTEM

heated by hot absorbent coming from the stripping still. From the heat exchanger the absorbent goes to the preheater, where it is heated to about 150 deg. C. by steam coils. From the preheater the absorbent goes to the stripping still (marked "Still" on Fig. 8), where it is heated further. The solvent vapors are driven off from the absorbent here. The absorbent, now freed of solvent vapors, and hot, flows down through the heat exchanger, where it heats the cool, fresh incoming

absorbent. From the heat exchanger the partly cooled absorbent goes to the "Absorbing Liquid Cooler," where it is cooled to about room temperature and thence it flows to the absorbent storage tank.

COURSE OF THE SOLVENT VAPOR STRIPPED FROM THE ABSORBENT

From the stripping still the solvent vapors go to the dephlegmator, where a certain amount of separation and rectification takes place. From the dephlegmator the solvent vapors go either to a continuous rectifying column—if the solvent is miscible with water or if there are several solvents to separate from one another—or to a condenser, then to a cooler, and then to a decanter, if the solvent is not miscible with water. If a rectifying column is used, the vapors from the rectifying column pass into the condenser, whence their course is the same as in the case of the solvents condensed without rectification.

Temperature- and pressure-recording devices, as well as test glasses and test pet cocks, are placed throughout the system.

On Fig. 8 the course of cooling water is indicated throughout by an arrow with an "o" midway up the shaft.

INDUSTRIAL RESULTS OBTAINED BY THE BREGEAT PROCESS

The Bregeat process was discovered and developed industrially in France during the war. At that time the inventor directed all his activity toward the war industries (manufacture of smokeless powder and application of airplane dope), which opened up a very large field for the process. In France alone the consumption of alcohol

for smokeless powder attained a figure of about 20,000 tons per month; the consumption of various solvents for airplane dopes (benzene, ethyl acetate, acetone, methyl alcohol, etc.) attained a figure of 550 tons per month in the middle of 1918.

The first industrial apparatus for the recovery of volatile solvents by means of the Bregeat system was started at the beginning of 1917 at the powder works of Sevran (near Paris). This apparatus, which was built at the expense of the inventor, was furnished only with very lean gaseous mixtures, taken from the atmosphere of the workrooms without any collecting devices whatsoever. In fact the concentration was about 5 g. of ether-alcohol per cubic meter of gaseous mixtures—a very low figure. At the same time at Sevran there was being tried out a process for the recovery of solvent by sulphuric acid (Barbet) and another process by compression-refrigeration (G. Claude).

The Bregeat process proved so successful that the French Government decided to equip all French powder works with it. Table I shows the dates of erection of the various Bregeat plants in France and in England during the war. It will be seen from the dates of putting into operation that little time was lost after the successful Sevran tests that demonstrated the worth of the process. In England sixteen sulphuric acid recovery units were discarded and replaced, or were in the course of being replaced at the time the armistice was signed, by the Bregeat process in various English explosives works.

Since the war contracts have been signed in France, Belgium, England and Germany with film works, coke works, artificial silk works, artificial leather works and explosives works for the recovery of solvents by the

Bregeat process. Several of these plants are now operating or in the course of being put into operation, among which the following may be mentioned: Pathé Frères, Vincennes (France), (film manufacture); Mines de Carmaux (France), (debenzolization of coke-oven gas); Michaut-Masson, Clichy (France); Jenatzy-Leleux, Brussels (Belgium), (both above manufacturers of coated fabrics); Obourg (Belgium), (manufacturers of artificial silk by the collodion process); Caulille (Belgium), (explosives); Leto-photo, Edgeware, Middlesex (England), (film).

The gaseous mixtures treated in these plants are often very lean—of a concentration of only about 8 to 15 per cent per cubic meter—and in some cases these gaseous mixtures are subject to large fluctuations in concentration of solvent vapor, frequently in very short periods of time.

OPERATION DATA ON THE BREGEAT PROCESS

The accompanying facts and figures (Table II) taken from an official report of the French Government on the operation of the Bregeat process at the explosives works of Ripault (near Tours, France) are given as an illustration of the operation of the Bregeat process in France.

The volume of gaseous mixtures treated was about 12,000 cu.m. per hour at average room temperature. The concentration of ether-alcohol vapors in the air averaged 8 to 10 g. per cubic meter; with regard to this it is to be noted that these gaseous mixtures were taken from the vicinity of the presses and mixing machines, the rich mixtures from the drying ovens being treated by a condensation process already installed. In normal and continuous operation about 90 per cent of the ether-alcohol vapors entering the Bregeat apparatus were re-

TABLE II. CONSUMPTION OF ELECTRICITY, STEAM, WATER AND ABSORBENT PER KILO OF ETHER-ALCOHOL RECOVERED AT RIPAUT (EXPLOSIVES WORKS), TOURS, FRANCE

Items	First Period Consumption	Second Period Consumption	Third Period Consumption	Fourth Period Consumption	Average Consumption
Labor, hr.	0.0116	0.0144	0.012	0.0196	0.144
Electricity, kw.-hr.	0.111	0.13	0.104	0.1694	0.1286
Steam, kilos.	4	7.34	4	4	4.835
Water, cu.m.	0.12	0.2	0.16	0.28	0.19
Absorbent, kilos.	0.085	0.113	0.092	0.149	0.11

covered separately in the liquid form as 65 deg. Bé. ether and 96 deg. Gay-Lussac alcohol, both immediately re-employable in the manufacture.

In Table II the consumption of steam, water, electricity, absorbent and the amount of labor required are set forth.

In 1917, when this Ripault plant was built, the first cost of installation for the recovery of approximately 2,500 kg. of ether-alcohol per twenty-four hours was about 150,000 f. Figuring the interest on this sum at 10 per cent and with an addition of 4 per cent per year for taxes, insurance and maintenance, the resultant average net operating cost per kilo of solvent recovered for Ripault was 0.337 f. per kilo.

The Ripault (Ancienne) apparatus, described above, was one of the earlier and smaller recovery installations. The Bregeat installations in many of the other explosives works in France and in England were much larger. At Gretna there was the largest solvent recovery system in the world, which, although not designed by the

Bregeat engineers, utilized the Bregeat absorbent. And even under the far from favorable conditions obtaining there, the Bregeat system was so satisfactory that the sulphuric acid process was replaced elsewhere in England.

SUMMARY

The history of solvent recovery is one of individual effort, unco-ordinated endeavor, and delusion. Until the Bregeat process had been developed solvent recovery was not an industry by itself. The Bregeat process is responsible for bringing solvent recovery out of the class of an incidental and casual art into that of an independent and well-established business. This is due to the fact that it is the first solvent recovery process to be general in its application.

No longer does the American manufacturer consider the resources of the country inexhaustible. Competition is growing increasingly severe. Conservation of existing materials, recovery or recuperation of materials previously wasted are acquiring rightfully an ever more important place in industry. In the United States, where many manufacturers utilize and to a large extent lose volatile solvents, the opportunity is obviously large for an industrially proved solvent recovery process, one which applies to all cases, such as the Bregeat process.

Pig Iron Production in France

France's production of pig iron before, during and since the end of the war, has been as follows:

	Tons
1913	5,207,197
1916	1,447,000
1917	1,684,000
1918	1,297,000
1920	3,317,371

Of this 3,289,318 tons was made with coke and 28,053 tons in electrical furnaces.

The distribution of this production according to the various types of pig iron before the war and at present is as follows:

	1920 Tons	1913 Tons
Cast iron	797,939	953,683
Refined pig iron	275,153	532,003
Bessemer pig iron	76,289	124,336
Basic pig iron	2,050,129	3,508,837
Special cast iron	117,861	88,328

According to the estimates of industrial engineers, when France has completed the work of reconstruction and is again able to turn to the normal development of her industries, she will be able to produce 11,000,000 tons of pig iron per annum, or 282 kilos per capita, as compared with 132 kilos in 1913.

In 1913 France consumed 5,144,000 tons of pig iron. In 1920 she consumed 2,993,371 tons.

France's exports and imports of pig iron in 1913 and 1920 were as follows:

	1913 Tons	1920 Tons
Exports	148,000	306,000
Imports	70,000	132,000

Alsatian Potash Production During 1920

The total production of Alsatian potash during 1920 reached 1,061,197 tons, according to statistics received from the office of the commercial attaché, Paris. Of this amount 450,000 tons was sold in France, 327,000 tons was exported to the United States, 117,000 tons to Belgium, and 92,000 tons to the United Kingdom.

Ductile Electrolytic Nickel*

An Outline of the Experimental Work on the Electrolytes, Cathodes and Anodes Leading to the Production of Electrolytic Nickel of Greatly Improved Mechanical Properties

By CHARLES P. MADSEN†

THE general failure to produce alloys for electrical heating purposes by metallurgical means which would come outside of the patent situation developed in 1916¹ led to the conception that a better type of resistance alloys and armors for heating units could be made by electrodeposition. It was believed that nickel or cobalt would be the best major ingredient and it was taken for granted that disclosed processes for making heavy deposits of these metals produced the results claimed. A few trials, however, soon showed this belief concerning nickel to be an error. In some cases claimed results of the inventor could not be reproduced, while in others a heavy deposit could be obtained only once in the same electrolyte, and in all cases the metal produced was mechanically very imperfect and became even more brittle after heating.

Attention was then turned to cobalt, and better results were obtained but not perfect enough to warrant the added cost. A more thorough review of the nickel art was then made and research instituted for determining the factors governing the production of heavy and mechanically perfect deposits of nickel.

All known baths were tried and particularly was Dr. O. P. Watts' review² followed carefully. The work has occupied a period of over five years, during which time several thousand deposits of $\frac{1}{2}$ in. (0.8 mm.) thick and over have been made. It has, however, been carried out largely by empirical methods, and sufficient data have not yet been obtained for formulating the physical factors on a scientific basis. However, practical results have been produced, which appear worth while recording at this time.

This paper is therefore intended only as a report of the general work done and how the result was obtained, and it is hoped that the physical data can be standardized at an early date and be made the subject matter of a subsequent paper.

ELECTROLYTES

The early work was concentrated upon the electrolyte, and the results were so erratic and inconstant that the following general conclusions were drawn:

First. The usefulness of any nickel electrolyte can be determined only after its entire metal content has been replaced from the anode.

Second. No conclusion can be drawn from deposits less than 0.01 in. (0.25 mm.) thick.

Third. Reports of results with any electrolyte are of no value, without knowing the exact analysis of the anode used.

It was found that no electrolyte would entirely fulfill the first condition with any type of commercial anode, and the results were therefore variable. The so-called 97-98 per cent cast anodes containing manganese were found to deteriorate the bath most rapidly, while anodes of the same nickel percentage containing tin performed little better and introduced the difficulty of forming metastannic acid under certain conditions. On the other hand, it was found that while the so-called 92-96 per cent cast anodes containing iron maintained the bath nearly constant, although their efficiency was rarely 100 per cent on their nickel content, the large amount of ferric hydrate caused considerable difficulty in making heavy deposits. It was also found that the ratio of the anode to cathode surface was more important than usually supposed and was apparently a function of the anode composition. It was in all cases necessary to have from two to five times greater anode surface than that of cathode, and in some cases from ten to fifteen times.

ANODES

Attention was then turned to the use of relatively pure nickel metal as anodes. Some investigators state that pure nickel is passive, while others claim good results with its use as anodes. Imported pure nickel made by Fleitman³ and Pfanstiehl were tried, also hot-rolled nickel and electrolytic nickel made by the International Nickel Co., as well as domestic so-called cold-rolled malleable nickel. In these cases it was found necessary to have some chloride present, but a limit was found beyond which any further chloride addition did not improve the result in each case. The imported pure nickels performed fairly well for a time, but became passive in a variable and most exasperating manner without apparent cause. The hot-rolled material was always more passive in the same electrolyte than either of the imported pure nickels or any of the cast anodes, and also varied in its performance. Hammond⁴ and Mathers⁵ report the successful use of International electro-nickel as anodes, particularly after annealing, but the annealing methods are not described. It was found that such material unannealed was even more passive than either the imported pure nickel or hot-rolled; annealing always improved their action, but different methods produced different results. Electro-nickel annealed in an atmosphere of CO dissolved with an efficiency of about 95 per cent and did not turn passive as readily as either pure material, but sufficiently so as to cause pitting. Its use for heavy work was, however, furthermore rendered impractical,

because of the fact that the anodes dissolved irregularly, producing a sort of lace structure which readily crumbled, causing thereby a loss of from $\frac{1}{4}$ to $\frac{1}{2}$ of the anode and making the cathode deposit very rough unless the anodes were held in bags. The domestic so-called cold-rolled malleable nickel performed the best of any nickel tried, particularly with the proper amount of chloride present in the bath. It dissolved with an efficiency of about 97 per cent when free from passive portions. This type of anode was therefore used exclusively in the subsequent three years of this investigation. The average analysis of this material is as follows:

Ni	95.30
Fe	2.13
Cu	0.25
Mn	0.33
C	0.30
Si	0.23

Dr. Langbein⁶ and others report the use of rolled anodes extensively in Europe, and state that their alkali- and acid-forming characteristic is the reverse of that of cast anodes. It is not clear why this should be so, and the statement has been questioned. It was, however, carefully checked and found to be correct, and furthermore the ratio at which a neutrality balance is maintained was found to be very exact. It was found that when the anode is 1.77 times the area of the cathode, the bath will remain relatively neutral for long periods of time. Any increase of anode surface over this turns the bath acid and any decrease turns it alkaline, provided, however, the anode is free from passive portions. Unfortunately, however, such portions were often present, in which case the bath would always turn acid. Sodium sulphonate alizarin was used as an indicator for this purpose. Using these anodes, the general conclusions on electrolytes were as follows:

ADDITION AGENTS IN THE ELECTROLYTE

Nickel-ammonium sulphate is never an advantage over nickel sulphate as a metal carrier. A little alkali metal salt, however, should be present. The addition of conductive salt, as magnesium sulphate, etc., permits of a higher current rate, but the baths are not stable and reliable. The addition of citrates and other organic compounds diminishes the amount of sludge and favors the production of smooth and bright metal, but such baths are exceedingly unstable and the metal produced is always more brittle and cannot be carried to the same thickness as in the same electrolyte without the addition agent.

It has been reported by others that while a nickel electrolyte should be nearly neutral some free hydrogen ions are necessary. This was found to be correct and that boric acid is the best carrier of such hydrogen ions. It is necessary to have some chloride present, but a bath consisting of nickel chloride only would not produce perfect metal even when containing boric acid. It was found that nickel chloride was best and Dr. Watts' bath was finally adopted as standard for most tests. This bath has, however, recently been modified and addition agents introduced.

Warming the electrolyte is an advantage in all cases, but usually little improvement was obtained above 55 deg. C.

With this modified bath, using the cold-rolled nickel

anodes described, many deposits upward of $\frac{1}{4}$ in. (1.6 mm.) could be made in succession, but they were not fully malleable, nor would they stand heating without becoming more brittle, and they often contained pits and other mechanical imperfections.

ELIMINATION OF BRITTLINESS

Other investigators have shown that the embrittlement of electrolytic nickel and perhaps pits are caused by hydrogen. Various means were tried for eliminating hydrogen. It was found that agitating either mechanically or by air resulted in no benefit, but often instead resulted in a much rougher deposit. Various manipulations of the cathode, as shaking and striking, were tried, but without benefit, and it was observed that the hydrogen bubbles would immediately return after removal. Brushing the cathode mechanically was tried, and it was found that while the deposits thus produced possessed a mirror-like smoothness, they were even harder and more brittle than those produced without brushing.

Since one object of this work was the production of armors for electrical heating units, the deposits were made on objects which were supposed to simulate the character of surface which such a heating unit would possess for coating. These objects were glass tubes about $\frac{3}{8}$ in. (9.5 mm.) in diameter and 3 in. (7.5 cm.) long. They were prepared for deposition by the well-known silver-fire process. Several hundreds of these were made and one reason for adhering to their use was the observation that in addition to determining the limits of the thickness by the deposit bursting open, it would often happen that a deposit would build up thick and develop sufficient strain to crush the glass. In this way data could be obtained on those deposits which did not peel or crack open.

The use of these glass tubes as cathodes, however, led to a discovery in a peculiar way. If the deposit cracked open it would nearly always do so along the bottom, and would often occur a considerable time before being observed. In the anxiety to save time and to detect the crack as soon as formed, the cathodes were often jerked out of the bath quickly in order to inspect the bottom of the tube for cracks and then reimmersed. Since it is taught in the art that interruption of current or removal of the cathode will result in laminated deposits, a careful record of these removals was kept and when a large number of cathodes were studied the surprising fact was disclosed that all those which had been subjected to this removal for observation were both much thicker and much more malleable than others, almost regardless of other conditions. A cathode was then made which was removed and re-inserted quickly every few minutes for twenty-four hours. This was found to be by far the most perfect deposit produced.

TIME FACTORS FOR THE PERIODS OF EXPOSURE AND OF DEPOSITION

The time factors were then determined for both the period of exposure and the period of deposition. It was found that, contrary to former beliefs, the cathode removal, if not over fifteen seconds in duration, produced no laminated deposits, but instead, homogeneous and highly ductile deposits. It was also found that the frequency of removal necessary for producing the best results depended upon the factors of deposition influencing the formation of hydrogen, such as anode efficiency, temperature, acidity and current density.

⁶"Electrodeposition of Metals," 7th Ed., p. 273.

⁷Transactions, Amer. Electrochem. Soc. (1916), vol. 29, p. 395.

With the improved bath mentioned above, operating at 55 deg. C., with a current density of 72 amp. per sq.ft. (8 amp. per sq.dm.), it was found that with 97 per cent commercial cast anodes, this necessary frequency of removal or deposition period was thirty seconds to one minute, while with the cold-rolled anodes it was about one to five minutes. An automatic device was then constructed for carrying out this operation, and all of the sample deposits made at the Bureau of Standards and which were exhibited at our last Atlantic City meeting were made by this means.

PHYSICAL PROPERTIES

A physical study of the metal so produced showed that it possessed a far higher degree of ductility than was expected, even exceeding that of any nickel heretofore produced. It was found to have a slightly lower electrical resistivity but a slightly higher density. It was, furthermore, found that the deposited metal could be heated red-hot either before or after rolling without embrittling it. Wires have been drawn from a bar $\frac{1}{8}$ in. (3 mm.) in diameter down to 0.002 in. (0.05 mm.) without annealing. This new nickel, however, develops considerable hardness and increase in tensile strength upon rolling or drawing. The tensile strength of the deposited metal is about 72,000 lb. per sq.m. (50 kg. per sq.mm.), while the wire mentioned above showed a strength of 250,000 lb. per sq.in. (175 kg. per sq.mm.). The Brinell test of the deposited metal is about 130, while that of metal which has been rolled from a plate $\frac{1}{8}$ in. (3 mm.) thick to $\frac{1}{16}$ in. (0.75 mm.) is about 150 Brinell, and it is still malleable. Tests with the Ericsson machine showed a drawing ability better than that of ordinary hard-rolled brass or copper and about equal to dead soft copper.

The average analysis of this new electrolytic nickel is:

Ni	99.70
Fe	0.01
Cu	nil
C	0.02

CAUSES OF PITS

A contemplation of the general utility of a metal of such remarkable properties in the face of certain war demands caused relegation into the background of the original object of producing electric heating or resistance units, and we concentrated instead upon the development of production of sheet metal and of various intricate forms as dies, molds, etc., for industrial purposes. It was soon found, however, that while the metal produced by the means outlined above was highly ductile, it was not always mechanically perfect. The principal trouble was pits of various types, which would appear and disappear in the most exasperating and unaccountable manner. Much has been written concerning the nature and cause of pits in nickel plating, but without any permanent remedy having been found. The last two years of this work were therefore devoted, more or less, to an investigation into the cause and remedy of pits. Many old means were tried for their elimination but without good results.

It was found that small solid particles would cause imperfections, but that the type of pits most troublesome was not so caused. It was also found that excess of air in the electrolyte, which has been shown to be a cause of producing pits in the electrodeposition of lead¹ was not a primary cause, although its presence might

exaggerate the pits if the primary cause were present. The influence of the exact degree of neutrality with relation to solvent acid hydrogen ions was also studied, and it was found that while more hydrogen was generated and a less malleable metal made in an acid bath, this condition is not the primary cause of pits, but will only exaggerate them, if the primary cause is present. The primary cause of pits was finally traced to inherent characteristics of the anode.

PRODUCTION OF PITLESS METAL

The metallurgy and refining of nickel was then studied and several hundred different kinds of anode castings were made. A new anode composition was finally found which, when used with the hydrogen elimination process, produces pitless metal continuously and without diminishing the metal concentration of the bath. It was furthermore found that for reasons which are not altogether clear this anode causes the generation of so small an amount of hydrogen that the necessary frequency of cathode removal is decreased from every five minutes to every two hours.

Many castings have been made which require a removal only every ten or fifteen minutes and will make pitless metal up to $\frac{1}{2}$ in. (0.75 mm.) thick, while a few casts have been made which require removal only every two hours and pitless cathodes have been made with these up to $\frac{1}{8}$ in. (3 mm.) thick. Indications are that the perfection of these anodes will enable the production of pitless metal of any thickness even without the hydrogen elimination process.

It is thought best to defer the disclosure of this anode until it is fully developed and standardized on a commercial basis.

Killing Molds on Lumber by Steaming*

Molds thrive on the surface of wood when it is moist and warm. In a dry kiln molds often develop on the surface of the lumber to such an extent that they seriously obstruct the circulation of air through the pile. This is such a decided hindrance to successful kiln drying that steps must be taken to prevent the mold growth. Various experiments have been made to find a means of accomplishing this result without injury to the lumber.

The safest method found of stopping the growth of mold on lumber in a kiln is to steam the stock at 170 or 180 deg. for a period not exceeding an hour. This treatment heats the surface of the stock sufficiently to kill the mold, and at the same time the saturated air prevents too rapid surface drying, so that the injurious effects which otherwise would be produced on the wood by such high temperatures are avoided.

Unless it is desired to relieve drying stresses at the same time, the interior of the stock should be heated as little as possible. Therefore, the steam supply should be sufficient to reach the desired temperature in twenty-five or thirty minutes. To accomplish this result, plenty of live steam at a pressure of at least 70 lb. gage must be available. The size of supply line and the number and size of perforations that may be required in the steam jet line will vary with local conditions; it is impossible to make them too large or too numerous, as the quicker the steam is supplied the better the effect.

Care should be taken to see that the stock cools in nearly saturated air. Otherwise the surface will dry too rapidly, and casehardening difficulties will set in.

The Control of Chlorine in the Bleaching of Cotton Goods

BY C. M. EDWARD SCHROEDER*

SINCE liquid chlorine became available on the American market in convenient form for handling, the preparation of bleaching liquors of superior quality and uniform composition at once established an improvement which rapidly superseded the more cumbersome and uncertain production of bleach liquors from chloride of lime or bleaching powder. Prior to the introduction of liquid chlorine there had been no material change in the process of cotton bleaching for many years, but the preparation of sodium hypochlorite bleaching liquor, or chemic, with chlorine constituted an improvement of great practical value.

The immediate advantages, aside from cleanliness and ease of handling, derived from using chlorine-soda chemic over the old chloride of lime or bleaching powder solutions are twofold: 1. Chlorine-soda chemic can be made up under constant control of bleaching strength, in clear liquors, ready for immediate use. (Chloride of lime losing strength on exposure and depositing sludge in making up.) 2. There being no lime salts present as in the chloride of lime chemic, goods will not be in danger of tendering or discoloration, and for the same reason goods for dyeing will not show unevenness from lime residues.

During the writer's experience of about ten years past in the handling of liquid chlorine for bleaching purposes, certain improvements and economies have been developed in the matter of control which make this seem a subject worthy of description.

EARLY BATCH MIXING PRACTICE USING CHLORINE

In the earlier experience with preparation of chlorine bleach no attempt was made to control the gas supply by means of special apparatus, but as the gas was obtainable in steel cylinders, holding approximately 100 lb. of chlorine (the filled cylinder weighing about 200 lb.), it was simply necessary to place the cylinder of chlorine on a platform scale and note the amount of gas used up in the preparation of stock chemic.

For further convenience in the daily preparation of large quantities of bleaching liquors, weighing the

chlorine was dispensed with, as it was necessary only to discharge one full cylinder into each tank of soda liquor holding about 800 gal., the cylinders being connected to a $\frac{1}{2}$ -in. lead pipe leading to the bottom of tanks holding the liquor, and the chlorine allowed to enter at full capacity. Of course means had to be employed to overcome reduction of the gas flow due to lowering of temperature caused by such rapid evaporation.

Formerly this was accomplished by placing the cylinders in tubs supplied with warm water, but later the liquid chlorine was allowed to flow from the cylinders placed in a horizontal position, and was conducted through a coiled section of the lead pipe submerged in a tub of warm water, the expanded gas escaping from the end of a lead pipe at bottom of chemic tank. By this means 100-lb. cylinders could be emptied in from one to one and one-half hours.

EXCESS OF ALKALI REQUIRED

It may be observed here that bleach liquors prepared as above described necessarily contain an excess of alkali to insure stability, which in the case of soda ash is not of much consequence excepting as regards cost, but in using an excess of caustic soda there is always danger of deleterious action on the cotton fiber, especially in warm weather, when oxycellulose is likely to form while the material is undergoing the bleaching operation and may cause subsequent tendering and yellowing of the fabrics.

Before the introduction of proper control equipment the procedure was as follows: At first soda ash alone was used to absorb the chlorine, in the proportion of about 3 to 1—that is, taking 300 lb. of soda ash in 800 gal. of water to each 100 lb. of liquid chlorine, yielding a stock chemic with approximately 1.5 per cent available chlorine. This when run in the bleaching machines at 1 to $1\frac{1}{2}$ deg. Tw. furnished a safe and active bleach, although the actual cost of such a bleach was somewhat higher than bleach made of chloride of lime. This cost was later reduced when the chemic tanks were charged with waste caustic soda recovered from mercerizing washings running from 4 to 6 deg. Tw. and enough soda ash added to bring the Twaddell up to about 10 deg.

The excess of soda ash was required to insure stability during the rapid absorption of the gas and while storing the chemic. The bleaching strength was determined on each batch made by titration with N/10 arsenious acid.

PREPARATION OF NEUTRAL CHEMIC

With the installation of Wallace & Tiernan chlorine control equipment the possibility of preparing neutral chemic from caustic soda solutions at once removed the foregoing objections.

There being no need of using an excess of alkali with this method, the cost of soda ash formerly required was entirely eliminated, the waste caustic from mercerizing washings furnishing the necessary supply of alkali. On account of the perfect control of pressure and rate of flow of chlorine, it is possible to utilize caustic liquors of any convenient strength and obtain a sodium hypochlorite of any desired composition and uniformity. That is, by adjusting the chlorine feed valve to supply just enough chlorine to combine with the sodium hydroxide in the caustic liquors, there is

FIG. 1. VIEW OF INSTALLATION

*Consulting Chemical Engineer, Rutherford, N. J.

formed a neutral hypochlorite solution in accordance with the reaction:

and such a bleach liquor is at once ready for use from the moment of starting and as long as the machine is kept running.

FLEXIBILITY OF OPERATION

A valuable feature of this apparatus is its flexibility in operation. For instance, if a bleach liquor is required for storing any length of time a slightly alkaline liquor can be prepared by simply reducing the proportion of chlorine to the caustic content of the absorbing liquor.

Or, if an acid bleach is required, an excess of chlorine is fed in giving a hypochlorite solution according to the following reaction:

thus furnishing a safe means of producing the more rapid hypochlorous acid bleach without the danger of liberating free chlorine as was apt to occur by the old practice of adding acids to bleaching liquors, with attending deleterious effect on the goods.

DESCRIPTION OF BLEACHERY INSTALLATION

A Wallace & Tiernan control equipment which has been under the writer's observation since August, 1920, at the plant of the Standard Bleachery Co.,

FIG. 2. LIQUID CHLORINE EVAPORATORS

Carlton Hill, N. J., was installed to produce 500 gal. of bleach per hour using only waste caustic liquors of about 4 deg. Tw. for absorbing the chlorine and furnishing a steady supply of chemic with from 1.25 to 1.5 per cent available chlorine.

The apparatus consists of a panel upon which is mounted a specially designed injector which effects the combination of the chlorine with the caustic solution. This combination is practically instantaneous, the chemic of full strength and ready for use passing immediately to the stock tank. Indicating meters of the Venturi type are placed in both the chlorine and caustic lines on the panel. The chlorine gas is supplied at the desired rate and under constant pressure from an evaporator that is essentially a steam-heated water bath equipped with thermostat control and pressure-regulating valve.

The control panel was placed in the same room in which were housed three cylindrical brick tanks of about 800-gal. capacity used for making up and stor-

ing chemic, and without changing the existing layout it was possible with this outfit to furnish a supply of bleach equal to the demand formerly met by the three mixing tanks. The accompanying photograph shows how the apparatus was placed. The brick tank shown to the right is the first of the three chemic tanks above referred to, which was put to use as a reservoir for the waste caustic liquor to be fed to the apparatus by means of the centrifugal pump on the floor.

The bleach liquor is discharged into the large rubber hose falling in a loop from the top of the control panel and conducted to either of the other two tanks, from the bottom of which the chemic is drawn to the bleaching machines. One of these tanks is generally kept partly filled to hold in reserve enough stock chemic to meet any fluctuation in draft.

The evaporator outfit, holding four 100-lb. chlorine cylinders, was placed on the ground level directly below the control apparatus.

The only difference in handling the gas supply by this method as compared with the former in use is that four or more cylinders are connected up at once to a manifold allowing the gas to flow through the meter at a maximum rate of 60 lb. per hour for each 500 gal. of caustic liquor, while by the former method the same number of cylinders are connected up separately for each 800-gal. batch made up. That is, by the old method 300 lb. of chlorine would be consumed in making up three tanks, or 2,400 gal. of chemic in one day, while with the Wallace & Tiernan control equipment 3,000 gal. of chemic can be made up in six hours with a maximum consumption of 360 lb. of chlorine.

SAVINGS BY USE OF THE APPARATUS

The saving in cost of soda ash in one week's run with the control equipment as compared with a week during which the same yardage of goods was run by the older method amounted to \$33.

A comparison of six weeks' steady running of the control equipment with a similar period using part soda ash for chlorine absorption showed a total saving of \$219, or \$36.50 per week.

Production of Camphor in Taiwan

The production of camphor during the year ending March 31, 1921, it is anticipated, will exceed that of the preceding year by 275,000 lb., the amount being placed at 6,000,000 lb. Though exports have stopped for the present, the stock of crude camphor on hand does not exceed 750,000 lb., as it is being turned over to Japanese refiners as soon as it is cleaned and pressed at the plant in Taihoku. The monopoly bureau is gradually increasing its rate of production in anticipation of a revival of the celluloid industry in the late summer or early fall of this year, when present stocks of celluloid will have been depleted, the output having been accelerated from 480,000 lb. during the month of July, 1920, to the present monthly rate of 600,000 lb. It is too early to estimate the total output for the twelve months beginning April 1, 1921, as the survey of the camphor forests has not yet been reported upon. No orders from or allotments to the United States, Great Britain or France for the first quarter of 1921 have been reported. The price of camphor for the second quarter has not been announced, but as prices of commodities in general are declining it is supposed that camphor will also be affected.—*Commerce Reports*.

Molybdenum Steel and Its Application*

Beneficial Effect of a Little Molybdenum on the Physical Properties of Complex Alloys, Especially Allowing Safe Use of High Working Temperatures and a Wide Range of Quenching and Annealing Heats

By M. H. SCHMID

Metallurgical Engineer, United Alloy Steel Corporation

WHILE it is true that molybdenum structural steels were commercially developed during the World War, and through their development great advancement in army and navy equipment and accessories were rendered possible, it is equally true that war conditions merely furnished the impetus for this development. The commercial application of molybdenum steels for industrial purposes was inevitable, the assurance of adequate and accessible domestic supply of this important alloying element allaying all fears as to the ability to meet future commercial demands.

That the earliest experiments in molybdenum steels were confined largely to tool and magnet steels is not surprising in view of the fact that molybdenum was not then known to exist in sufficient quantities to warrant its consideration (other than purely academic interest) for commercial structural requirements. It is surprising, however, to note that in spite of the then limited available supply of this alloying element the earlier experimentation on structural steels was in most cases confined to material of a much higher molybdenum content than is considered advisable at the present time. It is also surprising that practically all study was confined to its direct effect in the ternary steels instead of more research on its indirect effect or additive and intensifying effect on other elements in the quaternary and more complex alloy steels. It is of course quite possible that research along the latter lines was pursued but not published. It is a fact, however, that exhaustive research directed by C. H. Wills established the practicability of the commercial application of molybdenum as an alloying element in the various types of alloy steels.

BENEFICIAL EFFECT OF MOLYBDENUM

A review of the many types of steel on which the addition of molybdenum has a distinctly pronounced beneficial effect enables us to grasp the diversity of the application of molybdenum steels. Its effect is pronounced in straight carbon steels, chromium steels, nickel steels, chromium-nickel steels and vanadium steels. In straight carbon or nickel steels, by uniting with the ferrite additional strength is imparted without corresponding decrease in toughness. In steels containing chromium, probably through the formation of double carbides, additional strength and hardness is imparted together with beneficial effect due to any diffusion in the ferrite. The penetrative effect of heat-treatment, especially in large sections, is decidedly pronounced.

I think most of us can recall the time when the selection of alloy steels for various products was based

almost entirely on the physical characteristics obtainable. There are now a variety of types of alloy steels in which there is very little difference in physical properties, all of which will yield the necessary strength and factors of safety in the finished product. The present consumer of alloy steels, having at his command many types that are satisfactory so far as static and dynamic qualities are concerned, is influenced in his choice of material by the efficiency of the product in proper and economical functioning in the various manufacturing processes. From the manufacturing standpoint he wants a steel which first of all has a tendency toward the minimum of inherent defects; he wants a steel which gives the most efficient response to the various thermal and mechanical manipulations to which it is subjected in the numerous stages of processing from the raw material to the finished product.

REQUIREMENTS OF ALLOY STEEL

Careful consideration of the following requirements should be given by the customer in his selection of an alloy steel:

- (1) It shall meet such specifications as are imposed by the engineering department.
- (2) The elements used in its manufacture shall be readily obtainable with assurance of adequate source of supply for the future.
- (3) It shall not be subject to patent litigation.
- (4) It must be entirely practicable as a commercially manufactured product of uniform quality.
- (5) It must respond satisfactorily to various thermal manipulations with reasonably wide temperature ranges.
- (6) It must respond satisfactorily to various mechanical manipulations.

We will now review these requirements in detail from the standpoint of molybdenum steels.

SPECIFICATIONS

There is little need for a detailed discussion regarding physical characteristics. "Molybdenum Commercial Steels," published by the Climax Molybdenum Co., gives concise information as to just what physical properties may be developed on the various types of molybdenum steel. We know that the chromium-nickel-molybdenum steels used on Liberty motors for aircraft service met the most exacting specifications, and records of tests on physical properties showed results superior to those obtained on any other types of steel used in this class of work. As far as the desired physical properties are concerned, it appears but necessary to select the particular type best suited for the purpose under consideration. For general requirements for automotive or machine construction, the chromium-molybdenum steels are usually recommended. For special requirements it

*Paper presented April 22, 1921, before the Washington Chapter of the American Society for Steel Treating.

becomes necessary to use the more complex types, such as chromium-nickel-molybdenum.

RAW MATERIAL

The supply (present and future) of ferromolybdenum for commercial production has been assured. Sufficient ore deposits adequate for many years' production have been established, with the necessary mining and refining capacity to take care of all future requirements. Four-fifths of the world's known available supply of molybdenum is contained within the borders of the United States. The present supply of chromium, the alloy most commonly used in connection with molybdenum, is practically inexhaustible and is found in most every part of the world.

PATENTS

The recent action whereby any alloy steel manufacturer in the United States may be licensed to produce chromium-molybdenum steels under patents during the life of same on a royalty basis which is so trivial as to have no bearing on the price of the steel should relieve any fear as to litigation.

MANUFACTURE

That the manufacture of molybdenum steels is on a practical commercial basis has been well established. The first heat of electric-furnace steel made by the United Alloy Steel Corporation was tapped Dec. 3, 1917, since which time this company has made in excess of 10,000 tons ingots of various types, comprising carbon-molybdenum, chromium-molybdenum, chromium-nickel-molybdenum, etc. The first open-hearth heat of molybdenum steel was tapped by this company May 24, 1918, and since that time approximately 25,000 tons has been produced.

No serious difficulties are experienced in the various stages of processing from melting and casting on through the rolling and cold-drawing operation. The manufacture of molybdenum steel merely requires the same care as is exercised in the production of any well-made type of alloy steel of similar potential properties—in fact, less care than is necessary on many types.

Molybdenum is available as a furnace addition in two forms, as ferromolybdenum and as calcium molybdate. In the ferro form it is most conveniently obtained and used with a molybdenum content of 50 to 60 per cent, although our company has very successfully used 70 to 80 per cent ferromolybdenum. In the form of calcium molybdate we have a lower percentage of metal, averaging 35 per cent. The ferro-alloy may be added in the open-hearth process as follows:

- (1) All additions in the furnace as the charge is melting down.
- (2) All additions in the furnace just prior to tapping (10 to 15 minutes).
- (3) All additions in ladle.
- (4) Part addition in the furnace and part in the ladle.

In the manufacture of molybdenum steels at our plant we have thoroughly investigated all of the above methods and have adopted the first as standard practice because of the better diffusion and higher degree of uniformity in the finished product, together with higher efficiency or minimized loss of the alloy.

It has been our experience that calcium molybdate is most satisfactorily added in sacks as the scrap charge is melting down, being so placed as to permit the partly molten scrap to cover or envelop the salt.

Greater care is necessary with calcium molybdate than with the alloy in ferro form in order to prevent the draft of the furnace from pulling off part of the powdered molybdate addition and carrying it to the furnace walls, ports and checker chambers. The average loss of metal added in ferro form by the first method outlined above should not exceed 5 to 10 per cent, the loss tending toward the minimum where the same furnace or furnaces are used on successive heats, thereby reducing the purely mechanical loss. Just how this loss may be subdivided is worthy of some discussion. A slight mechanical loss is inevitable and we may assume it as running between 2 and 4 per cent, leaving an additional loss of, say, from 3 to 8 per cent unaccounted for. I am not prepared to state just how this should be distributed. It is probably due to both oxidation and volatilization. Molybdenum additions in the ladle are generally inadvisable and where a high molybdenum content in steel is required should be made only in the molten condition.

Of worthy consideration is the utilization of molybdenum steel scrap, which may be included in the furnace charge with a yield of approximately the same ratio as direct alloying additions.

No special comment is necessary regarding ferromolybdenum and calcium molybdate charges in the electric furnace, where slagging, oxidizing and temperature conditions are under absolute control. Practically 100 per cent alloy efficiency is possible.

The blooming and finish rolling operations on molybdenum steel require no special precautions other than those necessary on corresponding types of other alloy steels, and the practice, measured in per cent of available finished product, is higher than in most types of similar properties. The tendency toward a minimum amount of inherent defects, both surface and subsurface, is very pronounced, especially as compared with nickel and chromium-nickel steels.

While molybdenum evidently has no deoxidizing or scavenging effect, it has at the same time no deleterious effects on the working of the steel, and a chromium-molybdenum steel should process as efficiently as the same type without molybdenum, and a chromium-nickel-molybdenum should process as efficiently as that type without this additional alloy. Molybdenum steels as a class may be considered more free from seams than nickel and chromium-nickel steels of corresponding potential values. It would be absurd, however, to claim that such defects in billets heal up or roll out in the finishing mill.

Wide temperature ranges are available for rolling and forging, and while there is no appreciable difference in the amount of scalage, there is a marked advantage in the texture of the scale over that on nickel steels. The scale is a loose, non-tenacious one, freely flaking from the steel, showing no tendency to roll into the surface and result in pitting.

THERMAL MANIPULATIONS

Molybdenum steels as a class may be subjected to unusually wide temperature ranges for both hot-working and heat-treating. This applies particularly with respect to the more generally used chromium-molybdenum types, which will satisfactorily withstand considerably higher temperatures than the corresponding types of nickel and chromium-nickel steels. Forging companies report that chromium-molybdenum steels flow better in the dies than other types, which advantage is probably

due to a large extent to the use of higher working temperatures. I cannot conscientiously credit molybdenum steels with less scalage loss, but it is certainly true that less difficulty is encountered in forging operations on account of the ease with which scale loosens from the bars in carbon-molybdenum and chromium-molybdenum types. Cleaner forgings are obtained and tumbling and pickling charges are minimized.

The outstanding features relative to the heat-treatment of molybdenum steels are the extremely wide quenching ranges available for practical heat-treatment, the excellent penetrative effect of such treatment on large sizes, and the broad drawing range causing but slight modification in physical properties, this due to the retarded disassociation and reversion to normal state upon heat application after quenching. Data have been published by the Crucible Steel Co., the Carbon Steel Co. and the United Alloy Steel Corporation showing uniformity in static properties through a wide range of quenching temperatures, but without information as to comparisons on dynamic properties.

To show that impact as well as static properties evidence no marked variation with quenching temperatures ranging from 1,500 to 2,000 deg. F. inclusive, I have taken average results from a series of recent experiments in our laboratories on chromium-molybdenum steel analyzing as follows: Carbon 0.27, manganese 0.66, sulphur 0.036, phosphorus 0.018, silicon 0.08, chromium 0.83, molybdenum 0.42. The size treated was $\frac{7}{8}$ in. round and all tests were drawn at 1,050 deg. F., after quenching in water at the temperatures indicated.

Quenching Temperature	Elastic Limit	Tensile Strength	Elongation	Reduction of Area	Brinell	Izod
1500	140,000	163,500	18.5	62.7	319	58
1600	139,500	161,700	17.0	63.1	321	62
1700	138,400	160,400	17.5	61.7	321	60
1800	138,300	158,500	18.0	61.5	319	61
1900	139,600	159,600	16.8	57.9	317	56
2000	140,000	157,000	17.0	59.0	317	55

Striking evidence of the penetrative effect of treating as well as the high drawing temperature available for attainment of high physical properties is manifested in our type "LM," chromium-nickel-molybdenum steel, used for crankshafts and connecting rods in aircraft work. The analysis range of this type is carbon 0.22 to 0.30, manganese 0.50 to 0.70, sulphur 0.035 max., phosphorus 0.030 max., silicon 0.10 to 0.20, chromium 0.70 to 0.90, nickel 2.75 to 3.25, molybdenum 0.30 to 0.50. Heats running 0.25 to 0.30 carbon were selected for crankshafts, and those running 0.22 to 0.25 were used for connecting rods. Physical results taken on a full size prolongation (approximately 4 in. diameter) and averaged from twenty-eight tests taken at random showed: Elastic limit, 130,000 lb. per sq.in.; ultimate strength, 142,000 lb. per sq.in.; elongation in 2 in., 20.5 per cent; reduction of area, 65 per cent; Izod, 67; Brinell, 303.

On a series of tests on 2 in. round, taken from the same type, after quenching in oil at 1,450 deg. F. and drawing as indicated we obtain:

Draw	Elastic	Ultimate	Elongation	Reduction	Brinell	Scleroscope
500	233,000	249,800	14.0	46.8	455	54
900	170,000	189,200	16.0	51.6	363	45
1000	161,000	180,700	18.5	58.3	344	43
1100	149,000	166,800	18.5	60.0	328	41

These results show that there is but slight change in physical characteristics between the 900 and 1,100 draws.

On type "MO.102," an oil-hardened gear steel, we obtain a tensile strength in excess of 200,000 lb. per sq.in. for all drawing temperatures up to 1,000 deg. F. and an elastic limit in excess of 200,000 for all tem-

peratures up to 900. Tests on standard 0.505-in. specimens, quenched in oil at 1,450 and drawn at 400 and 1,000 deg. F. respectively, give:

Draw	Elastic	Tensile	Elongation	Reduction
400	302,000	336,600	10.0	22.4
1000	190,000	202,200	15.5	50.1

MECHANICAL MANIPULATIONS

The most important mechanical operations to which steel is subjected in the manufacture of the finished product are cold-pressing, forming and heading, and machining. Efficient response in the operations involving cold flowing of metal effects savings in fabricating costs resultant from minimization of rejections in semi-finished and finished parts, as well as maintenance costs on dies and tools. The merits of molybdenum steel for this purpose have been established through the results obtained on carbon-molybdenum and chromium-molybdenum types in the cold-forming and pressing operations in the manufacture of automobile frames, steel wheels and rear axle housings; through production of cold-headed parts on the chromium-molybdenum types, and through cold upset balls on the high-carbon, chromium-molybdenum ball and race types.

The molybdenum steels have better machinability than other alloy steels of equal physical properties. This has been established by the production results obtained on several thousand tons processed into rear axle drive shafts and on which no machining difficulties were experienced on shafts heat-treated to conform to a 300 to 340 Brinell specification. On a heat made by the United Alloy Steel Corporation for one of the large automobile companies and put into steering knuckles and front axles, we received a report to the effect that tool-grinding costs were but one-third as high as on $3\frac{1}{2}$ per cent nickel steel of the same hardness and with corresponding shop production. Front axles with Brinells up to 340 maximum machined as well as chromium-nickel steel axles of 302 Brinell.

The scope of application of molybdenum steels appears wider than that of any of the other types of alloy steels. While the greater portion of the molybdenum steel manufactured to date has been used in automotive forgings and pressed metal parts, its excellent properties have likewise warranted its use in a variety of other parts, embracing railroad forgings and track bolts, armor plate, air flasks, agricultural implements, shovels, machinery forgings and piston rods, various edge tools, etc.

The general utility of molybdenum steels promises an increased demand in a well-diversified field.

Explosives in 1920

The total production (excluding exports) of explosives in the United States during the year 1920, according to reports that the U. S. Bureau of Mines has received from manufacturers, was 537,954,750 lb., an increase of 120,320,280 lb., or 29 per cent over the total output in 1919.

The production for 1920 is segregated as follows: Black blasting powder, 254,879,825 lb.; "high" explosives other than permissible explosives, 229,112,084 lb.; and permissible explosives, 53,962,841 lb. As compared with 1919, these figures represent an increase of 41 per cent for black powder, 15 per cent for high explosives and 39 per cent for permissible explosives.

The reports show that all classes of consumers used larger quantities of explosives in 1920 than in 1919, the principal increase being in coal mining.

Legal Notes

BY WELLINGTON GUSTIN

Principles of Shipping and Delivery of Goods Enunciated by Court Decision

The misdelivery of goods by the seller to a carrier other than the one named by the buyer completely exonerates the buyer from liability for loss of the goods, holds the Supreme Judicial Court of Massachusetts in a recent decision in an action brought by St. John Bros. Co. against Falkson, 130 N. E., 51. The decision involves some simple but important principles of shipping and delivery of goods.

The suit was one on contract to recover the price of a shipment alleged to have been sold and delivered by the company to defendant. It appears that the company received an order for the products at a stated price, "terms net ten days, to be shipped by freight via Metropolitan Line," that it be properly packed, addressed and made shipment to the buyer by the New England Steamship Co., but that delivery of same was never made to the buyer.

The company argued that on all the evidence it should have had a verdict, although the shipment was not made by the carrier designated by the defendant and although the goods were lost in transit. The defense was on the ground of the misdelivery to a carrier other than the one named by the buyer. The court said if there was nothing more the buyer would not be liable. And the company contended that the buyer had waived the right to stand on its defense of misdelivery.

The facts for this contention were that after the shipment of the products considerable correspondence passed between the parties; that in none of the letters written by the buyer did he make complaint or even refer to the fact that delivery had been made to the wrong carrier; that the buyer had received the bill of lading without protest as to the carrier named therein; that said buyer had made claim and brought action at law against the New York, New Haven & Hartford R.R., on two counts, one in contract for failure to deliver the goods, and the other for negligence in transportation, in each count the buyer herein describing himself as the consignee of the goods delivered to the carrier by the company, and which action is still pending. These facts were said to show a waiver as matter of law, but the court said that when more than one rational inference can be drawn from the evidence, a question of fact is presented, and the result is not a pure question of law.

WAIVER DEFINED

The court says: "Waiver is the voluntary relinquishment of a known right. It may be established either by words or conduct or both. It may be found to flow from all the circumstances as well as by express revelation of purpose." Whether there has been a waiver is usually a question of fact. Omission in his letters to the shipper to refer to the shipment by another carrier than the one named by him is not decisive. He was persistent throughout the correspondence in his denial of liability and in his refusal to pay.

Delivery of a non-negotiable bill of lading to the buyer of goods by the seller thereof, who shipped by an

unsanctioned carrier, and its retention by the buyer are not conclusive on the issue of waiver of his rights arising from the misdelivery, says the court. Possession of such bill of lading is of little significance as to title, for the carrier rightly could deliver to the consignee and discharge its liability without surrender of such a bill.

Further, the naming of the buyer of goods as consignee in a bill of lading, taken by the seller from a carrier not designated by the buyer, was some evidence that he was owner, but was not absolute proof; and an action at law, never brought to trial by the buyer, was not an unequivocal assertion of waiver of his right to rely on the seller's failure to perform its contract with him as to the selection by the carrier. This action may have been regarded as an attempt of the buyer to help the seller in tracing the goods or as founded on some other ambiguous design.

The effect of all these circumstances, the court rules, was not decisive to the effect that there was a waiver by the buyer of his right to defend on the ground of misdelivery. Whether there was a waiver was for the jury to decide.

Judgment for the buyer was upheld.

What Constitutes a Contract by Letters and Telegrams

A large volume of business is done by means of letters and telegrams, there being nothing else to express the contract between the parties. What is an offer and such acceptance to make a contract by means of such correspondence is not always clearly understood. In all cases there must be a complete meeting of the minds of the parties thereto on the subject matter of the negotiations, which means there must be an offer on the one side and a complete acceptance of that offer, without change or modification, to constitute a binding contract. To accept conditionally is not an acceptance, but a counterproposal or offer to the original offerer, which he in turn may accept or reject.

A recent decision of the Supreme Court of Arkansas relates to a contract for the sale of cottonseed oil in which letters and telegrams were used to confirm oral negotiations. The oil company sued to recover damages for defendants' refusal to deliver to it 100 tons of cotton seed which it had purchased from him. The agent of oil company claimed he had a conversation with the defendant and had purchased the cotton seed at \$37 per ton. Defendant claimed he should be allowed to draw draft for the full amount, but the agent said no, the balance would be paid when cars came with full weight. The agent then asked the defendant to confirm the sale by a telegram, which was sent as follows:

"I confirm sale of 100 tons cotton seed immediate shipment at 37 f.o.b. Conway."

The oil company replied by telegram stating it was mailing written instructions. The letter was confirmatory of the telegrams and the instructions authorized the seller "to draw for 90 per cent of the value of each car, with bill of lading and invoice attached to your drafts with the understanding you will guarantee shipping weight."

The defendant immediately wrote that he could not sign the confirmation of purchase sent him, for the reason that it contained a contract essentially different from the one he had offered to enter into. He stated that the contract agreed upon was that he should draw on the purchaser with bill of lading attached for the

full amount of the invoices, and that he should only guarantee the weights to be within one-half of one per cent of the weights shown by the invoices.

AGREEMENT MUST BE MUTUAL IN EVERY ESSENTIAL

Passing on the case, the Supreme Court said that a binding contract of sale may be entered into by letters and telegrams, and that an acceptance by letter or telegram of an unconditional offer, made in the same manner, will constitute an obligatory contract. It is equally well settled that before the contract is consummated each party must agree to the same proposition, and the agreement must be mutual to every essential term of the contract.

The oil company in its telegram of acceptance of the sale referred to its letter and the shipping instructions as a part of its acceptance of the offer made by the seller in his telegram. Hence they constituted a part of the negotiations, and it cannot be said that the two telegrams alone constituted a binding contract between the parties, said the court.

The limitation of the right of the seller to draw for only 90 per cent of the invoice price of the cotton seed and requiring him to guarantee the weights and quality at destination were different from those contained in the seller's telegram. The new terms as indicated in the letters prevented the telegram of the oil company from being an unconditional acceptance of the offer. The seller rejected the proposal contained in these letters as soon as he received them. Hence there was no meeting of the minds of the parties on the same terms.

Metal Protective Paints*

BY HENRY A. GARDNER†

THE causes underlying the corrosion of steel and the principles to be adopted in designing protective paints are well understood as the result of comparatively recent work.¹ In fact, the manufacture of the majority of high-grade paints now produced is based upon these principles. Briefly stated, they are as follows:

1. Basic substances in sufficient concentration inhibit the corrosion of iron. Basic pigments that are effective for this purpose are litharge, red lead, blue lead (basic lead sulphate), white lead, zinc oxide.

2. Chromic compounds (soluble bichromates), even in great dilution, prevent the corrosion of iron. Chromate pigments that are similarly effective when used in sufficient amounts are as follows: Basic lead chromate, normal lead chromate, zinc chromate.

3. Neutral substances that do not ionize to acid reaction are considered inert. So-called neutral or inert pigments, such as iron oxide, which do not excite corrosion, produce with linseed oil very durable films. Such pigments include black, brown and red oxides of iron, china clay, silica, talc, and barium sulphate.

4. Substances that form a galvanic couple with steel in the presence of moisture cause rapid corrosion. Pigments which act in this fashion (graphite, carbon black, lampblack) are used only as constituents of the finishing coats on steel surfaces, when first insulated from

the metal by a coat of basic or chromate pigment paint. These carbon pigments with linseed oil form very durable and water-resisting coatings.

PRIMER PAINTS

From the above data it is apparent that paints for priming steel should preferably be made of a substantial amount of one or more basic or chromate pigments, and that these paints should be covered with water-resisting finishing coats of carbon or iron oxide paints. For instance, steel that has been primed with high-grade red-lead paint and finished with two coats of a carbon paint will be protected from corrosion under most conditions for a long period of time.

In many instances, high-grade proprietary primer paints contain a mixture of red lead, chromate pigments, iron oxide and zinc oxide.

FINISHING PAINTS

The finishing coats of such paints contain carbon black or lampblack, generally with 5 per cent of litharge, and often certain amounts of iron oxide and silica. The liquid for such paints is raw or boiled linseed oil with a total of about 15 per cent of liquid drier, turpentine or mineral spirits. Where high gloss is desired, the addition of spar varnish is indicated.

In many places the use of black or other dark colored finishing paints may be objectionable from an æsthetic standpoint or because of their gloomy appearance. Light-gray paint made of white lead and zinc oxide, or of zinc oxide and barium sulphate (navy practice), tinted with lampblack, have been used as finishing coats on steel bridges, government structures and vessels. While possibly not as durable as red or black paints, they give much higher light-reflecting values and are of more pleasing appearance. For use around acid and chlorine factories, black bituminous coatings have usually been adopted. Of recent years, however, there has come a demand for white and light-colored paints. The only white opaque pigment for such paints that is insoluble in most acid gases is titanium oxide. This pigment, which is now produced by an electrochemical process and contains 25 per cent of titanium oxide precipitated on 75 per cent of barium sulphate, possesses tremendous hiding power. It is usually applied with up to 40 per cent of zinc oxide to give it sufficient hardness. In white or tints, such mixtures are very durable.

Various metal powders are now being applied to some extent as constituents of metal protective paints. When applied direct to steel surfaces, zinc powder and aluminum powder have much greater rust-preventing properties than the powders of other metals, on account of the high electro-positive nature of zinc and aluminum. Because of the great light-reflecting properties of aluminum powder, its use is indicated for special purposes on exterior work. Probably the most satisfactory liquid for suspending this powder is a high-grade exterior spar varnish. When used with linseed oil, a rather slow drying paint results.

CONCLUSION

Standard painting practice for iron and steel calls for the application of a primer containing basic or chromate pigments. Finishing coats generally contain red oxide or black carbon pigments. A wider use of white and light-tinted paints of high light-reflecting power is indicated for many purposes as finishing coats.

The Nature of Zinc Dust*

Complete Chemical Analysis of Zinc Dust From Retorts and Electric Furnaces—Five Hexagonal Crystals of Zinc Oxide Found—Briquetting Tests—Good Recovery of Metallic Zinc by Melting Under Salt Mixtures Containing Zinc Chloride

BY OYSTEIN RAVNER

AN additional study on the operation of electric distilling furnaces, supplementary to those on the Condensation of Zinc Vapor, appearing in *CHEMICAL & METALLURGICAL ENGINEERING*, Vol. 24, p. 885, May 18, 1921, some zinc dust from a smelter using electrothermic processes was secured, both from the ore furnaces and refining or redistillation furnaces. Analyses were as shown in Table I.

TABLE I. ANALYSES OF ZINC DUST

	From Spelter Furnaces, Per Cent	From Zinc Redistilla- tion, Per Cent	Methods of Analyses
Zn.....	40.10	76.61	Total Zn was determined by precipitation as ZnS, which was dissolved and electrolyzed (Treadwell).
ZnO....	48.48	20.10	By determining the reducing action of the dust on a standardized potassium bichromate solution (Frankel). See Nissenson "Die Untersuchungs metodes Zinks."
Pb.....	6.15	0.17	Electrolytically as PbO.
Fe.....	0.58	0.05	After precipitation with NH ₃ the precipitate was dissolved and titrated with N/20 KMnO ₄ sol.
Cd.....	0.09	0.07	Determined as sulphate according to H. Nissenson, <i>Chem. Zeit.</i> 1906, p. 16.
As.....	0.05	0.01	The dust was dissolved in HCl, KClO ₃ added to avoid AsH ₃ and As determined by means of KBrO ₃ sol., according to A. Ledebur, "Leitfaden für Eisenhütten Laboratorien."
S.....	0.94	0.00	Determined as BaSO ₄ after fusion with soda and saltpeter.
Sb.....	traces	traces	
Insoluble and C..	3.28	2.32	Spelter dust contained 0.10 per cent C and the zinc dust 0.22 per cent C. Determined as CO ₂ by wet combustion with CrO ₃ (Treadwell).
Nitride..	0.34	0.33	
Water...	0.37	0.24	
Total..	100.38	99.90	

As a comparison, typical analyses from the smelter are given below:

	From Spelter Furnaces			From Zinc Redistillation		
Zn, per cent	39.30	35.05	36.38	71.25	75.39	81.20
ZnO, per cent	48.50	55.30	48.30	25.09	20.09	12.86
Pb, per cent	9.45	7.60	6.50	0.12	0.15	0.09

When these results are compared with analyses of zinc dust from retort furnaces, a great difference will be found.

The following analyses in Table II are taken from R. G. Max Liebig's "Zink und Cadmium" and from W. R. Ingalls' "The Metallurgy of Zinc and Cadmium."

OXIDE AND SULPHUR IN ELECTRIC FURNACE DUST

The great amount of sulphur and oxide in spelter dust from electric furnaces is remarkable. The sulphur was present principally as sulphide. However, there were traces of SO₂ radicle.

These facts may be explained as follows: The process

at the electrothermic smelters is continuous, while at the old smelters, using externally heated retorts, the process is intermittent. Moreover, the electric furnaces have a much greater capacity than the others. They require therefore much larger condensers, and the time

TABLE II.

	Typical Analyses of Zinc Dust From Retort Furnaces			Zinc Dust of Commerce

between distillation and deposition will consequently be much longer. The longer this time is the more carbon dioxide will be formed, according to the reaction:

and the carbon dioxide will form oxide with the zinc vapor. Cooling of the vapor should therefore proceed as quickly as possible.

The great amount of sulphur in the dust is due to the fact that the electric furnaces do not always use ore as low in sulphur as the old processes do. The following reactions take place at distillation temperatures.

At the high temperature employed, however, a little zinc sulphide may volatilize.

PHYSICAL PROPERTIES OF ZINC DUST

Dust from spelter furnaces was a powder of light gray color. Examination under a binocular microscope showed it to consist principally of a gray, homogeneous powder, among which small metal globules could be seen.

Dust from the redistillation furnace was a black powder with large and small globules of a metallic luster. By examination under the binocular microscope it was seen to consist chiefly of metallic globules of various sizes, together with a black powder, probably carbon from the electrodes. Some of the metallic globules were covered with a gray powder; others had a violet color.

Samples weighing 100 g. were taken and screen sized. As the grains in the powder were spherical, the diameter is given as representing the grain size, in Table III.

Particularly parts having a grain size between 0.6 and 0.13 mm. contained clear white crystals, which were picked out and examined. In one sample twelve

TABLE III. SIZING TEST OF ELECTRIC FURNACE DUST

Grain Size	Spelter Dust, per Cent	Zinc Furnace Dust, per Cent
1—Grains over 1 mm.	40.0	26.4
2—+1-0.6 mm.	9.2	12.3
3—+0.6-0.3 mm.	5.7	10.8
4—+0.3-0.13 mm.	13.3	19.7
5—+0.13-0.09 mm.	6.2	7.7
6—less than 0.09 mm.	25.4	23.0
Loss	0.2	0.1
Total	100.0	100.0

particles were found. They were boiled for some time in concentrated hydrochloric acid, when four of the grains disappeared, while the remainder did not seem to be affected. The acid then showed the presence of zinc only. The insoluble residue from the hydrochloric acid solution was fused with soda, and tested qualitatively; SiO_2 , Al and Zn were found to be present.

In order to determine the composition quantitatively, as many crystals as possible were picked out, boiled in concentrated hydrochloric acid, washed and dried. Analysis then gave the following result: SiO_2 , 61.75 per cent; Al_2O_3 , 11.52 per cent; ZnO , 27.42 per cent.

Some of the grains were entirely transparent, others were not. Whether only one kind of crystals were present, or if there was a mixture of, for instance, zinc spinel, ZnAl_2O_4 , and quartz, could not be determined, as the crystals were small and incomplete and, moreover, occurred in such small quantities.

It seems peculiar that these crystals were found principally in the spelter dust and that they occurred only in sizes under 0.6 mm. This may be explained on the assumption that these particles were pulled from the charge during distillation. A much more violent generation of gas occurs in the spelter furnace, where ore and coke are charged, than in the refining furnace, where only zinc is distilled. It would therefore seem but natural that these crystals have their origin in the furnace lining, especially since they are found in small quantities in the dust from the redistillation furnaces.

In order to examine the crystals which were insoluble in hydrochloric acid more closely, some crystals from the lining of a zinc furnace were obtained. Some of these were found to be completely insoluble in concentrated hydrochloric acid, and the analyses proved them to consist of pure zinc oxide. According to determinations by Prof. J. Vogt, the crystals were hexagonal. ZnO occurring in nature has the same crystalline form.

SPECIFIC GRAVITY

In order to determine the specific gravity, the same apparatus as employed for determining the specific gravity of cement was used. The liquid used was turpentine and the increase in volume corresponding to a weighed amount of dust was read on a graduated neck. Dust from the spelter furnace weighed 5.81 g. per c.c., while dust from refined zinc weighed 6.10 g. per c.c.

BRIQUETTING EXPERIMENTS

An apparatus was used for these tests on which the corresponding volume was read directly for every pressure applied. The zinc dust was introduced into a hollow cylinder 8.8 cm. high of the best grade of axle steel, with a tight fitting piston of the best grade of tool steel. As the cross-section remains the same, the volume will be proportional to the height of the cylinder of zinc dust. Fig. 1 shows the compressibility graphically.

It was very difficult to get the briquets out of the

cylinder, as they adhered very strongly to it. The maximum pressure used was 1,500 kg. per sq.cm. This pressure compressed the dust from the redistillation furnace to 54.55 per cent of the original volume. When the pressure was released, the briquet expanded 0.2 mm., so that the final volume became 54.77 per cent of the original volume. The briquet had but little strength, and fell to pieces when taken out.

The maximum pressure of 1,500 kg. per sq.cm. corresponded to a volume of 51.14 per cent of the original volume of the dust from the spelter furnace. When the

FIG. 1. VOLUME OF ZINC DUST BRIQUETS AFTER VARIOUS PRESSURES

pressure ceased, this briquet also expanded 0.2 mm., so that the final volume became 51.36 per cent of the original volume.

This briquet had more strength than the briquet of refined zinc dust. It weighed 4.35 g. per c.c.

As the specific gravity of the dust was 5.81 g. per c.c., the empty space per c.c. is:

$$p = 1 - \frac{4.35}{5.81} = 0.25$$

or a porosity of the briquet is still 25 per cent. It can probably be compressed considerably more by means of a sufficiently high pressure.

The dust was treated with oil before briquetting, but the strength was not improved thereby. However, briquets which contained a little tar or bituminous matter were considerably stronger.

CHEMICAL PROPERTIES

On account of its finely divided form, zinc dust is a powerful reagent. The use of zinc dust to effect reduc-

ing actions in organic chemistry is well known. Other less known reactions follow.

A mixture of one part zinc dust and two parts sulphur flowers burned like gunpowder when ignited. White fumes of zinc sulphide were given off, which compound was volatile at the temperature of this reaction.

A mixture of dry zinc dust and iodine reacted violently when moistened with a drop of water.

Zinc dust has also pyrophoric properties. If it is heated in the air, it will ignite, and burns to oxide before it melts.

In order to melt together the metallic grains, the dust from the refining furnace which contained 76.61 per cent metallic zinc was heated in various molten salts or salt mixtures to exclude the air, in an attempt to cause the zinc to run together in the bottom, so that when this process was practiced on a large scale it would be possible to tap out the molten metal.

Forty grams KHSO_4 was melted and 20 g. dust added to the fused mass and stirred in to make it sink. A perceptible generation of SO_2 took place while the heating was continued, and after 10 minutes the melt was poured into an iron button mold. The zinc dust had collected at the bottom, but the zinc had not run together.

The SO_2 generation may be due to the reactions:

and this, when heated, will give:

The zinc will therefore be gradually oxidized.

An attempt was then made to melt the zinc by keeping the dust in a molten mixture of NaCl and Na_2CO_3 , but the dust remained as such in the bottom. A mixture of NaCl and CaCl_2 gave the same result.

A melt, however, of 50 g. ZnCl_2 + 50 g. NaCl , to which 50 g. zinc dust was added, gave a zinc button which after having been washed in hot water and dried weighed 31.2 g. As the zinc dust holds 76.61 per cent metallic zinc, the recovery was 81.44 per cent. To the melt from the preceding test, 5 g. zinc dust was again added, and 33.5 g. zinc was obtained, giving a recovery of 87.71 per cent.

A melt of 50 g. CaCl_2 and 50 g. ZnCl_2 with 50 g. zinc dust added gave a zinc button which weighed 35.1 g., or a recovery of 91.62 per cent.

According to these tests, it seems that ZnCl_2 should be present in order to melt the zinc. This may be explained by saying that ZnCl_2 dissolves zinc oxide, thus freeing the metallic zinc and enabling it to coalesce. Further confirmation of this idea may be found in the fact that the recovery, when treating dust from the spelter furnace which contained more oxide, was not even approximately as high if the amount of zinc chloride in the melt was not increased proportionately.

Organization of Workers in Germany*

IN GERMANY, as in all countries affected by the war, the power of labor and especially of organized labor has increased considerably. In order to secure an uninterrupted supply of war materials concessions without end had to be made to the working classes. The greatly augmented power of the working classes which was acquired during the war underwent an even more extraordinary increase during two years following the armistice. The most distinguished feature of this vastly increased power of labor is to be found in the development of the trade unions, particularly of the so-called "free" trade unions.

The most important groups of the German trade unions are the "Free," the Christian, the Hirsch-Ducker, the Syndicalist and Communist, and the so-called "Yellow Unions." The development of the German trade union movement has repeatedly been discussed in publications of the Bureau of Labor Statistics. For this reason and owing to lack of space only a very sketchy description of the development of the individual trade union groups is given below.

THE "FREE" TRADE UNIONS

The "free" or Social Democratic trade unions (*Freie Gewerkschaften*) embrace the great majority of the organized workers in Germany, and constitute the most highly organized labor organization in the world. At present the number of members is over 7,000,000. The movement was started in the '60s of the last century, mainly by members of the Social Democratic Party. By 1874 the early unions, which were viewed with dis-

favor by the government, had died out. Attempts were made to revive them, but the anti-socialist law of 1879 destroyed not only socialist bodies but also practically all trade union organizations. Between 1878 and 1888, 108 trade unions were dissolved by the authorities; but in spite of that, many unions contrived to keep alive under the form of mutual benefit societies, so that, when the anti-socialist law lapsed (it was never repealed), a large number of unions were in existence in a more independent form than before, though the members were still pledged to work for the Social Democratic Party.¹

In 1890 it was decided to link up the unions in a central organization, and at a conference in Berlin the General Commission of German Trade Unions was founded. This conference also decided on the form that trade union organization should take, that the real power should be left with the national federations, which still remain the strongest and most characteristic element in German trade union organization. Until the tenth congress in July, 1919, the central co-ordinating agency was the General Commission, with its headquarters in Berlin. It consisted of a committee of thirteen members, elected by delegates of the trade federations, meeting every three years at a trade union congress. Its functions were to carry on general trade union propaganda and publish trade union statistics. It also issued the *Korrespondenzblatt*, the weekly organ of the Social Democratic unions.

In 1913 there were 2,548,763 members of the "free" trade unions in forty-seven organizations. Each of the unions had its own journal. The local branches and district organizations are very closely supervised by the national executives of the unions. The local branches of the unions are federated in "cartels" (*kartelle*) which correspond more to the British trade councils and the

*From *Monthly Labor Review*, vol. 12, No. 3, March, 1921, p. 131.

See "Organization of Employers in Germany," *CHEM. & MET. ENG.*, vol. 24, No. 20, p. 889.

¹*Labor Overseas*, vol. 1, No. 1, p. 116; London, 1920.

American central labor unions than to the French bourses du travail or the Italian chambers of labor. They do, however, manage strikes in their own districts. The secretary of the cartel is very often in charge also of the local labor secretariat (*Arbeitersekretariat*).

At the tenth trade union congress at Nuremberg in July, 1919, a complete reorganization took place. The General Commission was abolished, and the General Federation of German Trade Unions (*Allgemeiner Deutscher Gewerkschaftsbund*) was constituted. Its aim is to "form a permanent means of co-operation between the affiliated unions in representing the common interests of all workers organized in trade unions." The federation has an executive committee consisting of fifteen members elected by, and responsible to, the congress. The former council is replaced by the federation committee which consists of one member of the executive committee of each of the central unions (generally the president). The cartels are now known as local committees.

ACTIVITIES OF THE FREE TRADE UNIONS

When the war broke out the unions made a truce (*Burgfriede*) with the employers, and their services were entirely at the disposal of the government. They co-operated with the employers in joint councils (*Arbeitsgemeinschaften*) and greatly extended the system of collective agreements. At the revolution they took no part in political action. Friction soon developed between them and the workers' councils (*Arbeiterräte*) owing to attempts to exclude the unions from influence in the councils.

The split in the Social Democratic party naturally brought about a division in the unions. The trade union congress in July, 1919, declared its political neutrality owing to this division. At this congress the "patriotic" attitude of the General Commission was sharply criticized, but a vote of confidence was ultimately passed. There is a strong revolutionary minority in the federation which has captured the powerful Metal Workers' Union and the Berlin Trade Union Commission. This minority is opposed to all negotiation with employers, and the joint council in the metal trades has been dissolved. The majority is in favor of a wide extension of joint councils in preparation for "the social state." The majority leaders maintain that works councils, if they are to be successful, must not be more than the organs of the unions within the various establishments, while the minority hold that they must be revolutionary agencies.

The most interesting event in recent trade union history was their entrance into the political field at the time of the Kapp coup in March, 1920. The unions organized a general strike against the usurping junker government, with the co-operation of both the majority and the independent socialists and with the approval of the public; their action was the chief cause of Dr. Kapp's failure. The federation declared that the struggle would be continued until the government granted a list of demands which included trade union "influence" over the reorganization of the government, social and economic legislation and the resignation of Herr Noske, Minister of Defense. Although the concessions made by the government were not wholly satisfactory to the unions, it is significant that such demands were made. Before the war, the unions, while closely connected with the Social Democratic party and believing in the class war, had held that all such questions should be left to

the political party, and that the immediate business of the unions was to work for improvement in the position of the workers, mainly by means of better wages and working conditions. They were active in encouraging international co-operation, and in pre-war times the great majority of the international trade union federations had their headquarters in Germany.

THE CHRISTIAN UNIONS

The religious trade union movement was first co-ordinated about 1890 in opposition to the socialism and militant methods of the "free" unions. There are three branches, the Christian, the Catholic and the Evangelical. They are strongest in the industrial and mining districts of Rhenish Westphalia, where the Catholic Church is very influential, and in Bavaria. In 1899 a Federation of Christian Trade Unions of Germany was formed to admit members of any Christian denomination. Its aims were stated to be to promote the common interests of employers and workers and to increase production. Its methods were to be conciliatory, the strike to be admitted only as a last resource. Occasionally they have co-operated with the "free" unions for common, strictly economic ends.

In 1919 a federation was formed called the German Trade Union Federation composed of the "Christian" unions, the Trade Union of Non-Manual Workers and the Union of German Officials. The membership was stated to be 1,700,000 at the end of 1919. The unions forming the new body were stated to be inspired by the conviction that not class warfare and internationalism but national consciousness and the fostering of the ideals of the German people were the right path for the future.

HIRSCH-DUNCKER UNIONS

The Hirsch-Duncker unions date from about 1868 and were due mainly to the efforts of Dr. Marx Hirsch, who drew his inspiration from the English trade unions of that period. They were meant partly to counteract the influence of the Social Democratic unions which were then springing up. They were originally political and economic associations of workingmen more or less in sympathy with the radicalism of their founder. At their congress in 1906 they declared themselves to be "neutral organizations for economic ends." They believe that the interests of employers and workers are fundamentally the same and that concessions must be obtained by agreement and not by aggressive methods, and without political action. At their congress in 1908 their aims were defined as the repudiation of class warfare and community of property, support of arbitration and conciliation in preference to strikes, and the establishment of collective agreements. At the end of 1919 they had only 188,831 members and, though this number has probably grown with the general spread of trade unionism, they have no great significance in the German labor movement.

SYNDICALIST AND COMMUNIST UNIONS

Syndicalism in Germany is organized in the associations centralized in the Free Workers' Union of Germany. They are described in the journal of the Metal Workers' Union (itself extreme), as "extremist organizations whose principles are those of class war." They are strongly opposed to social democracy. Before the war they were known first as the Federation of Syndicalists and later as the Free Association of German

Trade Unions. Since then the name has been changed several times, the name Free Workers' Union of Germany (*Freie Arbeiter-Union Deutschlands*) being adopted at the congress in December, 1919, as many workers in Germany are shy of the name of syndicalism. In some districts they are known as "localists." The writer in the *Metal Workers' Journal* states that numerically they are not strong; they had 15,000 members before the war and 110,000 at the end of 1919. A delegate at the 1919 congress said that progress had been rapid in the Ruhr district, where 90 per cent of the miners were organized in syndicalist organizations.

As the contributions exacted by the union are very low, it is unable to finance strikes successfully and prefers to adopt "ca'canny" methods and passive resistance, in order to reduce output to such an extent that the employer may be compelled to shut down his factory. The state, it is believed, would then have to hand over the establishment to the workers.

The General Workers' Union (*Allgemeine Arbeiter-Union*) is a communist organization and is the outcome of the dissatisfaction felt by the workers with the "reactionary and bourgeois" tendencies shown by some trade union leaders. Opposition to trade unions was strengthened by rumors that the Russian Communists were unfriendly to the unions and that there was no room for the latter in a soviet republic. It was asserted that there should be only one proletarian organization, whose aim should be the conquest of political power.

The Communist party refused to support these ideas, but, when the Communist Labor party was formed at Berlin in April, 1920, it refused to recognize the trade unions, because they were willing to co-operate and make compromises with capitalism.

AIMS OF SYNDICALIST AND COMMUNIST UNIONS

The most prominent feature of the bylaws of the General Workers' Union is the antipathy shown toward the Social Democratic trade unions. The union is organized on the basis of works organizations. Workers in one establishment form a "union" under the leadership of the works council. This union works in close co-operation with the Communist Labor party. Its aims are (1) to destroy the trade unions, and (2) to prepare for the communist system.

Thus the syndicalist free union and the communist general union differ widely, the former aiming primarily at industrial conquest and the latter at political supremacy. They are at one, however, in attacking official trade unionism as bureaucratic. In their opinion leaders are unnecessary, and their own spokesmen have no position of authority and no responsibility. The free union attacks all forms of centralization, and accuses even the general union of a tendency toward centralization through its co-operation with the Communist Labor party.

"YELLOW" UNIONS

The so-called "yellow" workers' movement in Germany was promoted before the war by large firms, such as Krupp's and Siemens'. The total membership before the war was 280,000. During the war their membership decreased and in a national agreement between the largest employers' organizations and all of the large workers' central organizations, concluded on Nov. 15, 1918, it was expressly stipulated that employers must sever all connection with the movement. In an article in *Freiheit* (Berlin, July 2, 1920), Herr Aufhäuser,

president of the Federation of Social Democratic Unions of Technical and Office Employees and a member of the National Economic Council, states that the "yellow" movement is being revived. The new organizations are the National Federation of German Trade Unions (*Nationalverband Deutscher Gewerkschaften*) and the National Federation of Technical Employees (*Nationaler Bund Technischer Angestellten*). They are stated to be subject to the influence of Herr Karl Friedrich von Siemens (president of the Siemens Co. and one of the leaders of the Democratic party). The actual leader of the movement is Herr Geisler, a Reichstag Deputy of the People's party. The above unions are organized in industrial groups with the avowed object (as stated in Herr Geisler's journal the *Deutsche Arbeitgeberzeitung*) of "obtaining the strongest possible representation in the works councils and of making the latter organs of increased production instead of organs of the bolshevization of the German life."

Gasoline Engine Shovel

Announcement of considerable interest to contractors and chemical engineers as well as the clay products industry comes in the nature of a new gasoline engine shovel, manufactured by the Austin Machinery Corporation of Chicago. This shovel, as shown in the

NEW GASOLINE ENGINE SHOVEL

accompanying illustration, is not a makeshift adaptation, but an entirely new design built for gasoline operation. Air-controlled clutches enable the operator to manipulate with ease, and the cushion drive clutches of the swinging and crowding devices insure the necessary overlapping of operations. All movements may be quickly reversed at any time. The swinging machinery and hoisting drums are locked by means of automatic brakes when the power is shut off. Other features of the machine include a three-lever digging control, a "slam the dipper" door, insuring a clean dipper; a power boom hoist, quick replacement of clutch bands, and interchangeability of clutch parts.

Determination of Spelter by Measuring the Hydrogen Evolved

The Kauffman-Lattimer Co., manufacturer of scientific apparatus at Columbus, Ohio, has just put on the market the Cushman Coating Tester which has recently been designed by Dr. A. S. Cushman.

The determination of the weight and spelter coating by this method is based upon the action of hydrochloric acid upon the galvanized coating, collecting and meas-

uring the hydrogen gas evolved. The weight of coating may be determined upon flat sheets, corrugated sheets and formed culverts, by the use of differently shaped rings provided with the apparatus. The coating upon wire can be determined by placing a definite length of wire under the flat ring on a glass plate.

The metallic rings used are made of nickel, tinned iron or other acid-resisting metal and are fitted with No. 12 three-hole rubber stoppers. A measuring burette and leveling bottle are provided for collecting and measuring the hydrogen evolved.

The number of cubic centimeters of hydrogen measured at 20 deg. C. (68 deg. F.) multiplied by the factor provided with each ring will give the ounces of spelter coating per square foot of actual surface on one side of the culvert. By doubling this figure the coating in ounces per square foot of sheet surface can be obtained.

Recent Chemical & Metallurgical Patents

British Patents

Complete specifications of any British patent may be obtained by remitting 25c. to the Superintendent British Patent Office, Southampton Buildings, Chancery Lane, London, England.

Extraction of Hydrocarbons.—A mixture of sulphur dioxide and a ketone, such as acetone, is used for the extraction at ordinary temperatures of hydrocarbons from coal and for the separation of unsaturated from saturated hydrocarbons. Other ketones which may be employed are methyl ethyl ketone, diethyl ketone, methyl propyl ketone, and ethyl propyl ketone. The extraction may take place under pressure. According to examples: (1) Acetone is saturated with sulphur dioxide and allowed to remain at atmospheric temperature and pressure in contact with pieces of hard coal; by steam distillation of the reddish liquid produced a yellow oily hydrocarbon is obtained. Increasing the pressure gives a larger yield of the product; an apparatus is described in this connection. (2) The extraction of lignite or bituminous brown coal with the acetone-sulphur dioxide mixture yields a resinous wax-like substance, which apparently results from the action of the sulphur dioxide on the lignite and the solution in the acetone of the product. The lignite may previously be treated under pressure with alcoholic or aqueous caustic alkali and the residue after evaporation used for the acetone-sulphur dioxide treatment. (3) Crude naphtha, when extracted with the acetone-sulphur dioxide mixture, separates into two layers, the clearer of which, after evaporation of the acetone and sulphur dioxide, yields unsaturated hydrocarbons; the paraffine hydrocarbons remain in the other layer, being undissolved by the acetone-sulphur dioxide mixture. (4) The acetone-sulphur dioxide mixture is used for absorbing diolefines, and thereby separating them from other hydrocarbons employed or produced in their manufacture; an addition product of the diolefine and sulphur dioxide is apparently formed at ordinary temperatures, and this splits up on heating. (Br. Pat. 156,123; not yet accepted; H. PLAUSON, Hamburg, and J. A. VIELLE, Westminster. March 2, 1921.)

Chlorinated Hydrocarbons.—Chlorinated hydrocarbons of low boiling point are obtained by cracking oils of comparatively high boiling point in the presence of chlorine or hydrochloric acid. Steam may be introduced into the reaction; a contact material, such as quartz, porcelain, platinum and like metals, or metallic chlorides, may be present; and the reaction may take place under increased pressure. Specified starting materials are petroleum, mineral oils, solar oil, mazut, tar oils, resin oils, paraffine oil, and Galician or Roumanian gas oils. By elimination of chlorine from the products, diolefine hydrocarbons can be obtained. According to examples: (1) Equal parts of petro-

leum vapor, hydrochloric acid gas and steam are passed through a tube heated in a furnace. After condensation of the product and neutralization with lime, a mixture of hydrocarbons and chlorinated hydrocarbons is obtained, which can be separated by distillation. (2) Tar oil and hydrochloric acid or chlorine gas are passed over a white hot platinum spiral in an apparatus resembling an isoprene lamp. The high boiling fraction of the product is again passed through the apparatus, and the low boiling fraction of chlorinated hydrocarbons allowed to accumulate. (3) A mixture of an atomized gas oil and hydrochloric acid is forced into a heated retort. (4) A mineral oil is heated under pressure with concentrated hydrochloric acid solution in an autoclave, and after some hours the product permitted to distill over into a vessel containing lime. The chlorinated hydrocarbons deposited are then purified by fractional distillation. The reaction is facilitated by the presence of small quantities of chlorides, such as calcium, zinc, magnesium, aluminum, manganese or tin chloride. (Br. Pat. 156,139; not yet accepted; H. PLAUSON, Hamburg, and J. A. VIELLE, Westminster. March 2, 1921.)

Edible Yeast Preparations.—To improve the taste of yeast and to render it more digestible it is treated with hydrogen under heat and pressure. It may first be treated with a solution containing ammonium or sodium carbonate or borax and washed to remove the bitter flavor, and disintegrated in any known way. It is then treated with hydrogen at a pressure of 100 to 200 atmospheres and a temperature of 100 to 130 deg. C. The liquid thus obtained may be used directly, mixed with fats or oils to form an artificial milk, or dialyzed by electro-osmosis or otherwise to remove salts. The action is facilitated by the presence of small quantities of sodium chloride, or organic acids such as formic, acetic, tartaric or citric acid. The yeast may also be first reduced to a dry power and treated with hydrogen in this state. Catalysts such as nickel or palladium may be employed in masses, but not as powder. Higher temperatures and lower pressures may be employed, in which case the yeast must be washed after treatment. (Br. Pat. 156,153; not yet accepted; H. PLAUSON, Hamburg, and J. A. VIELLE, Westminster. March 9, 1921.)

Anthraquinone.—Anthraquinone is prepared by oxidizing anthracene, preferably dissolved or suspended in a liquid medium, by means of oxygen or an oxygen-containing gas in the presence of an oxygen carrier. Thus, oxygen is passed under pressure into a hot mixture of anthracene and acetic acid containing a little fuming sulphuric acid, or oxygen containing a small percentage of nitrous gases is introduced into a hot mixture of anthracene and acetic acid containing cobalt nitrate. Similarly, anthracene sulphonic acids can be oxidized to the corresponding quinone compounds. (Br. Pat. 156,215; not yet accepted; CHEMISCHE FABRIKEN WORMS AKT. GES., Frankfurt-on-Main, March 9, 1921. See also Pats. 156,538 and 156,540.)

Tanning.—A tanning process consists in the use of mixtures of heavy metal salts of lignin-sulphonic acids from waste sulphite liquors, with salts of other organic or inorganic acids such as sulphuric, formic, lactic acid, etc., and with or without addition of other tanning or non-tanning agents. The mixed salts precipitate glue and are stated not to flocculate in dilute aqueous solutions. The following examples are given: (1) Tanning is effected with a liquor containing about 2 to 3 per cent of tanstuff prepared by decomposing an aqueous solution of 100 kg. of sodium lignin-sulphonates with 100 kg. of crystallized aluminum sulphate. The solution may be used directly or evaporated to dryness. The leather obtained is then stuffed and dried. (2) Tanning is effected as in example 1 with a tanstuff prepared by decomposing 100 kg. of calcium lignin-sulphonates with 170 kg. of crystallized ferric sulphate, the calcium sulphate being filtered off. (Br. Pat. 156,186; not yet accepted; CHEMISCHE FABRIKEN WORMS AKT. GES., Frankfurt-on-Main. March 9, 1921.)

Catalytic Oxidation of Hydrocarbons.—Hydrocarbons are oxidized to aldehyde, ketonic or carboxylic compounds by passing a mixture of their vapor with oxygen over a catalyst of a non-basic character maintained at a temperature below red heat. Suitable catalysts are vanadic acid,

molybdic acid, and salts of uranic or chromic acid, distributed over a support, such as pumice. In this way anthracene is converted into anthraquinone; aromatic hydrocarbons with side-chains give a mixture of aldehyde and acid—e.g., toluene yields benzaldehyde and benzoic acid; and unsaturated hydrocarbons of high molecular weight are converted into acids. (Br. Pat. 156,244; not yet accepted; A. WOHL, Dantzig. See also Pat. 155,245. March 9, 1921.)

Acetaldehyde; Acetic Acid.—Acetaldehyde is produced by hydrating acetylene with steam under pressure and at a fairly high temperature. The reaction is facilitated by the presence of small quantities of acids, such as acetic acid, sulphuric acid, nitric acid, phosphoric acid and organic sulphonic acids, acid anhydrides or sulphur acids. Inert gases or vapors may be employed as diluents. The apparatus comprises a pressure chamber 1, surrounded by an insulating

jacket 2 and supported on legs 5 above a battery of gas burners 15, the hot gases from which pass between the chamber and the jacket to the flue 15^a. The chamber 1 contains the reaction spiral 3, a pyrometer tube 4, and is fitted with steam inlet and outlet pipes 1^b, 1^c, a manometer 1^a and a safety valve 1^d. The reaction tube 3 is made of steel, iron, nickel steel, aluminum steel, nickel copper, ferrosilicon, nickel covered with gold or of steel or other metals covered with platinum, iridium, osmium, gold, etc., or with an acid-resistant enamel. The mixture of acetylene and steam in equal volumes is forced through the reaction tube, heated to 250-300 deg. C. at a pressure of 5-10 atmospheres. The product is condensed, and the unchanged acetylene again circulated through the apparatus. The catalytic acid may be mixed with the reacting gases before passing into the apparatus. Acetic acid is obtained by introducing sufficient oxygen or air through the pipe 14 into the middle of the reaction tube 3. (Br. Pat. 156,152; not yet accepted; H. PLAUSON, Hamburg, and J. A. VIELLE, Westminster. March 9, 1921.)

Acetaldehyde; Acetic Acid.—Acetaldehyde or acetic acid is prepared by forcing acetylene through a conductive porous anode, the pores of which are filled with an insoluble mercury compound. The electrolytic bath being acidic, the mercury compound is continuously regenerated by anodic oxidation. The bath is maintained at such a temperature that the product is continuously distilled off, and the pressure may be reduced to facilitate the distillation. If the potential difference between the electrodes be maintained below the decomposition potential of water simple hydration of the acetylene to acetaldehyde takes place; whereas with a potential difference above the decomposition potential of water the acetaldehyde produced is immediately oxidized to acetic acid. A suitable electrolyte is phosphoric acid, and the anode may be formed of wire netting, or perforated or corrugated sheets made of iron, steel, nickel, nickel steel, ferrosilicon, iron-nickel or iron-aluminum alloys, or copper coated with platinum or gold. The mercury compound—e.g., mercurous oxide or mercury phosphate—may be employed as such, or mixed with oxides, peroxides or porous fibrous substances such as asbestos, paper, thread, wool or cellulose ester powder, with or without binding agents. An apparatus is described. (Br. Pat. 156,147; not yet accepted; H. PLAUSON, Hamburg, and J. A. VIELLE, Westminster. March 2, 1921.)

Preparation of Cellulose.—In the preparation of cellulose from ligneous plants and plant fibers, such as jute, hemp, manila, "cotton," reeds, bamboo, esparto and the like, the materials are digested with weakly alkaline or neutral lye containing one part of an alkali acetate and two parts of an alkali sulphite under pressure. Other inert salts may be present. The waste liquor may be acidified with sulphuric acid or sodium bisulphate, and a mixture of sulphurous acid and acetic acid boiled off, the residual liquor being evaporated to dryness and incinerated to produce a raw soda lye which may be converted for re-use by adding the mixture of sulphurous and acetic acids boiled off. The waste liquor may be treated with caustic lime and then with sodium sulphate, a solution of sodium acetate being obtained and calcium monosulphite and sulphate precipitated. Sulphurous and acetic acids may be obtained from the monosulphite and acetate and used for the preparation of fresh lye. (Br. Pat. 156,512; not yet accepted; M. MULLER, Finkenwalde, Germany, and O. HEIGIS, Pilsen, Bohemia, March 9, 1921.)

Removing Carbon From Iron and Other Metals or Alloys.—In a process for removing carbon from iron and other metals or alloys by means of oxygen, the admission of oxygen is regulated in such a manner that only so much metal oxide is formed as can again be reduced by the active carbon present so that oxidation and reduction take place at practically the same rate and at the same time. The bath in which the operation takes place is externally heated and maintained at a temperature not exceeding the melting point of the metal or alloy under treatment. The oxygen is admitted by means of inclined nozzles of small cross-section so that the bath is given a circulating movement by the action of the impinging gases which may also heat the bath. The oxygen may be used in the pure state or as air with or without admixture with oxygen or other gases. Thus the carbon is removed without any appreciable loss of substances such as manganese, chromium, silicon, etc. (Br. Pat. 156,548; not yet accepted; H. SCHUTZ, Düsseldorf. March 9, 1921.)

Upward Current Ore Classifiers.—The upward current is obtained by means of a head of water in the apparatus kept constant by a float and also independently adjustable.

Water is fed to the main chamber *a* through a pipe *l* formed in two relatively adjustable sections. The outlet of the lower section *n* is provided with a cover plate *o* spaced from its end, and is surrounded by a float *q* which carries a sleeve *p* controlling the area of the outlet from the pipe *n*. The water passes as shown by the arrows *t* to an outlet *e*. The material to be classified is fed with water to a chute *g* and passes down a passage *g'*. The heavy constituents fall to an outlet *h*, while the light constituents pass up with the water to the outlet *e*. (Br. Pat. 156,226; not yet

accepted; E. P. F. JALABERT, Constantine, Algeria. March 9, 1921.)

Nitric Acid.—In the preparation of concentrated nitric acid by the absorption of nitrous gases in strong sulphuric acid, the nitro-sulphonic acid thereby produced is decomposed by means of vapors of watery nitric acid. The latter, together with a gas, preferably containing oxygen—for instance, air—are passed into the bottom of a tower packed with acid-resisting material, down which the nitro-sulphonic acid is allowed to flow. Nitrous gases and vapors of nitric acid are evolved. The latter, on condensation, form red fuming nitric acid, while the former are condensed in water and used for decomposing further quantities of nitro-sulphonic acid. The nitrogen oxides obtained by passing air through the fuming nitric acid to decolorize it are similarly employed. The concentration of the denitrated sulphuric acid is 80 per cent. Br. Pat. 156,800; not yet accepted; NORSK HYDRO-ELEKTRISK KVAELSTOFAKTIESELSKAB, Christiania, March 16, 1921.)

Current Events

in the Chemical and Metallurgical Industries

Program of the Detroit Meeting of the A.I.C.E.

The thirteenth semi-annual meeting of the American Institute of Chemical Engineers will be held at Detroit, Mich., June 20 to 25 inclusive. A party of members from the East will leave New York for Albany on the Hudson Night Line at 6 p.m., Saturday, June 18, and take the Sunday night Detroit and Chicago boat sailing at 6 p.m. from Buffalo to Detroit, arriving there Monday at 8:30 a.m.

MONDAY, JUNE 20

Meeting at Hotel Statler

9 a.m. Business sessions, reports of council, officers and committees.

"Possible Developments of the Chemical Engineering Catalog," Dr. William M. Grosvenor.

10 a.m. Reading of papers.

Address of welcome by the Hon. James Couzens, Mayor.

"The Chemical Engineer and the Auto Industry," C. F. Kettering, chief of research, General Motors Corporation.

"The Manufacture and Application of Automobile Finishes" (illustrated), Dr. C. D. Holly.

"Monel Metal," W. M. Corse, general manager, Monel Metal Products Corporation.

"Manufacture of Pyroxylin Artificial Leather," G. C. Given.

12:30 p.m. Luncheon, Hotel Statler, \$1.25.

2 p.m. Excursion. Inspection of plant of the Cadillac Motor Co., Michigan Ave. special car.

5:30 p.m. Leave Hotel Statler for Boat Club, D. U. R. and Boat Club ferry.

6:30 p.m. Dinner dance at Detroit Boat Club. Informal, complimentary.

TUESDAY, JUNE 21

8 a.m. Leave by special interurban cars for Ann Arbor, Mich.

10 a.m. Inspection of laboratories and campus, University of Michigan.

12:30 p.m. Luncheon at Michigan Union, complimentary. Address by President M. L. Burton.

1:30 p.m. Reading of papers.

Address of President Wesson.

"The German and American Haber Synthetic Ammonia Plants" (illustrated), R. S. Tour, chief engineer, Nitrate Division, Ordnance Department, Washington, D. C.

"The Motor Fuel Situation," E. H. Leslie, associate professor chemical engineering, University of Michigan.

"The Relation of the Chemical Engineer to Highway Engineering" (illustrated), A. H. Blanchard, professor highway engineering and highway transport, University of Michigan.

"Evaporator Design," W. L. Badger, professor chemical engineering, University of Michigan.

"Control of Ferrous Materials in the Auto Industry," A. E. White, director department of engineering research, University of Michigan.

"Some Problems in Non-Ferrous Metallurgy," Dr. J. H. Ransom, chief of research, Michigan Smelting & Refining Co.

6 p.m. Dinner at Michigan Union, \$1.50.

8 p.m. Return by special interurban cars to Detroit. Those who wish to return to Detroit earlier may take the cars at 5 p.m.

WEDNESDAY, JUNE 22

9 a.m. Excursion. Leave by special cars for Ford River Rouge plant, D. U. R.

12 noon. Return to Detroit by special cars.

1 p.m. Luncheon at Board of Commerce, \$1.25.

3 p.m. Cars to ferry and Belle Isle Ferry to Walkerville. Inspection of plant of Hiram Walker & Sons, Ltd., Walkerville, Ont.

6 p.m. Barbecue on shores of Lake St. Clair, complimentary.

9 p.m. Return to Detroit.

THURSDAY, JUNE 23

8 a.m. Half-day boat trip, steamer Britannia.

12 noon. Return to Detroit.

2 p.m. Meeting at Hotel Statler. Reading of papers.

"Heat Treatment of Steel," W. A. Gatward, engineer, Hoskins Manufacturing Co.

"The Future of Aeronautics," W. B. Stout, chief engineer, Stout Engineering Laboratories.

"More Miles Per Gallon," O. C. Berry, chief engineer, Wheeler-Schebler Carburetor Co.

"The Determining Factors for the Life of a Pneumatic Tire," William G. Nelson, chemist, Morgan & Wright.

"A New Spray Nozzle for Acid Work," James R. Withrow.

"Evolution of the Glue Industry and Grease Extraction," Ludwig A. Thiele.

7 p.m. Subscription Dinner, Hotel Statler (informal), \$5.

FRIDAY, JUNE 24, AND SATURDAY, JUNE 25

Optional visits to manufacturing plants:

1. Diamond Crystal Salt Co., St. Clair. Trip will be made on Friday, June 24, boat leaving at 8 a.m. and returning in the evening. The plant of this company is the most modern and up-to-date of its kind in the world.

2. Parke, Davis & Co. Large plant.

3. Michigan Smelting & Refining Co.

4. Hoskins Manufacturing Co.

5. Acme White Lead & Color.

6. Detroit Edison Co., Conners Creek plant.

7. Morgan & Wright Co.

8. Detroit City Gas Co.

9. Dodge Bros. Motor Car Co. Fine plant.

10. Berry Bros. Paint and Varnish Manufacturing Co.

11. Schmidt Tanning Co.

12. Trus-Con Laboratories.

13. Detroit Sulphite & Paper Co.

14. Ford Motor Co.

15. Inland Delray Salt Co.

16. Pennsylvania Salt Co.

17. Michigan Stamping Co.

18. Burroughs Adding Machine Co.

19. Parker Rust Proof Co. of America.

Corrosion of Duralumin Sheet

An inspection has been made of corroded duralumin in the form of thin sheets used in the construction of all metal airplanes. The material became brittle in service owing to the development of intercrystalline "cracks" evidently as a result of corrosion. The attempt was made to produce the brittle condition in portions of the sheet which apparently were still ductile. By corrosion alone, as well as by the simultaneous action of corrosion and stress, it was possible to develop intercrystalline brittleness in the specimens. Annealing of the material, annealing followed by slight cold-rolling and severe cold-rolling of the commercial stock did not appear to affect materially the corrosion. In this case it appears certain that the deterioration was the result of the corrosion of the sheet. Brittleness developed because of corrosion from both acid and neutral solutions, but an alkaline attack did not appear to cause the development of brittleness.

Sodium Compounds in 1920

The production, imports and exports of sodium compounds all increased in the United States in 1920 over 1919, according to figures compiled by R. C. Wells, of the United States Geological Survey, Department of the Interior.

The sales of all sodium compounds and of metallic sodium amounted to 9,886,020 tons, valued at \$139,336,338, an increase of about 8 per cent in quantity and 17 per cent in value. The accompanying table shows the sales of the individual compounds.

SODIUM COMPOUNDS SOLD IN THE UNITED STATES
IN 1919 AND 1920

Product	1919		1920	
	Quantity (Short Tons)	Value	Quantity (Short Tons)	Value
Sodium acetate.....	778	\$116,667	1,020	\$143,887
Sodium benzoate.....	126	230,224	201	365,841
Sodium bicarbonate.....	134,962	3,486,635	188,906	4,256,715
Sodium bichromate.....	26,526	6,233,566	25,973	5,531,954
Sodium bisulphite.....	11,819	687,750	22,059	1,028,373
Sodium bromide.....	499	493,319	543	523,724
Sodium carbonate:				
Soda ash.....	981,054	29,895,343	1,242,490	39,083,726
Monohydrate.....	30,796	710,748	2,267	115,256
Trona.....			10,609	343,911
Sal soda.....	80,090	2,229,994	62,857	2,128,937
Sodium chloride (common salt)				
Salt in brine.....	2,850,639	1,423,424	2,819,881	1,834,362
Rock salt.....	1,642,057	6,240,450	1,683,020	7,338,079
Evaporated salt.....	2,390,206	19,410,820	2,444,002	21,334,840
Sodium citrate, tartrate, and bi-tartrate.....	33	58,128	45	67,115
Sodium ferrocyanide.....	3,437	1,346,285	2,930	1,318,049
Sodium fluoride and acid fluoride.....	(a)	(a)	934	210,782
Sodium fluosilicate.....	(a)	(a)	719	143,800
Sodium hydroxide.....	311,388	20,091,978	382,680	25,894,641
Sodium iodide.....	12	86,985	10	29,905
Sodium nitrite.....	676	151,621	140	56,184
Sodium phosphate.....	14,760	1,733,996	30,515	3,233,896
Sodium silicate.....	300,138	5,879,628	304,503	5,751,088
Sodium cyanide, peroxide and nitrate (refined)....	17,188	5,331,123	8,633	3,415,085
Sodium sulphate:				
Salt cake.....	134,685	2,035,543	184,946	2,076,350
Glauber's salt.....	42,087	860,977	44,479	963,293
Niter cake.....	83,402	271,424	308,638	788,544
Sodium sulphide.....	45,448	2,645,181	42,952	2,962,033
Sodium sulphite.....	()	()	3,778	197,782
Sodium tetraborate.....	28,518	4,351,891	35,281	5,674,012
Sodium thiosulphate.....	32,212	1,709,223	24,868	1,283,697
Other sodium compounds	2,190	1,144,883	6,141	1,240,477
	9,165,726	\$118,857,806	9,886,020	\$139,336,338

(a) Included in other sodium compounds.

(b) Included in sodium bisulphite.

Sodium bichromate, ferrocyanide, nitrite, thiosulphate (hyposulphite) and sal soda were the only compounds that showed considerable decreases in 1920. Several of the compounds made good advances over 1919, and sodium bicarbonate, bisulphite, phosphate and borax made new records.

NATURAL SALTS

The sales of sodium compounds derived directly from natural sources in 1920, exclusive of common salt, also probably made a new record. They amounted to 41,683 tons, valued at \$1,513,179, as compared with 29,120 tons, valued at \$874,083, in 1919. The salts included under this head are sodium carbonate, sulphate, trona and borax.

The following list gives the imports of certain salts in 1920 and the changes from 1919. Compounds in which there were no significant changes in imports over 1919 are not included:

Product	Quantity		Increase	
	(Short Tons)	Value	(Short Tons)	Value
Sodium carbonate.....	761	\$37,844	323	
Sodium chlorate.....	281	50,266	262	
Sodium chloride.....	137,654	686,499	78,140	
Sodium cyanide.....	3,795	1,091,443	1,208	
Sodium ferrocyanide.....	1,101	400,873	452	
Sodium nitrate.....	1,480,519	63,121,035	1,024,053	
Sodium nitrite.....	5,845	1,378,992	4,570	
Sodium silicate.....	330	15,162	131*	
Sodium sulphide.....	519	47,064	315*	
All other sodium salts	260	36,777	146	
	1,631,065	\$66,865,955	1,108,708	

* Decrease

The only compounds whose imports exceed the domestic production are sodium nitrate and nitrite. Moreover, the imports of sodium nitrate vastly exceed those of any other compound.

The following table gives the exports of domestic sodium compounds for 1919 and 1920. The table does not include foreign salts re-exported, chiefly sodium nitrate and common salt. It will be seen that good increases were made

in 1920. The total is believed to be a record. Japan, Canada and Mexico were the leading consumers of our exports.

DOMESTIC SODIUM SALTS EXPORTED FROM THE UNITED STATES IN 1919 AND 1920, BY CLASSES

Product	1919		1920	
	Quantity (Short Tons)	Value	Quantity (Short Tons)	Value
Sodium bicarbonate.....			10,321	\$616,261
Sodium carbonate:				
Soda ash.....	50,481	\$2,656,608	8,338	4,689,591
Sal soda.....	5,563	178,285	6,015	220,487
Sodium chloride (common salt).....	119,416	1,396,625	139,278	1,901,593
Sodium hydroxide (caustic soda).....	82,118	6,748,762	112,069	10,944,007
Sodium silicate.....	12,150	338,818	17,048	450,770
Sodium tetraborate (borax).....			7,163	1,206,936
All other sodium salts....		7,226,322		7,161,784
		\$18,545,420		\$27,191,429

PRICES

The prices obtained for sodium compounds in 1920 were generally better than those in 1919, although toward the end of the year the prices of most of the salts fell to about the levels they reached at the beginning of the year. Jobbers' prices appeared to be an accurate index of the consumers' demands. Sodium sulphate was in especial demand in 1920 on account of foreign bids, and it closed the year at a slightly higher price than in the previous year. The price of sodium bichromate was at one time higher than it was during the war, but fell abruptly later in the year.

In view of the differences that still exist in the costs of the various items that make up the costs of manufacture existing prices of sodium compounds now appear to be practically down to pre-war levels.

Circuit Court Reverses Federal Trade Commission on Gasoline Container Ruling

The United States Court of Appeals for the Second District has handed down a decision reversing the ruling of the Federal Trade Commission of April 27, 1920, which ordered the Standard Oil Co. of New York and the Texas Co. to cease furnishing gasoline containers to retail dealers at a nominal rental.

The ruling was made by the Federal Trade Commission, after taking a great deal of testimony, to the effect that both companies were engaged in the practice of supplying tanks, pumps and other devices to retail dealers for the supplying of gasoline to automobiles, for which only a nominal rental was charged. The commission found that neither company was engaged in the manufacture of such equipment, and held that such practice tended to create a monopoly, inasmuch as the retail dealer would furnish only gasoline made by the company which supplied the equipment.

The petitions of the companies for a reversal of the order were submitted to the court without argument.

The opinion of the court, which was written by Judge Hough, states that the court was unable to find there was any contract between the companies and the retailers by which the latter were restricted to the use of a certain container or from selling any brand of oil. The court held, however, that it would be unfair and dishonest for a retailer to sell the product of one company from the container supplied by another and that all that secured trade for the wholesaler was the amount of business which the retailer could secure in his community through obviously fair and honest practices.

It was possible, the court held, that where any system of distribution of an article of prime necessity and enormous consumption is well established, temptation may arise through competitive distribution to enter into treaties for regulation of price, classification of customers and division of the areas supplied, thus creating a sphere of influence—one for each of the distributing parties.

However, the court held that such a condition did not exist under the facts submitted, and from the testimony adduced at the hearing, held that the system was extremely advantageous to the company, economical and not unfair in law. The leases as made, the court held, did not constitute a violation of section 3 of the Clayton act and the ruling of the commission was ordered reversed.

Conferees Agree on Emergency Tariff Bill

With the exception of a reduction from six to three months in the time during which the War Trade Board may continue to exercise its authority over dye imports, the dye-stuffs title of the emergency tariff bill was unchanged by the conferees. The conferees agreed upon various compromises at a late hour on May 18, after a series of very acrimonious sessions. The principal differences between the conferees, however, had to do with the administrative features of the bill.

Merchants' Association of New York Urges Increase of Patent Office Salaries

In accordance with action taken by the board of directors of the Merchants' Association of New York appeal has been made to Congress to increase the personnel and compensation of the employees in the Patent Office. This appeal took the form of a letter addressed by S. C. Mead, secretary, to the members of the Committee on Patents of the House of Representatives as follows:

The Merchants' Association of New York desires to be recorded with you, as chairman of the House Committee on Patents, as in favor of the enactment of H.R. 210, a bill to increase the force and salaries in the Patent Office. As we understand it, this bill is identical with H.R. 11984 in the former Congress, which finally failed of passage.

Our committee which has jurisdiction over these matters is of the unanimous opinion that an increase in the personnel and morale of the employees in the Patent Office is necessary in order to clean up the large amount of applications awaiting the attention of the Patent Office.

In this connection we desire to be on record as in favor of the bill as it now stands and to record our opposition to the amendment which was attached to H.R. 11984 while in the Senate, this amendment providing for placing in the hands of the Federal Trade Commission jurisdiction over certain patent procedure. It is the belief of the Merchants' Association of New York that the enactment of H.R. 210 in its present form and without any such amendment as was added to the former bill is desirable.

Superpower Survey Meeting

Prior to completing its final report on June 30, the Superpower Survey held a meeting in New York on May 13 at which members of its advisory board and several guests were invited to discuss the physical, legal and financial phases of the problems under consideration. Prof. L. P. Breckenridge, chairman of the advisory board, presided. W. S. Murray, chairman of the Superpower Survey, discussed the physical features, E. G. Buckland, vice-president, New York, New Haven & Hartford Railroad, the legal aspects and W. S. Barstow, president, W. S. Barstow & Co., the financial phases. In addition to those just mentioned, the following were present: Dr. George Otis Smith, director of the United States Geological Survey, which is conducting the superpower survey; General Guy E. Tripp, chairman of the board, Westinghouse Electric & Manufacturing Co.; Thomas E. Murray, president of Thomas E. Murray, Inc., consulting engineer; H. I. Harriman, president, New England Power Co.; A. J. Sheldon, Lee Higginson & Co.; M. W. Alexander, chairman National Industrial Conference Board; C. L. Edgar, president of the Edison Electric Illuminating Co. of Boston; George Gibbs of Gibbs & Hill, consulting engineers; Colonel Charles Keller, Board of Engineers for Rivers and Harbors; Arthur D. Little, of Arthur D. Little, Inc., chemist; James H. McGraw, president McGraw-Hill Co., Inc.; J. H. Pardee, president J. G. White Management Corporation; Walter Thayer, Pennsylvania R.R.; Henry Flood, Jr., engineer-secretary Superpower Survey.

PHYSICAL ASPECTS

W. S. Murray in his summary of the physical aspects of the survey pointed out that had the facilities which he is advocating for the superpower zone been in existence during 1919 the coal savings would have amounted to 4,300,000 tons for the utilities, 9,566,000 tons for the railroads and 11,000,000 tons for the industries, or a grand total of 24,866,000 tons. If the generation of power continues unco-

ordinated, he contended, the annual coal waste will be 50,000,000 tons by 1930, which at \$5.35 a ton would represent a monetary loss of \$266,500,000. Mr. Murray estimated that the project would require \$100,000,000 each year for the next ten years.

DISCUSSION

In answer to E. G. Buckland, who asked how much less than \$100,000,000 per year would be required by the separate utilities to take care of increasing business without the superpower company, W. S. Murray said that more money would be required for construction by individual companies than would be necessary for the superpower system.

Mr. Edgar agreed with Mr. Murray that there was nothing in the superpower proposition that has not already been done. What has already been done over 600 miles will be applied to over 30,000 miles. The educational value of Mr. Murray's report should be great, he said.

The legal and financial phases were also discussed at length. Several important legal difficulties which would have to be overcome were cited by H. I. Harriman in the development of his argument that the superpower company should be organized under a federal charter rather than under a charter granted by any state. He indicated several obstacles to interstate business embodied in laws of several of the New England States. These obstacles he thought could be overcome more readily under a federal charter. On the other hand, Dr. George Otis Smith said that the project should not be owned or operated by the Government and called attention to the conservation by the project of financial as well as physical resources.

Regarding the educational value of the project James H. McGraw said that the superpower plan should appeal to the "man in the street" because the results can be demonstrated. Prof. Breckenridge pointed out that the wage earner in this country uses two and a half to three and a half times as much power as the wage earner in Europe—another strong appeal to "the man in the street."

To Urge Continuance of Muscle Shoals Dam

An investigation of the whole Muscle Shoals proposition has been made by a committee of the Farm Bureau Federation. This is the principal organization of farmers represented in Washington. The committee is now preparing its report and declines to comment on it in advance of its completion, but it is understood that it will urge strongly the resumption of work on the Wilson dam at Muscle Shoals at the earliest practicable moment.

Representative Graham, who as the head of the committee which investigated war expenditures evinced particular enmity to the Muscle Shoals project, has introduced a bill authorizing the Secretary of War to lease the dam and Nitrate Plant No. 2. The Farm Bureau committee is said to be opposed to any such plan because of the difficulty likely to arise in arranging for the manufacture of cyanamide by other than the Government. Other objections are that Congress would demand such safeguards in connection with a lease as to make it impracticable from the commercial standpoint. The Graham bill provides that the Secretary of War may lease Plant No. 2 for a period not to exceed twenty years to any co-operative agricultural association or corporation. The lease is to include the steam power plant and may be extended so as to empower the lessee to complete the dam. The bill provides that the lessee must provide a bond to guarantee the maintenance of the plant in good condition. It is to be surrendered to the United States at any time on the demand of the President when it may be required for military purposes. The bill further specifies that the plant must be maintained as an air nitrate operation.

Chemical Warfare Service Appropriation

The appropriation for the Chemical Warfare Service for the next fiscal year is \$1,350,000 in the Army bill as passed by the House. An effort will be made to increase the amount in the Senate. This is one-sixth of the amount originally requested by General Fries and less than one-third of the amount declared by the Secretary of War to be necessary to the proper conduct of that service.

Physical Methods for the Chemist

Optical methods as servants of the chemist were discussed in a symposium at the Chemical Society of Washington on May 12. At this time five speakers developed various phases of optical measurement or investigation which afford large promise in both the routine and the research branches of pure and applied chemistry.

QUANTITATIVE SPECTRUM ANALYSIS

"Quantitative Spectrum Analysis" was the title of the first paper, which was by W. F. Meggers, of the Bureau of Standards. This speaker pointed out that following the elementary use of the platinum wire and bunsen burner for identification of materials by the color of the flame most chemists fail to utilize spectrum analysis further in their scientific work. It has quantitative as well as qualitative possibilities in chemical as well as in stellar analysis, and with the proper recognition of modern methods is applicable to a number of particularly difficult analytical problems.

SPECTRO-PHOTOMETRIC METHODS

W. E. Mathewson, of the Bureau of Chemistry, discussed the application of spectro-photometric methods to the estimation of colorless substances. Using a suitable spectro-photometer the accuracy depends upon the matching of the brightness of two fields. With ordinary light this matching cannot be accurately done because the percentage change in transmission of white light is not of sufficient magnitude in most cases. However, using monochromatic light or observing the transmission of certain parts of the spectrum a much greater percentage variation of the transmission can be noted with a given change in concentration. Dr. Mathewson applies this method to solutions of colorless materials after treatment of the material to be identified so that it is converted into a colored substance or dyestuff.

DIRECT-READING SPECTRO-PHOTOMETER

I. G. Priest described the form of direct-reading spectro-photometer for measuring the transmissivity of liquids which he has developed at the Bureau of Standards. A beam of monochromatic light is divided into two parts, one of which passes directly to the observing telescope through a sector disk of variable transmission. It is compared by photometric methods with the second part of the beam which passes through the solution to be tested. The distance between the inlet and outlet prisms which conduct the light into and out of the solution may be varied. An equal brightness of the two beams can be established either by adjusting the opening in the sector disk or by varying the distance between the prisms—that is, varying the distance within the solution through which observation is being made. The instrument reads directly in terms of the extinction coefficient or the percentage transmission, as well as in terms of depth of liquid and percentage transmission of the disk.

The apparatus is applicable to colorimetric investigation of vegetable oils, dyestuffs, sugar solutions and other colored liquids. Moreover, the results give a scientific definition of color independent of the characteristics of the illumination or the personal defects of vision of the observer.

POLARIMETRY

F. J. Bates, chief of the sugar laboratories of the Bureau of Standards, discussed the possibilities and applications of polariscopic methods in chemical investigations. He pointed out that for many years an error in the standards of about one-tenth per cent was the cause of many unexplained discrepancies in this work. However, this cause of difficulty has now been eliminated and it is possible to do polariscopic work with apparatus good to one one-thousandth circular degree and with apparatus of variable sensitivity suitable for a wide variety of materials.

Tool's application of the Brace half-shade principle permits further work on double refraction of materials under strain and measurement of different phenomena. This combined with determinations of magnetic rotation affords possibilities for the identification of oils. For example, a

single observation is often sufficient to show whether a fuel oil or gas oil is a straight-run product or has been partly cracked. Obviously the straight-run oil is vastly more satisfactory for gas making or gasoline manufacture than an oil which has already been partly cracked. Therefore this difference is of very great importance. Similar applications in other fields are expected by Dr. Bates.

CRYSTAL OPTICS

F. E. Wright, of the Geophysical Laboratory, discussed the application of crystal optics in chemistry. He pointed out that the methods used in this field are of much greater complexity from a practical standpoint than in the other fields discussed. Long and continued experience in the use of these methods is of greater importance than in the other cases, and it is obvious, therefore, that the chemist cannot expect to get as much in this province of optics as in the others.

University of Chicago Reports Favorably on Plan for Scientific Research

Wallace Heckman, counsel and business manager of the University of Chicago, in his annual report favors the plan for promotion of scientific research as outlined by William Hoskins and Russell Wiles in *CHEMICAL & METALLURGICAL ENGINEERING*, issue of April 20, 1921, page 689. The text of his announcement is as follows:

"Men engaged in research in our scientific laboratories frequently obtain results of importance which, if accomplished in commercial laboratories, would be gratifyingly valuable in financial returns.

"It is well known that the reports, addresses and talks of advanced scientific men are closely attended to by those who are acquainted with the value of what is being done and discovered, and these discoveries are actually patented and realized upon by those having no relation to the work and not entitled to those returns.

"This laboratory work is conducted upon high ethical principles, and the individuals conducting these researches disdain to derive the personal benefits from them which the law would justify. If, to the results of this work educationally and scientifically, its financial value can, without injury to these other values, be conserved, it would place the institution in possession of additional and legitimate resources.

"The advantage of such a course to these laboratories would seem to be obvious. These legitimate returns might reasonably be expected ultimately to provide the amplest equipment and provisions for these departments."

It is interesting to note that the text of the article mentioned above was submitted by Mr. Hoskins to the university many months ago and the official notice of the favorable action of the university was not made public until May 9, 1921.

Weights and Measures Conference

The fourteenth annual conference on weights and measures is in session (May 23-26) at the Bureau of Standards in Washington. Pending legislation looking to the adoption of the metric system of weights and measures is to be one of the subjects discussed at this conference. Other matters which will be taken up include: The slack-filled package bill; proper sealing of commercial weighing and measuring apparatus; the weight problem in interstate commerce; enforcement of bread weight legislation; testing of liquid-measuring devices; standardization of containers for food; net weight-marking on packages of commodities other than foods.

Chemical Exhibition at Wilmington

During the week of May 10 the National Research Council, Washington, D.C., held an interesting and instructive chemical exhibit in the lobby of the Hotel du Pont, Wilmington, Del., under the direction of Major H. S. Kimberly. The exhibition covered the work of the Chemical Warfare Service, and was brought to the city through the efforts of the local Chamber of Commerce. A complete model of an American dye manufacturing plant was also shown.

Supreme Court Ruling on Mixed Acid

The Supreme Court of the United States in an opinion May 16 in the case of the United States vs. the Aetna Explosives Co. ruled that "The applicable tariff act granted free entry to both nitric and sulphuric acids and viewed practically the commodity in question was nothing more than nitric acid rendered non-injurious to steel tanks by adding sulphuric acid of small value. The two acids do not interact and the result was a mere mechanical mixture not intended or adapted as such for commercial use and not a chemical mixture," within the true intent of the statute. The case arose from the importation of nitric acid by the Aetna Explosives Co. from Canada during the war. The acid, intended for use in the manufacture of explosives for the Navy, was mixed with sulphuric acid in order that it might be shipped in compliance with the law. Customs officials ruled that this mixture formed a new compound which was dutiable.

Improved Conditions in Leather Industry

Recovery from the abnormal conditions which existed in the leather industry during 1920 is indicated in the following statement by Vice-President Julius Hollander, of the Amalgamated Leather Co.:

"The leather business looks very promising. It is bound to increase as the season progresses and I sincerely believe that we are going into quite an active season. Stocks of raw skins in this country are very small. The situation is righting itself very materially. In our business we are getting hurry calls right along for kid. Buyers are purchasing today from necessity because of depleted stocks. This makes for a fundamentally sound condition. In 1919 if a man needed only 1,000 dozen skins he would buy perhaps 2,000 dozen. Today the situation is reversed. There is no disposition to load up."

Electric Heating Exhibit

During the week of June 6 practically all of the electrical appliances for industrial and domestic heating that have been perfected within the past five or ten years will be exhibited at the showrooms of the New York Edison Co., Irving Pl. and 15th St., New York. Forty-one manufacturers will be represented and at least one hundred different applications of electric heat will be shown. These include self-contained units for localized heating capable of producing very high temperatures, tubular heaters for oil, paraffine and other flammable liquids where an exposed flame is dangerous and a wide range of industrial heating equipment.

No admission fee will be charged and the show will be open every day from 9 a.m. to 6 p.m.

Many New Chemical Companies Formed

During the first four months of the present year new chemical companies with an aggregate capital of \$49,900,000 were organized and incorporated in the United States, as compared with a total capitalization of \$64,863,000 for similar industries in the same period of 1920. In March thirty-two companies with individual capitalization of \$50,000 and over were formed, with an aggregate capital of \$11,765,000. In April twenty-eight such companies were organized, with a total aggregate capitalization of \$9,390,000. In April, 1920, the companies in this line which were formed had a total capital of \$4,675,000.

Reprint of Nitrogen Report Asked

A resolution has been introduced in the Senate asking that a reprint be made of the report of the Secretary of Agriculture concerning ammonia, nitrogen and nitrogenous materials manufactured, imported and used in the United States. The report was sent to the Senate April 8, 1918.

No Chance for National Daylight Saving

It has been decided definitely by the committees of Congress having jurisdiction over daylight saving bills that the subject is not to be given consideration. This puts an end to the hope that daylight saving might again be made national during the coming summer.

Chemical Exhibit Draws Crowd

When the National Research Council obtained permission to display its chemical exhibit in the caucus room of the House Office Building a precedent was established in that this is the first time that an exhibit of this character has been staged in the halls of Congress on Capitol Hill. The exhibit was on display throughout the week beginning May 16. Since Capitol Hill is the mecca of every tourist and most business visitors to Washington, an opportunity was given to enlighten a large number of persons as to the relationship between the chemical industry and the national defense.

The exhibit was made realistic and attractive by models showing how the crude materials were carried through their various processes. Special effort was made to emphasize the fact that the primary processes are the same whether the products are to be those of peace or those of war.

An interesting part of the exhibit was the display of American-made dyes, flavoring extracts, coloring extracts, perfumes and coal-tar products. There were cleverly executed charts bringing out some of the salient facts concerning the relationship of chemistry and the national defense. The Chemical Warfare Service also displayed one of its exhibits. Judging from the expressions of visitors it was clear that the exhibit was successful in that it demonstrated that the wizardry of the chemist is essential for industry as well as for war.

Personal

T. E. BARKER, for fourteen years production manager of the Miehle Printing Press Co., Chicago, has resigned to accept a post with the Denver Rock Drill & Manufacturing Co. Mr. Barker has been prominently identified with the early development of the American Society for Steel Treating, serving as first chairman of the Chicago Section of the Steel Treating Research Society, two years as national president of the American Steel Treating Society, and is now acting as first vice-president of the American Society for Steel Treating.

W. F. CARMAN of the China Chemical Co., New York, has returned from a business trip to Europe.

CHESTER M. CLARK, formerly head of the corporation department of Stone & Webster and secretary of the underlying corporation of Hog Island, has become treasurer of Arthur D. Little, Inc., in the place of W. W. Caswell.

SIDNEY COHN, president of the Pacific Chemical Co., New York, sailed on the Mauretania, May 12, for a four months' business trip in England, France and Germany.

BENJAMIN S. DOWELL of the du Pont Chemical Co., Elkins, W. Va., has been appointed secretary of the local Chamber of Commerce.

J. A. GERBER has resigned as manager of the chemical department of the Caravel Co., New York, to organize the Federal Chemical Co., Nitro, W. Va., of which he will act as head.

ANDREW H. GREEN, JR., formerly manager of the Detroit plant and also vice-president in charge of the Detroit works of the Solvay Process Co., was recently placed in complete charge of all technical and operating departments of the company, with headquarters at Syracuse, N. Y.

DONALD M. NELSON, who has worked up through the chemical organization of Sears, Roebuck & Co., has recently been made manager of the clothing department for this concern. Mr. Nelson is looked upon by the chemical profession of Chicago as being one of the best informed men in the textile industry.

T. A. PATTERSON has resigned his position as assistant superintendent of the Niagara Alkali Co., Niagara Falls, N. Y., to accept a position as superintendent of the Belle Alkali Co., Belle, W. Va.

Dr. FREDERICK BELDING POWER, in charge of the phytochemical laboratory of the U. S. Department of Agriculture,

has been presented a gold medal by Henry S. Wellcome, of London, in recognition and appreciation of distinguished services to science as director of the Wellcome Chemical Research Laboratories. Dr. Power has been with the federal government at Washington for several years, but was in London for more than eighteen years engaged in the work for which he has been thus honored.

HUGO SCHLATTER of Wilmington, Del., who for several years has been manager of the Chemical Products Division of the Hercules Powder Co., has resigned his position and is planning a trip to Europe in June. While abroad Mr. Schlatter will visit a number of manufacturing plants and will make special investigations and reports for firms in the United States which have taken advantage of the opportunity to have him execute technical commissions for them.

MARTIN R. SUMNER, formerly chief engineer for New England for Fred T. Ley & Co., and of the staff of the Fuller Development Co., has joined the staff of Arthur D. Little, Inc., as chief engineer.

Obituary

GEORGE J. FORAN, engineer, art collector and member of the committees on condensing apparatus of the U. S. Shipping Board and the War Industries Board during the war, died recently at his home in New York City, after an illness of several weeks. Mr. Foran was manager of the condenser department of the Worthington Pump & Machinery Corporation and the associated companies of the International Steam Pump Co. from 1901 until his death. He was born in Boston, Mass., Jan. 22, 1862.

FRANKLIN KNIGHT LANE, Secretary of the Interior in President Wilson's Cabinet, died at Rochester, Minn., May 18. Mr. Lane was born near Charlottetown, Prince Edward Island, on July 15, 1864. In his childhood the family removed to California and he was educated at the University of California, class of 1886. He then engaged in newspaper work, came to New York for a time as the correspondent of various Western papers and later became editor and part owner of the Tacoma (Wash.) *Daily News*. Having been admitted to the California bar in 1889, he engaged in legal practice and began to give some attention to politics. His first public office was that of corporation counsel of San Francisco, which he filled from 1897 to 1902. In 1905 President Roosevelt appointed him a member of the Interstate Commerce Commission, in which place he remained for eight years. He won the reputation of being a constructive statesman of broad principles and progressive ideas and attracted the favorable attention of men of all parties throughout the nation. Indeed, his repute became international, for in 1910 he was elected a member of the permanent International Railway Commission which was organized at the International Railway Conference at Berne, Switzerland. Mr. Lane was made Secretary of the Interior in the first Cabinet of President Wilson in 1913. During America's participation in the World War, Secretary Lane was a member of the Council of National Defense and was active in Red Cross affairs and was chairman of the National Industrial Conference which was convened because of conditions created by the war. As chairman of the Railroad Wage Commission in 1918 he was chiefly to be credited with averting a number of strikes and settling numerous disputes. At the end of the war he was energetic and farseeing in plans for the restoration of normal conditions. He devised methods for the profitable employment of the returning troops, advocating legislation which would settle upon agricultural lands all soldiers who wished them, and urged Congressional legislation for the complete naturalization of all foreign-born soldiers. On Feb. 7, 1920, he sent to the President his resignation, to take effect on March 1 following. The reason which he gave for this action was the necessity that he should "think of other duties." Mr. Lane received the honorary degree of LL.D. from New

York University, the University of California and Brown University. He was married on April 11, 1893, to Miss Anne Wintermute, of Tacoma, Wash., who survives him with their two children—Mrs. Nancy Lane Kauffman, of Washington, and Lieutenant Franklin K. Lane, U. S. A., of Los Angeles, Cal.

JOHN MCQUADE, president of John McQuade & Co., Brooklyn, N. Y., manufacturer of paint, died recently at his home in that city.

CHARLES HOSMER MORSE, founder and chairman of the board of directors of Fairbanks, Morse & Co., died May 5 at his home in Winter Park, Fla., after an illness of several weeks' duration. Mr. Morse was a pioneer in the field of oil engine development, having worked with the inventor of the gasoline engine, James A. Charter, in the early '90s and subsequently developed considerable apparatus in the electrical and railway appliance fields. He is survived by his wife, Helen H. Morse, and two sons, Charles Hosmer and Robert Hosmer, both of whom have been associated with him in business for many years.

Dr. EDWARD BENNETT ROSA, chief physicist of the Bureau of Standards, died suddenly at his desk on May 17. Dr. Rosa was born in Rogersville, N. Y., in 1861 and was graduated from Wesleyan University, Middletown, Conn., in 1886. Five years later he received his doctor's degree from Johns Hopkins University. He returned to Wesleyan as a professor of physics, where he invented a number of measuring instruments, besides conducting important investigations in dielectric measurements, alternating-current wave forms, electromagnetic units, etc. In 1901 he joined the Bureau of Standards as a physicist. Much of the work which was done under his direction at the bureau is of fundamental importance to electrochemical as well as electrophysical investigations. These researches include studies of dry cells and storage batteries, the basic work on the mercury ohms, standard cell investigations of international significance, and the finest work on the silver volt-ammeter which has ever been done. Dr. Rosa had an exceptional appreciation of the value of chemistry and the chemist in physical research, and was most successful in combining physics and chemistry for fundamental work that neither science alone could accomplish. He was a fellow of the American Institute of Electrical Engineers, a former director of the Illuminating Engineering Society and was one of the most active members of the American Engineering Standards Committee. Dr. Rosa had been a member of the International Electrical Commission, was honorary secretary of the International Electrical Congress held in San Francisco in 1914, and in 1913 was elected to the council of the French Physical Society.

ADOLPH SORGE, JR., well known in engineering circles in Chicago, died May 5. Mr. Sorge was a graduate of the Stevens Institute of Technology of the class of 1875. After leaving school he went with the E. W. Bliss Co., Brooklyn, N. Y., and in 1893 he became general manager of the Wood-Mosaic Co. of Rochester, N. Y. While in Rochester he acted as adviser to Selden in framing the claims of the famous automobile patent subsequently issued to the latter. In 1895 he became general Western representative of the Harrison Safety Boiler Works of Philadelphia, subsequently incorporated as the H. S. B. W.-Cochrane Corporation. He was the first to see the advantages of heat in the chemical treatment of water for the removal of hardness, and the present Sorge-Cochrane hot process water softener is a further development of ideas originally patented by him. He was often consulted on steam plant problems and his skill in rectifying defective steam plant piping was widely known throughout the West. He was one of the originators and founders of the Technical Club of Chicago and was also a member of the Engineers clubs of Chicago and New York, as well as of the American Society of Mechanical Engineers. His command of concise, perspicuous English was exceptional and he also spoke French and German fluently, enjoying an extensive acquaintanceship among European engineers. His home was in St. Joseph, Mich., where he gratified his love for country life and things agricultural. His wife survives him.

Current Market Reports

The Chemical and Allied Industrial Markets

NEW YORK, May 23, 1921.

The general condition of the chemical market during the past week has been somewhat similar to that noted recently. There is a marked gradual increase in confidence all around and outside developments seem to be working favorably toward establishing the market on a stable basis. Although buyers have not come into the market to any appreciable extent, the influx of miscellaneous inquiries is growing larger and there is no doubt that consumers are taking a greater interest in market developments than for some time past. There have been several large inquiries on the market from Japan, and while these have not resulted in the actual consummation of important business it is very significant that conditions are improving in the East. It looks as if the Orient will be a large buyer before the year is over. The passage of the emergency tariff bill by the Congress will regulate the prices at which foreign sellers can compete with domestic commodities. *Nitrite of soda* responded immediately to the prospects of the tariff law becoming effective in the very near future.

READJUSTMENT OF FREIGHT RATES NEEDED

One of the most unfavorable features confronting the chemical producers at the present time is the railroad freight situation with its abnormally high rates. A reduction in rates would no doubt have a stimulating influence on many branches of industry throughout the country. With a prompt reduction in freight rates a readjustment of prices will likely take place on the more important basic chemicals. The signing of the reparations agreement with the German Government is an important factor toward speeding up reconstruction work, which is practically depending on the industrial world. A general reduction in labor costs is spreading in various parts of the country without any noticeable disarrangement. In summarizing, it is apparent that freights are going to be lowered. Costs are being regulated more closely and the foreign situation has shown signs of a gradual improvement. It seems almost certain that a credit system will be established with Europe to permit the purchase of raw materials. All these features show that the intense problems facing business are being slowly solved and the drift of events is decidedly encouraging to the restoration of better times.

CITRIC AND TARTARIC ACID PRICES DECLINE

Among some of the price changes during the week was a decline in *citric acid* prices on spot and a similar decline in imported *tartaric acid* quotations. The absence of any demand has brought on a keener state of competition among holders and price shading was inaugurated with the idea of increasing business. Makers of *acetone* reduced prices more in line with the cost of production. *Yellow prussiate of soda* held its recent advance well, under small lot trading. *Nitrite of soda* was one of the strongest items on the list and the position of the market appears much stronger through prospective tariff legislation. Solid *caustic soda* and light *soda ash* have remained very steady with producers placing fair sales for domestic use in soap, textile and glass industries.

CHEMICALS

Strength in the spot market on *bichromate of soda* was a feature and a good call was reported for small lots from the consuming trade. Resale offerings are relatively small and sellers are asking 8@8½c. per lb. for standard brands with sales reported at the inside figure. Some resale domestic *caustic potash*, 88-92 per cent, was offered at 5½c. per lb. on spot. There are sellers of the imported at 6c. and upward depending upon quantity. Producers'

views are unchanged on this grade and 12c. per lb. was being quoted f.o.b. works. Manufacturers report sales of *chlorate of soda* at 7½c. per lb. works for prompt shipment. A moderate inquiry is reported for domestic consumption. Sales of *nitrite of soda* were made during the week as high as 7¾c. per lb., with some sellers asking all the way up to 8½c. Some holders have withdrawn their offerings from the market, as they are firm in the belief that higher prices will soon be recorded. Buyers are showing considerably more interest in the situation and there is a very confident feeling in trade circles. Dealers in foreign *prussiate of soda* report a firm spot market and state that business is going through in small lots at 12½@12¾c. per lb. Offerings are not heavy and there seems to be a disposition to tighten up in some quarters. Resale offerings of light *soda ash* are gradually decreasing and the spot market shows an extremely firm tendency. Most dealers are not willing to shade \$2.10 per 100 lb. on single bags and some are asking above this figure. The best price heard on ash in barrels was 2¾c. per lb., while 2½c. was asked in several directions for limited quantities. Dealers in *bleaching powder* report additional sales on a basis of 2¼c. per lb. f.o.b. works in large drums. Spot material is held at 2¼c. and upward according to quantity. Resale lots of *sulphide of soda*, 60-62 per cent, fused, were offered at 5½c. per lb. spot N. Y. There is a pronounced scarcity of resale offerings of ground sulphide and the market is quoted firm. *Yellow prussiate of potash* continues in relatively limited supply and the market is quoted steady at prices ranging from 26@28c. per lb. Demand has not been markedly active for this chemical, but buyers have found a stiff proposition when they attempted to operate. Trading in *formaldehyde* is reported at 14½c. per lb. on spot in barrels. The price range extends upward to 15c. depending upon quantity and seller. Small lots continue to merit the most attention, but there seems to be an absence of round lot transactions.

COAL-TAR PRODUCTS

A gradual improvement in the various industries which directly affect the coal-tar products market is commencing to be reflected in different quarters of the trade by inquiries and orders for items that have long been dormant. Silk piece goods business is picking up and the woolen market is rapidly gaining strength. Along the line of colors and dyestuffs, the reports of manufacturers find the demand spreading. A good call from foreign sources has started and an immediate improvement in this field is expected to continue along steady lines. With the emergency tariff bill and protection against dumping practically assured, the general tone of the market is far more optimistic than at any previous time this year.

The intermediate market is decidedly firmer and calls have been received recently for some inactive items. Factors in home quarters report a regular supply of *alpha naphthylamine*. The volume of inquiries is light and very little business is said to be passing. Prices have shown very little change from the former level and range from 35@40c. per lb. The market for *anthracene* is of a routine nature, with a limited supply moving into consuming channels. There has been no change in the market price, which ranges from 85c.@\$1 per lb. for the 80 per cent grade. The consuming demand for *phthalic anhydride* continues along routine lines and the same may be said of the crude. Supplies are easy with quotations ranging from 50@60c. per lb. Business in most quarters on *alpha naphthol* is reported as dull. Producers have made no recent change in prices, which are quoted on a basis of \$1.10@\$1.15 per lb. for the crude and \$1.25@\$1.30 for the refined material. Trading in the market for *dinitrotoluene* is limited to small lots. Supplies are of a fair volume and range in price from 25@27c. per lb. The market on *ortho-nitro-phenol* reflects a firm tone and a steady demand for supplies is heard in some directions. Available supplies are rather light and quotations range from 80@85c. per lb. Some factors report the consuming demand for *para-toluidine* of small volume. Prices are quotably unchanged at \$1.25@\$1.40 per lb. Consumers seem to be fairly well supplied with *aniline oil* for the time being and only small lots are in request at irregular intervals. Supplies are easy and while some holders

are steady in their views at 20@26c. per lb. shading is possible on a firm order.

VEGETABLE OILS

Offerings of spot *chinawood oil* were scanty and holders in some directions were asking up to 14c. per lb. on small lots. May-June-July shipments from the East were offered on the basis of 10½c. per lb. c.i.f. N. Y. No sales of round lots of *coconut oil* were reported. The Coast market for *Manila oil* closed at 8c. per lb. bid and 8½c. asked. sellers' tanks May-June shipment. For June-July contracts it was reported that 8c. could have been done on a firm bid. *Ceylon grade oil* on the spot was firm at 10½c. per lb. asked. It has just come to light that a prominent soapmaker has purchased 1,000 tons of *palm oil* for shipment from either Liverpool or Africa at purchaser's option. It was intimated that the market was shaded considerably for this deal. Several crushers of *linseed oil* moved the prices up to 73c. per gal., carlot basis. Shrewd buyers, however, could have still purchased May-June shipment at 70c. per gal. Foreign cables on linseed oil were higher, with the Dutch product advanced to 68c. per gal. c.i.f. N. Y., duty paid, May-June shipment from Rotterdam. English oil was offered at £39 per ton, prompt shipment, cooperage included.

WAXES

The market on *beeswax* was fairly steady, demand being rather quiet. African crude was generally held at 16@17c. per lb., but an occasional odd lot appeared on the market at a concession. Brazilian crude was held at 24@26c. per lb. Pure white, refined, was quoted at 40@45c. per lb. according to brand and quantity. Importations of *carnauba wax* during the past week amounted to several hundred bags. The market was irregular, offerings of spot goods having increased of late. Most of the business noted was among dealers. The No. 2 North Country was quoted on a basis of 28@30c. per lb. No. 3 North Country was held at 16@17c. per lb. Offerings of *Japan wax* for spot delivery were noted at 18@18½c. per lb. This really is the normal quotation. On forward shipments 15c. per lb. was quoted with the market barely steady. Competition in *paraffine wax* for the business pending, which was not of any large volume, resulted in further unsettlement in prices. Scale wax, 122-124 deg. melting point, was offered at 2½c. per lb., carlot basis, with the 124-126 material available at 2¾c. Match wax could have been bought at 3¼c. per lb. Refined wax of 120-122 deg. melting point was offered as low as 3½c. per lb., with the 135-137 deg. melting point held at 5½c. per lb.

The Chicago Market

CHICAGO, May 20, 1921.

Nothing of importance developed in the industrial chemical markets during the past two weeks. So far as the consuming trade was concerned purchasing, as for some time past, was confined to small quantities for early consumption and there were no important transactions reported among dealers. With supplies of many products liberal competition among sellers is keen; however, there were few changes reported in prices.

GENERAL CHEMICALS

The *caustic soda* situation lacked new features, the market being steady, with the inquiry limited to small quantities. The ground 76 per cent continued to be quoted at \$4.75@\$4.95 per 100 lb. and the solid at \$4.10 in 1-ton lots. *Soda ash* is firm and is moving in a fair way at 2¾c. per lb. *Sal soda* is also moving in a small way at 2¼c. per lb. There is a somewhat better inquiry for *aluminum sulphate*, iron free, and the price is steady at 3c. per lb. *Ammonium chloride*, white gran., is lower, single casks being offered at 8½c. There is little or no demand for *ammonium carbonate* and ample supplies are available at 11c. per lb. *Ammonium sulphate* is quiet and steady at 3½c. per lb. for ton lots. The inquiry for *formaldehyde* has dropped off somewhat and the principal dealers have reduced their prices to 15c. per lb. for barrels. *Caustic potash* is in an unsteady position and it is possible to obtain prices of a wide variation. The

88-92 per cent material is offered freely at 7½c. per lb. and it is quite possible that a lower figure could be obtained with firm business. *Potassium bichromate* is very quiet, with supplies available at 14¾@15¼c. per lb. *Sodium bichromate* is in the same position and small quantities are offered at 8¾c. per lb. Offers of *sodium nitrite* were heard as low as 7½c. for spot goods, but few sales were reported. There is a fair movement of *sodium bicarbonate* and dealers are maintaining their prices at 2½@2¾c. per lb. *Glycerine*, c.p., is in poor demand at 16¾c. per lb. and no large sales were noted. The present low price on this material should prove attractive, as it is hardly possible for it to go much lower.

The list of acids is unchanged as to prices and a better inquiry is reported from some quarters. Lower prices are predicted by some factors on *acetic acid*, 28 per cent. This article is now quoted at 2¾@3c. per lb. in barrels and the inquiry from the photographic trade is reported to be good. There is a better demand for *citric acid*, but no sales of consequence were noted and the price is unchanged at 47@48c. per lb. Requests for *sulphuric acid* were more numerous and manufacturers continue to quote \$19@\$20 per ton in tank cars f.o.b. works.

NAVAL STORES

The naval stores market has fluctuated considerably during the past two weeks and as yet shows no signs of steadiness. *Turpentine* is quoted today at 67½c. per gal. in drums and is said to be moving in a very fair way. Prices on *rosins* are very unsettled and some factors are asking as high as \$9.60 per 280 lb. for the WG grade.

COAL-TAR PRODUCTS

There is little or nothing doing in the coal-tar products branch of the trade and prices are unchanged. *Benzene* is quoted at 31c. per gal., ex-warehouse, for the 100 per cent and *toluene* is offered at the same rate. A few sales of *naphthalene flakes* were noted and the price is steady at 8½c. per lb.

The Iron and Steel Market

PITTSBURGH, May 20, 1921.

The steel trade now feels convinced that there will be no material improvement in the market in the near future, which means that there is no prospect of improvement before August, since July could not be expected to develop favorable conditions.

If demand does not improve, production of steel instead of remaining stationary will decrease, as bookings in the past week or two have not been equal to shipments. The rate of steel production in the past week has been barely 30 per cent of capacity, against an average of about 31 per cent in April, and a 25 per cent rate is not unlikely to be seen before increases begin.

On account of having a regular clientele with a large tonnage of unfilled contracts the United States Steel Corporation continues able to operate at a better rate than the independents, its percentage rate of operating, relative to capacity, being nearly double that of the independents. This is a partial offset to the lower prices the Steel Corporation accepted in 1920 as compared with the independents.

Buyers are making commitments for only very small lots, whether their commitments are in specifications against contracts, as is the case with most of the Steel Corporation business, or is in new orders, as is the case with the bulk of the current bookings of independents. Carload business is practically the rule, while orders for more than 100 tons are exceptional. Immediate shipment is usually required, which makes it that speed in delivery frequently determines where an order will go.

PRICES MAINTAINED

There are only very occasional reports of price concessions being made in finished steel products, showing that market prices are really very well maintained. In an active market concessions are not unknown, in the case of particularly desirable orders, and pass unnoticed, while in a dull market any concession is widely discussed. The

market exhibits no great degree of strength in adhering to regular prices, since incentive for cutting prices is very largely lacking, individual orders being too small to make price cutting worth while.

Of all the finished steel products, tin plate attracts the most attention on account of presenting a dull market, because tin plate has been in fairly good demand every year, not feeling industrial depressions like steel products that figure largely in construction work. Until 1919 the production of tin plate never fell in any year more than 16 per cent below the previous high record, but 1921 is now certain to show a spectacular decline. At this time in the year demand for the shipment of tin plate has always been very active, but now the tin mills are not operating at more than about 30 per cent of capacity and there are large stocks at mills, not moving to any extent. Some of the stock is tin plate made up against orders of consumers, the consumers not being willing to accept delivery as yet. For production tin plate the regular price of \$6.25 is maintained, but odd lots out of stock can be had at \$6 or less.

The pipe mills present the appearance of being decidedly busier than other departments of the finished steel trade, the average of operations being above 50 per cent, but the condition is largely explained in the fact that pipe-making capacity has increased less in the past few years than steel capacity in general.

READJUSTMENT PROCEEDING

For some time past the steel trade has been convinced that the chief deterrent to business activity has been the labor situation, both the failure of wages in many lines of activity to decline to a safe level and the unwillingness of workmen in the building trades to give a fair day's service. Building activity is regarded as impossible in the circumstances. Accordingly the steel trade has been particularly pleased by the announcement of the Railroad Labor Board this week that a reduction in wages of railroad labor is justified by conditions. The steel trade had felt that a reduction in railroad wages would be helpful in three respects: It would eventually give the railroads some spare money out of their receipts, it would improve railroad credit and it would have a favorable sentimental influence upon workmen in other lines whose wages should be reduced to put industry on a safe basis.

PIG IRON AND COKE

The pig iron market continues dull and listless. The local market remains at \$24 for bessemer, \$22 for basic and \$23.50 for foundry f.o.b. valley furnaces, with \$1.96 freight to Pittsburgh.

As nearly all the merchant furnaces are out of blast, the pig iron now being offered in the market is chiefly iron from producers' stocks, and prices are far below the actual production cost of such iron. The coke market has declined and while 1921 season prices for ore have not been developed it is established that there will be a heavy reduction from the 1920 schedule. Wages at blast furnaces have been reduced. Counting instead of the actual cost of the pig iron now offered its replacement cost, it is a question whether the iron is offered below cost. The actual experience of a valley furnace interest shows that in 1913 the total freight cost of assembling the raw materials necessary to make a ton of pig iron was \$5.33, while the cost after the rate advance of Aug. 26, 1920, was \$9.82. This is actual furnace experience, and there was a reduction in the quantity of coke consumed, so that if the 1920 quantity of coke were taken for 1913 the assembling cost would have been 25c. less. Thus the increase caused by freight rate advances on the cost of producing a ton of pig iron is \$4.74. This does not take account of the charge now imposed for slag wasting, necessary for most furnaces, so that the total increase may be set conservatively at \$5 for a valley furnace. For several years before the war the lowest market price of basic pig iron at valley furnaces was \$12.25. To get an equally low price under present conditions \$5 should be added for freights and allowances made for higher wage rates in coke making, limestone quarrying, ore mining and furnace operation. Connellsville coke is now \$3.25.

Monochlorobenzene..... lb.	.12 — .14
Monomethylaniline..... lb.	1.75 — 1.85
Naphthalene crushed, in bbls (250 lb.)..... lb.	.07 — .08
Naphthalene, flake..... lb.	.07 — .08
Naphthalene, balls..... lb.	.08 — .09
Naphthionic acid, crude..... lb.	.70 — .75
Nitrobenzene..... lb.	.12 — .15
Nitronaphthalene..... lb.	.30 — .35
Nitro-toluene..... lb.	.16 — .18
Ortho-amidophenol..... lb.	3.15 — 3.40
Ortho-dichlorobenzene..... lb.	.15 — .20
Ortho-nitro-phenol..... lb.	.80 — .85
Ortho-nitro-toluene..... lb.	.15 — .20
Ortho-toluidine..... lb.	.20 — .25
Para-amidophenol, base..... lb.	1.50 — 1.60
Para-amidophenol, HCl..... lb.	1.75 — 1.80

Para-dichlorobenzene..... lb.	.15 — .20
Paranitroaniline..... lb.	.90 — 1.00
Para-nitrotoluene..... lb.	.90 — 1.00
Para-phenylenediamine..... lb.	1.95 — 2.00
Para-toluidine..... lb.	1.25 — 1.40
Phthalic anhydride..... lb.	.50 — .60
Phenol, U. S. P., drums (dest.), (240 lb.)..... lb.	.12 — .14
Pyridine..... gal.	2.00 — 3.50
Resorcinol, technical..... lb.	1.75 — 1.85
Resorcinol, pure..... lb.	2.25 — 2.30
Salicylic acid, tech., in bbls. (110 lb.)..... lb.	.21 — .23
Salicylic acid, U. S. P..... lb.	.22 — .24
Salol..... lb.	.85 — .95
Solvent naphtha, water-white, in drums, 100 gal..... gal.	.25 — .28
Solvent naphtha, crude, heavy, in drums, 100 gal..... gal.	.14 — .16
Sulphanilic acid, crude..... lb.	.30 — .35
Tolidine..... lb.	1.25 — 1.35
Toluidine, mixed..... lb.	.40 — .45
Toluene, in tank cars..... gal.	.25 — .28
Toluene, in drums..... gal.	.28 — .31
Xylidines, drums, 100 gal..... lb.	.40 — .45
Xylene, pure, in drums..... gal.	.40 — .45
Xylene, pure, in tank cars..... gal.	.45 — .45
Xylene, commercial, in drums, 100 gal..... gal.	.33 — .35
Xylene, commercial, in tank cars..... gal.	.30 — .35

Waxes

Prices based on original packages in large quantities.

Beeswax, refined, dark..... lb.	\$0.23 — \$0.25
Beeswax, refined, light..... lb.	.25 — .27
Beeswax, white pure..... lb.	.45 — .47
Carnauba, Florida..... lb.	.61 — .62
Carnauba, No. 2, North Country..... lb.	.28 — .30
Carnauba, No. 3, North Country..... lb.	.16 — .17
Japan..... lb.	.18 — .18
Montan, crude..... lb.	.07 — .08
Paraffine waxes, crude match wax (white) 105-110 m.p..... lb.	.03 — .03
Paraffine waxes, crude, scale 124-126 m.p..... lb.	.02 — .02
Paraffine waxes, refined, 118-120 m.p..... lb.	.03 — .03
Paraffine waxes, refined, 125 m.p..... lb.	.04 — .04
Paraffine waxes, refined, 128-130 m.p..... lb.	.04 — .05
Paraffine waxes, refined, 133-135 m.p..... lb.	.05 — .05
Paraffine waxes, refined, 135-137 m.p..... lb.	.05 — .06
Stearic acid, single pressed..... lb.	.09 — .09
Stearic acid, double pressed..... lb.	.10 — .10
Stearic acid, triple pressed..... lb.	.11 — .11

Naval Stores

All prices are f.o.b. New York unless otherwise stated, and are based on carload lots. The oils in 50-gal. bbls., gross weight, 500 lb.

Rosin B-D, bbl..... 280 lb.	\$5 20 —

Industrial

Financial, Construction and Manufacturers' News

Construction and Operation

Alabama

ANNISTON—The Poland Soap Works, recently organized, is arranging for a lease of a local building for the establishment of a new plant for the manufacture of soap and soap powders in bulk. It is proposed to develop an annual capacity of about 3,000,000 lb. of material. Carter D. Poland is president, and O. L. Williams secretary-treasurer.

MOBILE—W. A. Benson and associates are organizing a company for the establishment of a new local plant for the manufacture of paints, varnishes, etc. A building has been acquired and machinery will be installed at once. The initial output will be on the basis of about 2,000 gal. per day.

Arkansas

TEXARKANA—H. K. Tutty, New Orleans, La., and associates are organizing a company to establish a local pulp mill.

Arizona

BISBEE—The new ore reduction mill, now in course of construction at the property of the Copper Queen Mining Co., is estimated to cost close to \$4,000,000 with machinery and equipment. It will be one of the largest plants of its kind in the country.

PRESCOTT—The Big Ledge Copper Co. is arranging for a stock issue to total about \$500,000, the proceeds to be used for general operations and financing.

California

LOS ANGELES—The National Airless Tire Co., Grosse Bldg., manufacturer of rubber tires, has preliminary plans under way for the erection of a new 3-story plant at Norwalk, Cal., 100x250 ft. A. C. Martin, 430 Higgins Bldg., is architect. C. H. Braden is secretary and general manager.

SAN FRANCISCO—The Pacific Coast Steel Co., Rialto Bldg., is having plans prepared for the erection of a new 1-story plant at South San Francisco to be 80x400 ft.

BURBANK—The Crystal & Colored Glass Co. has awarded a contract to W. Lee Ray, Burbank, for the erection of a new 1-story plant, 70x130 ft., at First and Cypress Sts.

SAN MATEO—The Minerals, Metals & By-Products Co., Denver, Col., has selected property owned by the Howard Estate Co., on the San Mateo Bay shore, comprising about 1,385 acres of land, as a site for the erection of its proposed new metallurgical plant. Present submerged land on the tract will be reclaimed. The new works are estimated to cost in excess of \$1,000,000 with machinery. L. C. Rogers is president.

Florida

CANAL POINT—The Florida Sugar & Food Products Co. is planning for the erection of a large sugar mill on a local tract of land. The company has an aggregate of 8,000 acres of land. The new plant will have an initial capacity for handling about 5,000 tons of sugar cane per month. F. E. Bryant is head.

Illinois

CHICAGO—The Waterway Paper Co., Kedzie Ave. and 32d St., has plans under way for the erection of a new 1-story plant on Kedzie Ave., 80x180 ft., estimated to cost about \$175,000. Frank D. Chase, Inc., 645 North Michigan Ave., is engineer.

CHICAGO—The Atlas Copper & Brass Mfg. Co., 2734 High St., is taking bids for the construction of a new 1-story plant addition, 50x125 ft., to cost about \$21,000. Louis Ehle, 3810 B'way, is architect.

Indiana

SOUTH BEND—The International India Rubber Corp., 310 West Ewing Ave., has

had plans prepared for the erection of a 2-story and basement addition to its plant. W. W. Schneider, 120 South Main St., is architect.

Maryland

BALTIMORE—The Holdtite Mfg. Co. has taken out a building permit for the erection of a new 1-story plant, 50x132 ft., for the manufacture of rubber specialties. It will be located at Warner and Ostend Sts. Stanislaus Russell, 11 East Lexington St., is architect.

BALTIMORE—Plans for the new plant of the Gwynns Falls Paper Co., 517 Calvert Bldg., have been completed and it is expected to call for erection bids at an early date. The plant will be located at Gwynns Falls, near Baltimore; it will be 1-story, brick and concrete, and estimated to cost about \$250,000 with machinery. Joseph H. Wallace & Co., 5 Beekman St., New York, are engineers. George W. Davis is head.

BELLEVUE, MD.—William H. Valliant is reported to be planning for the rebuilding of his fertilizer manufacturing plant and lime works, destroyed by fire May 10, with loss estimated at about \$250,000 with machinery.

BALTIMORE—Swindell Bros., Bayard and Russell Sts., manufacturers of glass products, have acquired property on Russell St., 100x165 ft., in the vicinity of their plant, to be used in connection with general operations. It is said that a new building will be located on the site, but this has not been confirmed.

Massachusetts

TAUNTON—The Presbrey Stove Lining Co., Wier Village, manufacturer of refractory products, has awarded a contract to Franklin D. Williams, Taunton, for the erection of a new 2-story plant building to cost about \$25,000. It will replace a portion of the works recently destroyed by fire with loss of about \$125,000.

Missouri

KANSAS CITY—A. W. Estrabrook, 729 Holmes St., has broken ground for the erection of a new 2-story and basement chemical laboratory and manufacturing works on Holmes St., 40x60 ft. William Jewell, 417 Rialto Bldg., has the construction contract.

ST. LOUIS—The Herman Oak Leather Co., 4020 North Main St., has awarded a contract to Arthur Dorr, 4145 Manchester Ave., for the construction of the proposed 2-story and basement addition to its plant, 24x70 ft., to cost about \$25,000. L. C. Herman is head.

New Jersey

TRENTON—The Magnetic Pigment Co., Cass St., will make extensions and improvements in its plant to cost about \$12,000.

TRENTON—The Star Porcelain Co., Muirheid Ave., has filed plans for the erection of a new 1-story plant addition.

NEWARK—The Interstate Smelting & Refining Co., 29 Commercial St., has acquired property at Hawkins St. and Plum Point Lane for proposed future additions to its plant. Erection of proposed buildings will be deferred, it is said, for a few months.

VINELAND—The Doerr Glass Co., manufacturer of chemical and scientific glassware specialties, has completed the erection of additions to its plant to be used for the manufacture of glass tubing, rods and kindred articles.

LYNDHURST—The Butterworth-Judson Co., Newark, N. J., manufacture of chemicals, dyestuffs, etc., has disposed of its local plant to the Goodwin Reid Co., also of Newark, which will use the works, it is said, for kindred manufacture. The property consists of buildings aggregating about 20,000 sq. ft. in floor area, located on a two-acre tract. The plant at one time was occupied by the Renslau Chemical Co.

NEWARK—The National Cork Products, Inc., recently organized, has leased the 2-story factory at 357-9 Ogden St., near Carlyle Pl., for the establishment of a new plant for the manufacture of cork special-

ties. Possession will be taken at once and necessary equipment installed. D. D. Lehrman is vice-president.

New York

BROOKLYN—The J. Lackner Co., 308 Seventh Ave., manufacturer of paper specialties, has revised plans under way for the erection of a 2-story addition to its plant, 85x97 ft., to cost about \$19,000.

NEW YORK—The Standard Oil Co., 26 B'way, has arranged for a bond issue of \$20,000,000 to be used in part for extensions to its oil refineries, and general operations. The company operates a large refinery at Constable Hook, Bayonne, N. J.

BUFFALO—The Williams Gold Refining Co., 2978 Main St., has awarded a contract to the Hydro Construction Co., Mutual Life Bldg., for the erection of a 1-story addition, 50x63 ft., to be used for general manufacture. It will cost about \$15,000. R. V. Williams is treasurer.

North Carolina

SALISBURY—The Paul Rubber Co., recently incorporated with a capital of \$250,000, has plans under way for the erection of the first unit of its proposed new local plant for the manufacture of tires, to be 2-story, 60x160 ft., with 1-story building adjoining, 60x100 ft., estimated to cost about \$35,000. The company has a tract of 7½ acres of land, and the initial buildings will be supplemented by other structures at a later date. W. H. McConnell is head.

Ohio

CLEVELAND—The Hinde Paper Co., recently organized with a capital of \$1,000,000, is planning for the erection of a new local plant for the manufacture of fiber board products. The company is headed by James J. Hinde, one of the founders of the Hinde & Dauch Paper Co., Sandusky, Ohio, manufacturer of corrugated paper specialties.

Oklahoma

GRANFIELD—The Motor Oil & Refining Co., recently organized, is planning for the erection of a new oil refinery at Chickasha, Okla., with initial daily capacity of 500 bbl. of crude oil. It is proposed to build a compounding works, adjacent to the main refinery, for the production of lubricating oils. R. C. Williamson is president, and R. R. Ryule secretary and treasurer.

Pennsylvania

DU BOIS—The Independent Sanitary Mfg. Co., 218 Lexington Ave., Buffalo, N. Y., manufacturer of sanitary metal products, has plans under way for the erection of a new foundry on a local site. Cundall, Powell & Mosher, 80 West Genesee St., Buffalo, are architects.

YORK—Fire May 12 destroyed a portion of the plant of the American Phosphorous Co., with loss reported at about \$12,000.

PHILADELPHIA—The Federal Container Co., 25th and Locust Sts., manufacturer corrugated paper containers, etc., has acquired property on Paschall Ave., near 56th St., 130x325 ft., for the erection of its proposed new 2-story plant, 82x302 ft., estimated to cost about \$150,000 with equipment.

Tennessee

CLEVELAND—The Kyva Ferro-Manganese Corp., Winchester, Ky., has acquired the electric furnace plant of the Tennessee Manganese Co., Cleveland, with daily capacity of about 10 tons, and will operate the plant in connection with its manganese property developments in this section. The plant will be used for the production of ferromanganese, ferrosilicon and kindred products. W. B. Lindsay is president.

Texas

TEXARKANA—The Diamond Sugar Chemical Co., recently organized, has leased a local building for the immediate establishment of a new plant for the manufacture of chemical specialties. Machinery, including laboratory equipment, will be installed. Clifton T. Spear, Box 378, is president and manager.

BRIDGEPORT—The Phoenix Clay Corp. has inaugurated the erection of a new plant for the manufacture of brick and other burned clay products. The company is reported to have acquired the plant of the Bridgeport Brick & Tile Co., and with this acquisition will develop a total daily output of over 125,000 bricks. C. W. Martin is president.

West Virginia

FAIRMONT—The Federal Carbonic Co. has perfected plans for the erection of a new local plant for the production of carbonic acid gas and kindred products. E. A. Bailey is president.

Capital Increases, Etc.

THE ELLISON BRASS MFG. Co., Jamestown, N. Y., has filed notice of increase in capital from \$60,000 to \$250,000.

THE MARTIN VARNISH Co., 2520 Quarry St., Chicago, has filed notice of increase in capital from \$100,000 to \$250,000.

THE HOUSTON PAPER Co., Houston, Tex., has filed notice of increase in capital from \$30,000 to \$50,000.

THE WILLIAMS SUBMARINE COMPOUND Co., 21 State St., New York City, has filed notice of change of name to the Williams Scaling & Paint Co.

THE DE LUXE INK & DYE Co., Chicago, has filed notice of increase in capital from \$40,000 to \$400,000.

THE RELIANCE FOUNDRY Co., Richmond, Ind., has filed notice of increase in capital from \$30,000 to \$60,000.

THE CONNECTICUT ZINC CORP., Wyandank (Suffolk Co.), N. Y., has filed notice of increase in capital from \$1,000,000 to \$2,000,000.

THE MILLER-LAMBERT CHEMICAL Co., Columbia, S. C., is arranging for an increase in capital to \$25,000. Mayhew Lambert is president.

THE PINES RUBBER Co., Brooklyn, N. Y., has filed notice of increase in capital from \$75,000 to \$200,000.

New Companies

THE NATIONAL ZYLONOID Co., New York City, has been incorporated with a capital of \$500,000 to manufacture celluloid and other composition products. The incorporators are C. H. Louis, M. Dulugasch and W. Polglass. The company is represented by Olcott, Bonyng, McManus & Ernest, 170 B'way.

THE CONSOLIDATED SALT Co. OF CALIFORNIA, Los Angeles, Cal., has been incorporated with a capital of \$750,000 to manufacture salt products, industrial chemicals, etc. The incorporators are Alfred G. Blair, Samuel Merrill, Jr., Pasadena, Cal.; John Coolman, F. H. Owen, Colton, Cal. Manning & Thompson, Los Angeles, represent the company.

THE AETNA CHEMICAL Co., Boston, Mass., has been incorporated with a capital of \$200,000 to manufacture chemical products. Walter F. Clarke is president, and Robert Thompson, 228 Huntington Ave., treasurer.

THE FURNACE LINING MATERIALS Co., 53 West Jackson Blvd., Chicago, has been incorporated with a capital of \$50,000 to manufacture refractory products. The incorporators are C. L. Leesley, F. C. Corley and W. D. Sheperd.

THE EVERFIRE SPARK PLUG Co., New York, has been incorporated with a capital of \$25,000 to manufacture spark plugs, etc. The incorporators are R. and A. Lyons, and J. Hirschman. Hirschman & Roeder, 1475 B'way, represent the company.

THE KELSEY CITY BRICK & SUPPLY Co., Kelsey City, Fla., has been incorporated with a capital of \$500,000 to manufacture brick and other burned clay products. Harry S. Kelsey is president, Fred A. Clarry vice-president and secretary, and James McDonald treasurer.

THE HURST OIL Co., Los Angeles, Cal., has been incorporated with a capital of \$5,000,000 to manufacture petroleum products. The incorporators are J. T. Hurst, Jerome B. Frank and S. M. Haskins. Gibson, Dunn & Crutcher, Los Angeles, represent the company.

THE MAGIC DYE-SOAP Co., 75-77 West Van Buren St., Chicago, has been incorporated with a capital of \$100,000 to manufacture soaps and affiliated products. The incorporators are Robert B. Whiting, T. N. Daggert and M. A. Jeffers.

THE MAXWELL CHEMICAL Co., Dallas, Tex., has been incorporated with a capital of \$25,000 to manufacture chemicals and chemical byproducts. The incorporators are P. P. Roberg and Henry Exall.

THE CONTINENTAL LEATHER GOODS Co., Newark, N. J., has been incorporated with a capital of \$100,000 to manufacture leather products. The incorporators are Max Olsham, Irving Wexler and Louis J. Cohen, 207 Broad St.

THE WILSON SPECIALTY Co., New York City, has been incorporated with a capital of \$100,000 to manufacture chemicals and chemical compounds. The incorporators are W. Wilson, S. Senate and J. J. Kraus. L. I. Isquith, 299 B'way, represents the company.

THE STANDARD RUBBER CEMENT Co., Stoughton, Mass., has been incorporated with a capital of \$10,000 to manufacture rubber cement and kindred products. The incorporators are M. S. Azulay, E. M. Azulay and J. C. Eccles.

THE SUPERIOR GLASS APPARATUS Co., 6 Van Wagenen Ave., Newark, N. J., has filed notice of organization to manufacture chemical glassware. Emil Sella, 288 Broad St., heads the company.

THE PLACERITA PETROLEUM Co., Los Angeles, Cal., has been incorporated with a capital of \$500,000 to manufacture petroleum products. The incorporators are John K. McGregor, W. J. Van Houten and Amos Campbell. George R. Wickham, Hermosa Beach, Cal., represents the company.

THE ONE-Co. VARNISH WORKS, New York City, has been incorporated with a capital of \$20,000 to manufacture paints, oils, varnishes, etc. The incorporators are N. and S. Kent and S. Blumenthal. Kent & Kent, 287 B'way, represent the company.

THE SHULTZ MFG. Co., Binghamton, N. Y., has been incorporated with a capital of \$75,000 to manufacture paper and paper products. The incorporators are J. F. Murphy, J. B. Rushmore and A. J. Prie, 4 East Howard St.

THE STAZON MFG CORP., Brooklyn, N. Y., has been incorporated with a capital of \$5,000 to manufacture cleaning products, chemical compounds, etc. The incorporators are B. H. Fry, M. L. Einstein, Stern & Reubens, 149 B'way., represent the company.

THE HERIOT LIME Co., Birmingham, Ala., has been organized to manufacture hydrated lime and other lime products. The company is headed by W. B. Heriot and J. S. Bailey.

THE WENGER-ARMSTRONG CORP., 608 South Dearborn St., Chicago, has been incorporated with a capital of \$50,000 to manufacture petroleum and petroleum byproducts. The incorporators are Ernest A. Wenger, Archer S. Armstrong and Edward R. Tiedebohl.

THE BRADLEY MOTOR OIL Co., New York City, has been incorporated with a capital of \$20,000 to manufacture refined oil products. The incorporators are H. A. Bradley, L. Wienecke and S. Root. I. Witkind, 299 B'way, represents the company.

THE AMARILLO PAPER Co., Amarillo, Tex., has been incorporated with a capital of \$20,000 to manufacture paper products. The incorporators are Benjamin Hirschland and J. S. McKnight.

THE BLYTHE CHEMICAL Co., Brooklyn, N. Y., has been incorporated with a capital of \$5,000 to manufacture chemicals and chemical byproducts. The incorporators are A. Falk, K. Hart and D. Geiger, 286 Fifth Ave.

THE GECK LABORATORIES, INC., New York City, has been incorporated with a capital of \$20,000 to manufacture chemicals and chemical byproducts. The incorporators are F. A. Geck, J. S. Scheuer and H. H. Jacobs. Joseph & Zeamans, 1834 B'way, represent the company.

THE PENN PAPER Co., Erie, Pa., has been incorporated with a capital of \$50,000 to manufacture paper products. John F. Young, 604 East 21st St., is treasurer.

THE MARYLAND OIL Co., 16 St. Paul St., Baltimore, Md., has been incorporated with a capital of \$250,000 to manufacture refined oil products. The incorporators are William B. Henkel, Wirt A. Duvall, Jr., and M. P. Kenly.

THE HUNTINGTON-MAIN OIL Co., Los Angeles, Cal., has been incorporated with a capital of \$300,000 to manufacture petroleum products. The incorporators are Torrance C. Welch, Pasadena, Cal.; C. C. Dicey and H. M. Farris, Los Angeles.

THE T. G. EGAN REFRACTORY ENGINEERING Co., Brooklyn, N. Y., has been incorporated with a capital of \$10,000 to manufacture refractory products. The incorporators are T. G. Egan, I. P. Morris and M. H. Lewis. H. S. Dudner, 11 B'way, represents the company.

THE BIG X OIL CORP., Bigheart, Okla., has been incorporated with a capital of \$100,000 to manufacture petroleum products. The incorporators are E. B. Gray and E. M. Coffey, Bigheart.

THE LA ESTRELLA CASTILE SOAP Co., New York, N. Y., has been incorporated with a capital of \$5,000 to manufacture soap and kindred products. The incorporators are G. Korn, A. P. Fernandez and M. M. Simon, 805 B'way.

THE PLANIA CARBON CORPORATION, 26 West Randolph St., Chicago, has been incorporated with a capital of \$100,000 to manufacture carbon products. The incorporators are Fred W. Hartmann, George H. Webster and William R. Darnall.

THE INTERNATIONAL CORRUGATED BOX Co., New York City, has been incorporated with a capital of \$15,000 to manufacture corrugated paper products. The incorporators are S. and D. Honigstock, and A. I. Menin, 1 Madison Ave.

THE AUTO PAINT Co., Newark, N. J., has been incorporated with a capital of \$50,000 to manufacture paints, varnishes, etc. The incorporators are George W. Nuse, Maurice R. H. Bowman and David J. Hall, Newark.

THE MINERAL PAINT MFG. Co., Los Angeles, Cal., has filed notice of organization to manufacture paints, oils, etc. Frank L. Buchanan, East 55th St., heads the company.

THE CANYON PETROLEUM Co., Room 1208, 36 South State St., Chicago, Ill., has been incorporated with a capital of \$1,000,000 to manufacture petroleum products. The incorporators are John Kabany, George D. Leonard and H. M. Meyers.

THE STANDARDIZED CHEMICAL Co., Room 1330, 122 South Michigan Ave., Chicago, has been incorporated with a capital of \$25,000 to manufacture chemicals and chemical byproducts. The incorporators are E. Craig, Frank F. Perner and Joseph H. Hazen.

Manufacturers' Catalogs

GENERAL MACHINE Co., Newark, N. J., has issued a booklet on Ball Thrust Bearing Overhung Agitating Devices and Chemical Equipment.

THE DE LA VERGNE MACHINE Co., New York, calls attention to three new publications, on Municipal Power Plants, De La Vergne Oil Engineer, Type SI, and The De La Vergne Diesel Oil Engine.

THE ELECTRIC FURNACE Co., Salem, O., has issued a book of photographs of Bailey electric furnaces in brass foundries and rolling mills in the United States and also in foreign countries, which is known as Booklet 10-B.

THE SULLIVAN MACHINERY Co., Chicago, Ill., announces three new publications. Bulletin 72-E, on Drill Sharpening Machines, describes the new Class B light weight drill sharpener, as well as the standard Class A machines, with especial references to the making of genuine double taper bits, etc. Bulletin 77-B, on Angle Compound Air Compressors, includes mention of the company's single stage or duplex angle machines for low pressure. Bulletin 77-A illustrates Sullivan mine car compressors, which are operated by electric motor.

THE FILES ENGINEERING Co., INC., Providence, R. I., has issued a booklet entitled "Files Stoker" which describes a hand-operated stoker and gives some interesting data regarding the stoker and efficient fuel burning.

THE NORTON Co., Worcester, Mass., has issued a booklet on "Grinding in the Railroad Shops."

W. S. ROCKWELL Co., New York, calls attention to Bulletin 223, which illustrates and describes various types of burners for the use of oil and gas fuel for industrial heating. Bulletin 224 is on "Form Value of Energy in Relation to Its Production, Transportation and Application."

THE MAHR MFG. Co., Minneapolis, Minn., has issued sheet 523, describing a style "T" self-contained kerosene torch for use in foundry and machine shops and chemical plants.

THE VIDETTO-RUANE MACHINERY Co., Pittsburgh, Pa., recently issued a new bulletin covering portable belt conveyors. These conveyors are known as the Atlas brand and range in size from 18 to 24 in. belt width. They are used for loading and unloading box cars and gondolas and for piling various materials in and about the plant. They may be driven by gasoline engine or electric motors and are equipped with a swivel axle for placing the wheels in any position in regard to the direction of travel of the belt.

THE PITTSBURGH REINFORCED BRAZING & MACHINE Co., Pittsburgh, Pa., has published a circular on its new high-pressure oxygen compressor which has just been placed on the market. It is illustrated in front and side view.

THE AMERICAN ENGINEERING Co., Philadelphia, Pa., is distributing a pamphlet entitled "Are Mechanical Stokers a Good Investment?" Interesting pen and ink illustrations are given.

FULLER-LEHIGH Co., Fullerton, Pa., calls attention to Catalog 700, on "Fuller Pulverized Coal Equipment for Locomotives." This booklet illustrates and describes pulverized coal-burning equipment which is the result of six years of trial, research and development, together with sixteen years' experience in design and application.

HENRY VOGT MACHINE Co., Louisville, Ky., has published a booklet on "Vogt for Better Refinery Equipment." The Vogt paraffine wax plant equipment is briefly outlined, and illustrations and descriptive matter are given of other Vogt equipment, including chilling machine, refrigerating machine, paraffine wax press, auto truck tank, water tube boiler, horizontal return tubular boiler, sectional steel boiler casing, stills for oil refineries, drop forged steel valves and fittings, and sectional shaking and dumping grates. Copies will be sent upon request.

THE CHICAGO FLEXIBLE SHAFT Co., Chicago, Ill., has issued Catalog 80, on "Stewart Porcelain Enameling Furnaces." This catalog describes porcelain enameling methods and furnace construction, from both the metallurgical and the practical shop standpoint, and is a compilation of exceptionally useful information. Many interesting illustrations are given.

THE TERMINAL ENGINEERING Co., INC., New York, calls attention to Publication R229. It contains a description of a truck which can handle the problems of short haul transportation in a new way. It is a combined outdoor and indoor machine, permitting the haulage of goods from any floor of any building to any floor of any other building within reasonable distance. Loads are carried on separate platforms, eliminating loading and unloading delays.

THE WHEELER CONDENSER & ENGINEERING Co., Carteret, N. H., has issued Bulletin 114, on "The Lillie Evaporator," which is for waste waters and solutions generally. In this bulletin are described in considerable detail the features peculiar to the Lillie evaporator and several installations for sugar work, distilling water, and for evaporating many kinds of chemicals, solutions and waste waters. A perspective diagram is also given of the triple-effect and auxiliaries recently installed at the power station of the Chile Exploration Co., Tocopilla, Chile. A copy will be sent to responsible persons upon application.

THE P. H. & F. M. ROOTS Co., Connersville, Ind., has issued a folder on "Gas Exhausters and Boosters."

THE READING IRON Co., Reading, Pa., has issued Bulletin 2, in which is described the structural differences between wrought iron and steel and their relation to the field of welded pipe. It is written in a style that will interest the layman as well as the engineer.

THE BRITISH ALUMINUM Co., New York City, has published an interesting booklet on "The Casting of Aluminum."

C. B. ROBERTS ENGINEERING Co., Boston, Mass., has issued an attractive catalog entitled "A Modern Refinery," which is well illustrated.

THE LANCASTER IRON WORKS, INC., Lancaster, Pa., has issued a bulletin on steel plate construction.

THE J. G. WHITE ENGINEERING CORP., New York City, is distributing a folder entitled "Achievement." It gives information about and illustrations of power developments, hydro-electric developments, transmission systems and other important engineering projects in this and in foreign countries.

THE BACHARACH INDUSTRIAL INSTRUMENT Co., Pittsburgh, Pa., has issued a folder which shows its new quarters at Pittsburgh, Pa. The products of the company are given in a two-page folder and consist mainly of gas meters, air meters, pressure recorders, draft recorders, Pitot tubes and orifices, CO₂ indicators, manometers and engine indicators. Manometers and engine indicators are new products and are described in pamphlets G and M. The manometers may be arranged for their pressure, draft or differential pressure. The engine indicator described in pamphlet M may be furnished for revolutions up to 1,500 per minute.

THE MONO CORP. OF AMERICA, New York City, calls attention to a new departure in combustion control devices which is described in an illustrated bulletin, called the Duplex Mono, which is unique in that it automatically analyzes and records the combined percentages of three combustible

gases (CO, CH₄, H₂) during all such times as any or all of these appear in the flue, while it also produces a continuous record of the percentage of CO₂. Both records are on one chart.

HARRIS BROS. Co., Savannah, Ga., and Chicago, Ill., call attention to two bulletins. Bull. NS-1 gives a list of machinery, equipment and supplies which the company has purchased from the National Shipbuilding & Dry Dock Co., while Bull. 505, entitled "Water Tube Boilers," illustrates and describes new boilers which have been purchased from the Government and which were built under rigid Government inspection.

THE COMBUSTION ENGINEERING CORP., New York, has issued an attractive catalog, Bulletin C2, on the Coxe Stoker. This catalog is a revised edition of the old Coxe stoker catalog with supplementary text and revised line drawings.

THE POWER SPECIALTY Co., New York, which has been conducting an investigation into the requirements of oil-heating apparatus in refinery work, with a view to developing a more efficient type of still, has published the results of its investigation in a forty-page bulletin, in which is included descriptions of oil-heating apparatus, drawings of installations, a discussion of the flow of fluids in pipe lines and curves, tables and other data of interest to refinery engineers and superintendents.

JOSEPH T. RYERSON & SONS, Chicago, Ill., has issued a 96-page book on the heat treatment of alloy steels, entitled "The Ryerson Handbook on Alloy Steels." This book, written in an interesting non-technical style by G. VanDyke, manager of the alloy steel department, includes chapters on quality, method of manufacture, elements and the part they play, how to buy and select alloy steels, shop equipment, furnaces, quenching equipment, heat measurement, heating, cooling and quenching, drawing, annealing, testing heat-treated steel, case-hardening or carbonizing and general remarks, together with pen and ink sketches. The book will be sent upon request to buyers and users of alloy steel.

THE WHITE Co., Cleveland, O., announces a new publication entitled "White Trucks in the Oil Industry," which gives in 50 pages pictures and stories illustrative of the prominent part motor trucks are taking today in the development of the oil industry.

THE QUIGLEY FURNACE SPECIALTIES Co., New York City, has published a 16-page booklet on Q-alloys.

New Publications

OUR NEW PLACE IN WORLD TRADE is the title of a booklet recently published by the Guaranty Trust Co. of New York City.

RAW WATER DISTILLING PLANTS FOR PRODUCING DISTILLED BOILER FEED MAKE-UP WATER, by Joseph Price. Compliments of the Griscom-Russell Co., New York.

REPORT OF ACTIVITIES OF THE DIVISION OF INDUSTRIAL HYGIENE AND ENGINEERING for 1918 and 1919, published by the Dept. of Labor and Industry, Harrisburg, Pa.

UN SOUNDNESS IN STEEL AND FUNDAMENTALS ESSENTIAL TO SOUNDNESS, with appendix on Ingots and Ingot Molds, by Emil Gathmann and George Dornin, and published by the Gathmann Engineering Co.

COMMERCIAL POSSIBILITIES OF THE UNION OF SOUTH AFRICA. A survey of the recent industrial expansion and the mineral and agricultural resources of a market presenting great possibilities for American enterprise. Issued by the National Foreign Trade Council, India House, Hanover Sq., New York City. Copies will be sent free upon application to O. K. Davis, secretary.

PLATINUM is the title of a publication recently issued by the South American Gold & Platinum Co., New York and Buenaventura, Colombia.

RAIL REPORTS, which is Bulletin 9, has been published and sent with the compliments of the Titanium Alloy Manufacturing Co., Niagara Falls, N. Y.

OVERHEAD EXPENSES—HOW TO DISTRIBUTE THEM IN GOOD AND BAD TIMES, published by the Fabricated Production Department, Chamber of Commerce of the U. S.

REPORT ON CORROSIVE ACTION AND NATURE OF PRODUCTS FORMED WHEN CARBON TETRACHLORIDE EXTINGUISHER LIQUIDS ARE APPLIED TO FIRES. Published by the Underwriters' Laboratories, Chicago, Ill.

MESABI SINTER, PLANT, PROCESS AND PRODUCT OF THE MESABI IRON Co., Babbitt, Minn. Compliments of Clement K. Quinn & Co., Duluth, Minn.

PAPERMAKING MATERIALS. Reprinted from the *Paper Trade Journal* by Arthur D. Little, Inc., Cambridge, Mass.

U. S. TARIFF COMMISSION PUBLICATION: Suggested Reclassification of Chemicals, Oils and Paints. A report to Congress suggesting a reclassification of Schedule A and of related provisions of the Tariff Act of Oct. 3, 1913.

COAL-TAR DYES, for which import licenses were granted during the fiscal year 1920, by Charles S. Hawes. Published by the U. S. Department of State, War Trade Board Section, Washington, D. C.

CHROMIUM ORE, by W. G. Rumbold, published by the Scientific and Technical Department, Imperial Institute, London, England.

ANTIMONY. Published by the Imperial Mineral Resources Bureau, London.

ALUMINUM AND BAUXITE. Published by the Imperial Mineral Resources Bureau, London.

COBALT. Published by the Imperial Mineral Resources Bureau, London.

ZINC. Published by the Imperial Mineral Resources Bureau, London.

Coming Meetings and Events

AMERICAN CHEMICAL SOCIETY will hold a meeting at Rumford Hall, Chemists' Club, New York City, on June 10.

AMERICAN CHEMICAL SOCIETY, THE SOCIETY OF CHEMICAL INDUSTRY and the American Section of the latter society will hold a joint meeting in New York, Sept. 6 to 10.

AMERICAN ELECTROCHEMICAL SOCIETY will hold its fall meeting in Lake Placid, N. Y., Sept. 29 and 30, and Oct. 1.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS will hold its spring meeting June 20 to 24 at Detroit. Industrial excursions will be made to Ann Arbor, Saginaw, Midland and Bay City.

AMERICAN IRON AND STEEL INSTITUTE will hold its nineteenth general meeting in the Hotel Commodore, New York, on Friday, May 27. There will be three sessions: A forenoon session beginning at 10 o'clock daylight saving time (9 a.m. Eastern time); an afternoon session at 2; and a banquet in the evening at 7.

AMERICAN LEATHER CHEMISTS ASSOCIATION will hold its eighteenth annual meeting at the Hotel Ambassador, Atlantic City, June 9, 10 and 11.

AMERICAN MINING CONGRESS AND NATIONAL EXPOSITION OF MINES AND MINING EQUIPMENT will hold its twenty-fourth annual convention in the Coliseum, Chicago, Oct. 17 to 22.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS is holding its spring meeting at the Congress Hotel, Chicago, May 23 to 26.

AMERICAN SOCIETY FOR STEEL TREATING will hold its third annual convention and exhibition Sept. 19 to 24 at Indianapolis.

AMERICAN SOCIETY FOR TESTING MATERIALS will hold its 1921 annual meeting in the New Monterey Hotel, Asbury Park, N. J., during the week of June 20. Technical sessions are scheduled as follows: Tuesday, on Preservative Coatings and Textiles; Wednesday, on Cement, Concrete and Road Materials; Thursday, on Ceramics, Lime and Gypsum, on Petroleum Products and on Testing Methods; Friday, on Metals.

THE NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (SEVENTH) will be held during the week of Sept. 12 in the Eighth Coast Artillery Armory, New York City.

NATIONAL FERTILIZER ASSOCIATION will hold its twenty-eighth annual convention at the Greenbrier Hotel, White Sulphur Springs, W. Va., the week beginning June 20.

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stettens Restaurant, 842 Broad St., Newark, N. J., the second Monday of every month.

SOCIETY OF CHEMICAL INDUSTRY (BRITISH) at the invitation of the Montreal section will hold its annual meeting in Montreal and other Canadian cities during the week of Aug. 29, 1921. Details will be printed in this magazine from time to time.

STAMFORD CHEMICAL SOCIETY, Stamford, Conn., holds a meeting in the lecture room of the local high school on the fourth Monday of each month, except June, July, August and September.

Plan to Make New Tariff Duties Immediately Effective

FEW pieces of legislation have aroused as much discussion as has Representative LONGWORTH'S resolution to make the provisions of the permanent tariff bill immediately effective as soon as it is reported to the House by the Committee on Ways and Means. The object of the resolution is to prevent large losses of revenue to the Government while the bill is under discussion, due to the fact that when the proposed higher rates of duty become known importers will promptly bring in large quantities of goods. This loss of revenue has always been recognized and regretted, but hitherto Congress has been unwilling to give immediate effect to legislation prior to its formal consideration and enactment. Evidence is not lacking that this precedent will still be followed, although a determined effort will be made to adopt Mr. LONGWORTH'S plan. It is admitted by all who favor the protective tariff that this would be of incalculable benefit to American manufacturers, but doubt is expressed as to the Senate's accepting the plan, although it is customary in Great Britain, France, Italy, Canada, Australia and other countries.

Experience shows that it requires from five to nine months for tariff legislation to take its regular course through Congress. During this period, as Representative LONGWORTH points out, the loss of revenue resulting from artificially stimulated imports will run into hundreds of millions of dollars "at a time when the Government is in need of revenue as never before, and when the resulting damage to American industries will be incalculable." In similar vein is Secretary HOOVER'S comment in a letter to the Committee on Ways and Means, in which he says:

"It seems to me desirable that the new tariff should be made legally effective upon the introduction of the bill. This is the custom in many countries. It prevents a large amount of speculation. Of even more importance, however, is the fact that during the period of discussion there is always a flood of goods in anticipation of the tariff. This decreases the revenue and renders the position of our commercial community extremely difficult."

This is not the first time that the Committee on Ways and Means has been confronted with this problem. In April, 1917, it sought the advice of the Tariff Commission on the subject and was advised that there could be no valid objection to making the tariff effective on the day on which it is reported to the House provided certain rights of importers are safeguarded. The commission was of the opinion that the proposed taxes should not be collected at once, but that importations could be continued under regulations determined by the Secretary of the Treasury whereby importers could give bond insuring payment of such duties as might finally

be enacted. Further, the rights of those who have made, prior to the date fixed, contracts for the sale of taxable imported articles should be protected either by authorizing them to recover from the purchaser an amount equal to the increased tax or by reimbursing them for their losses accruing on contracts on account of the increased duties. The first method was recommended by the Tariff Commission as being in the interest of the Government. With suitable safeguards for importers, it seems right that tariff changes should be made without advance notice to the public, as such notice creates abnormal buying by importers to the detriment of domestic industry and loss of revenue to the Government. If Mr. LONGWORTH'S resolution should be adopted the legislation would put the selective embargo on dyes into almost immediate effect.

For the Improvement Of Society Meetings

SOMEHOW—and frankly we confess that we do not know just how—a change is needed in the conduct of the divisions and sections at the great meetings of the American Chemical Society. Too many papers are presented, and many of them are not worth it. The opportunity for adequate and enlightening discussion in a great many cases is not available. In the Division of Physical and Inorganic Chemistry at the Rochester meeting there were sixty-four papers, and in order to be fair to each speaker his time was limited to ten minutes. But even if it is fair to give each author his fractional portion of the time available such an allotment is not right. What is needed is some kind of a sifting process, so that only important papers are read, and for these there should be plenty of opportunity for discussion. We think, too, that the chairman of each division should avail himself of his high-handed privileges, and cut off discussion that is not germane on the ground that it is out of order. Then if the speaker believes that he has something important to say he can appeal from the decision of the chair.

Censorship is needed, and it may be that for the main portion of these divisional assemblies papers should be presented only on invitation. This would not prevent contributions from unknown authors, because any member would be free to advise the chairman or secretary of the division that he had a paper on a given subject, and accompany it with a digest of its contents and a statement of the time needed for its delivery. Then the officers of the division could determine whether to accept it or not.

One of the leading chemical thinkers of the day said lately that the real meetings of the society take place in hotel lobbies, and suggested that it might be desirable to have rooms set aside and times fixed for dis-

cussions on certain subjects under informal rules, inasmuch as hotel lobbies are inconvenient places for talk. On the other hand, one of the most valuable privileges of these meetings is the opportunity that everyone present has to see and converse with the one authority or person he wants to meet, and the very fact that these miscellaneous assemblies in the lobbies are without specific purpose gives the questing visitor a better chance to find his man than he would have under more definite planning.

At the spring meeting in Rochester last April, generally speaking, the discussions were more important than the papers, and this state of facts is desirable rather than otherwise. Unfortunately this discussion is not recorded and published by the society. But while we would rather praise than find fault with the conduct of the divisions we think most serious minded members will agree that papers are getting too numerous and that many of them are not worth the time they consume at a general meeting.

The American Electrochemical Society prints and distributes in advance the papers that are to be read at its meetings, whereupon usually a mere abstract is given at the session, although the discussion which follows is based on information because the auditors are assumed to have read those that interest them beforehand. To print such a vast number of papers and to send them to 15,000 members of the American Chemical Society would inflict upon it a bill for printing and postage that would soon deplete its treasury, so that methods which are possible for smaller groups could not be carried out here.

The solution of the problem must be found and agreed to by the vice-presidents and secretaries in charge of the various divisions, and we know full well how difficult it is to effect changes in methods of administration after these have almost become conventions through years of practice. We believe, however, that before the year is out some improvement in this respect may be proposed. It is a hard task, and we are not closing our eyes to the difficulties; at the same time we desire to press rather urgently upon the officers of the various divisions the need of reform in the order and selection of papers presented.

Cracking Brass

By Corrosive Reagents

ELSEWHERE in this issue is presented an abstract of an important paper by Messrs. MOORE and BECKINSALE and Miss MALLINSON on "Season-Cracking of Brass." While the conclusions as to season-cracking confirm ideas commonly held by American metallurgists, it is especially important as a contribution to the scant data on what might be called "corrosion-cracking," a phenomenon thought by the authors to be identical with "season-cracking," but induced after a very short lapse of time by the action of special reagents.

Such studies cannot very well ignore the more general problem, "What is the mechanism of failure in metals?" Only by knowing how and why can we take steps to prevent unexpected failure. Without knowing how and why one can only accept unlooked-for fractures as the normal risks of life.

A consideration of the mechanism of metallic fracture brings one immediately to the important work at the English National Physical Laboratory of WALTER ROSENHAIN, who has probably done as much as any other

man to substantiate the idea that crystalline grains are cemented together by a film of non-crystalline or amorphous metal, thin sheaths whose atomic arrangement is very confused, corresponding to neither of the abutting grains nor to any definite intermediate orientation. Consequently even the purest metal is a complex aggregate, and its behavior will depend largely upon the relative amount and individual properties of the two phases and their mutual arrangement.

Crystal grains may be made to grow to such size as to comprise the entire cross-section of a wire or small test-piece, and their properties are thus capable of determination. Crystals support moderate loads in an elastic manner indefinitely. If the proportional limit is passed, ductile crystals deform by breaking into block-like fragments, which appear to wheel or slide instantly into new positions and then freeze into greater stability. The piece acquires a permanent set, but automatically has become harder and stronger. Increasing the load still further causes ultimate failure along crystal or gliding planes rather than at the boundaries—that is, rupture is transcrystalline rather than intergranular.

In view of the minute amount of amorphous material in a metal, its properties are known mostly by inference and by experiments suggested by the properties of such well-known amorphous materials as glass, pitch, beeswax or celluloid. Though apparently solid, amorphous material is thought of as merely an undercooled liquid possessing high viscosity. It may yield slowly under relatively low, long-continued stresses; its breaking strength depends upon the time the load is imposed. On heating, it loses strength rapidly. Depending upon the relation between temperature and viscosity, some amorphous materials like pitch yield slowly under continued stress even in the winter time. At normal temperatures, however, amorphous metal is harder and stronger than the crystal itself—rupture is normally transcrystalline. Similar hard, strong amorphous material is doubtless generated at the boundaries of crystalline blocks formed during plastic deformation—hence the hardening and strengthening induced by cold-work.

Such in brief is the amorphous theory, which has done yeoman duty in explaining many bizarre facts. Yet it should be noted that some metallurgists are as irreconcilable to the idea of amorphous intergranular cement as are certain Senators to the Versailles Treaty. LE CHATELIER, HEYN and HATFIELD are their leaders. One may or may not like their ideas, but these dissenters at least must be given credit for forcing their opponents to search out and marshal all their supporting facts. A very useful function for dissenters, truly, for we are all too prone to accept without question the plausible words of authority!

Yet a critical supporter of ROSENHAIN's theory would be inclined to question MOORE, BECKINSALE and MALLINSON's statement that "it does not appear to be necessary to ascribe peculiar mechanical properties to the intercrystalline substance in order to explain the phenomena of season-cracking." They have shown that mercury and ammonia react with amorphous material, destroying its strength. Hence corrosion-cracking, like season-cracking, is essentially an intergranular rupture. However, spun cups made from cold-worked brass do not crack as readily as the same cup from soft brass, despite its undoubted excess of amorphous material. The authors think that this is due in part to absorption of the reagent by the amorphous material in the crystalline

slips, thus diffusing the selective weakening. This assumes that the bulk of the new amorphous phase formed by cold work is at crystalline slips rather than grain boundaries—an undemonstrated point, to say the least. Yet, if there is no difference in amorphous material existing at crystalline boundaries and slips, then rupture should be both across and between the grains, because mercury absorption, and consequent weakening, should occur in amorphous metal existing on both kinds of surfaces. But corrosion-cracking is always intergranular.

An aggregate of atoms is either amorphous or not amorphous. Degrees of non-crystallinity are not readily distinguishable. Yet why does mercury or ammonia always seek out the structureless material at the grain boundaries, and never cause rupture in that existing within the crystal, unless the former has certain special properties denied by the authors?

Further Comment on Occupational Diseases

REFERRING to our recent comment on Prof. BASKERVILLE'S report to the American Chemical Society for the Committee on Occupational Diseases, we note in the *Journal* of the Society of Chemical Industry of April 30, 1921, some additional observation by Dr. STEPHEN MIALL.

"Broadly speaking," he says, "constant exposure to any chemical compound is likely to be injurious to health, particularly if it is likely to give rise to dust, fumes, or gas, and . . . an abundant supply of fresh air is the best method of protecting the health of the workers . . . All forms of dust and fumes are bad. Constant exposure to coal dust and tar causes what is known as pitch-makers' cancer, tar being the main irritant in this case. The manufacture of marmalade causes injury to the skin by the peeling of oranges and lemons, fine silica dust affects the lungs in a particular way, etc."

Sometimes excellent measures of prevention do not cure, as was the case of prohibition by the Swiss Government in 1879 of the use of yellow phosphorus in making matches. The workers then felt that they could dispense with all precautions where the alleged "harmless" red phosphorus was used, and the poisonings became more frequent than before. It was necessary to alter the law.

Cases of poisoning by carbon monoxide, nitrous fumes and ammonia are increasing in Great Britain, and yet these cases are almost all due to ignorance of the dangerous character of the fumes on the part of the workers. There is no difficult chemical problem in preventing this form of poisoning. A fatal case of benzene poisoning was noted following "improvements" which decreased the ventilation, and an analysis of the air showed two to ten parts of benzene in 10,000 parts of air. No other cases followed after the ventilation was increased.

Turpentine poisoning produces kidney disease and seems to predispose the worker to gout. Persons who are susceptible to the smell of a newly painted room have attributed the illness to white lead or to other causes. It is hardly believable that a volatile lead compound is given off as a gas or emanation from lead paint, and the experience of the past twenty years indicates turpentine as the delinquent.

Autopsies of fatal cases in New South Wales showed

in analyses of livers from 0.1 to 0.9 grains of cadmium per pound with merely a trace of lead. Dr. MIALL believed these occurred in the zinc-smelting industry of that region. The symptoms of cadmium poisoning include kidney disease, constipation and loss of appetite. Zinc is a general protoplasmic poisoning and in the higher animals it causes muscular contraction and kidney disease. Copper, tin, nickel and manganese have injurious properties, but cases of poisoning by them are rare.

White lead has been a fruitful producer of disease. About thirty years ago there were many preventable cases of lead poisoning in Great Britain, amounting in the white lead industry itself to about 400 cases a year, in making china and earthenware 200 cases and in printing, glass, shipbuilding and other industries about 400 more, making over 1,000 in all. Restrictions as to improper use, removal of dust, substitution of an insoluble lead silicate for white lead in the glazes of china and earthenware, rules for wearing overalls, etc., have caused a steady decline. Indeed the number of cases has decreased from over 1,000 cases annually to eleven cases in 1898 and twenty-one in 1919. It is said that lead poisoning is not caused by particles of lead swallowed by the worker, but rather by even more minute particles floating in the air inhaled into the lungs and so getting into the system. The headache complained of by painters is more likely to be caused by turpentine than lead. Diagnosis is difficult, and poisoning by cadmium, turpentine, arsenite of copper and other agents is often erroneously classed as due to lead.

Resignation of A.I.M.E. Secretary

MEMBERS of the American Institute of Mining and Metallurgical Engineers will learn with surprise and regret of the resignation of BRADLEY STOUGHTON, who has been secretary of the Institute since 1913. Mr. STOUGHTON is retiring in accordance with his personal conviction, which has been known to some of his more intimate friends and associates, that the office of secretary of the Institute should not be a permanent one and that too long a tenure of office is likely to create relationships that cannot be terminated agreeably. Past events, not only in the A.I.M.E. but also in other national technical and engineering societies, lend abundant support to the sentiment that retention of a secretaryship by one incumbent for more than ten years is likely to lead to undesirable complications. Mr. STOUGHTON'S resignation is to be accepted at the convenience of the board. When he retires it will be with the good will of all members of the Institute who have had occasion to come in contact with him. During his tenure of office the Institute activities have increased in number and complexity. The membership has increased from 3,500 to over 9,000. Local sections have grown in number from four to twenty-six; technical committees have multiplied until they now number eighteen. The growth in volume of transactions is known to all the members and the public activities and traveling that have fallen upon the secretary are matters that even most remote local sections of the Institute have recognized. The period has been a notable one in the development of engineering societies as factors in the national welfare, and Mr. STOUGHTON can derive no small satisfaction from his personal contribution to this development.

Readers' Views and Comments

Measuring the Flow of Gases

To the Editor of Chemical & Metallurgical Engineering

SIR:—My attention has been called to the article in your May 4 issue by Prof. C. R. Hayward on a device for measuring the flow of gases. This device consists of a differential gas flow-meter in connection with a pipe line. The statement is made in the article that by using plugs with different sized openings in the differential manometer it is possible to calibrate the apparatus with air so that the exact flowage of any quantity of any gas may be read from curves based upon this calibration.

Prof. Hayward does not mention the fact that these calibration curves as determined by the use of air are not applicable for the measurement of any other gas unless it has very closely the same molecular weight as air possesses. This is, of course, for the reason that the amount of gas flowing is inversely proportional to the square root of its molecular weight. It will therefore be apparent that apparatus of this sort standardized against air would be useless, let us say for a benzene-air mixture, unless recalibrated with a mixture of benzene and air, since the molecular weight of benzene is nearly four times that of air. It is also possible to calculate from the amount of air flowing under given conditions, using the curve derived from a test with air, the flowage that would occur with any other gas under given conditions, provided the molecular weight of this gas is known. It seems to the writer that the article was misleading in that it would suggest that the use of the air calibration curves is universally applicable to all gases.

Cambridge, Mass.

R. G. KNOWLAND,
Consulting Chemical Engineer.

To the Editor of Chemical & Metallurgical Engineering

SIR:—There have been published at various times in the literature devices and means of measuring the flow of gas which do not give accurate volumes.

In a recent article by C. R. Hayward in Vol. 24, No. 18, of CHEMICAL & METALLURGICAL ENGINEERING with reference to the measurement of gases, we note that no corrections to the volume as read from a predetermined chart are mentioned regarding the density and temperature variations which may be encountered.

If a brief summary of the fundamental equation be considered concerning the flow of gases through small openings, it will be readily observed that from Torricelli's theorem the velocity of a jet of gas is

$$V = \sqrt{\frac{2p}{d}}$$

Where V = velocity.

p = differential or difference in pressure
on the two sides of the orifice.

d = density of the gas.

It is obvious that the velocity and consequently the volume of gas passed is inversely proportioned to the square root of the density of the gas.

Since the orifice meter is calibrated with air (sp.gr. = 1.0) and at some definite temperature (T_1 absolute), then to account for other temperatures and specific gravities, the final volume as obtained from the curve

must be multiplied by the following factor, which considers change in gravity and flowing temperatures of the gases metered.

$$\text{Factor} = \frac{1}{1} G \times \sqrt{\frac{T_1}{T_2}}$$

Where G = sp.gr. of gas (air = 1.0).

T_1 = absolute temperature base or orifice.

T_2 = absolute flowing temperature.

Inasmuch as numerous investigators are constantly using various forms of flow-meters and considering the importance of accurate measurement of gas, this correction may prove very useful.

Who Is a Chemist?

To the Editor of Chemical & Metallurgical Engineering

SIR:—It must be evident to a thoughtful employer of chemists that the letter of "Chemically Trained Worker," on "Who Is a Chemist?" published in your April 6 issue, must have been written in a mediæval frame of mind. To be sure, the advertisement in the New York Herald, which "Chemically Trained Worker" cites, is not a model of clearness, but when the advertiser stated that "no special experience" was necessary, he revealed himself at least as a very practical person.

"Chemically Trained Worker" is one of those who still bows down before the fetish of "experience." There are actors who have been spouting blank verse for twenty years, but who will never play Hamlet acceptably. They have "experience." There are chemists who likewise have had twenty years' experience but who are utterly useless in a laboratory.

Give me a young man with aptitude and in a few months I will give him all the experience that he will require. Experience without aptitude is worthless. In the term "aptitude" I include imagination, resourcefulness and ingenuity—all of them worth far more than the "experience" that still hypnotizes employers. I would rather take a young man who was graduated with honors from a good technical institution and whose professors assure me that he has the qualities that I demand than one of those hard-shelled "experienced" routineers who will never make any contribution to the literature of his profession.

New York City.

WALDEMAR KAEMPFERT.

Cost of Nitrogen Fixation in Norway

To the Editor of Chemical & Metallurgical Engineering

SIR:—With reference to the article in your March 23 number, page 531, and comment in the April 20 issue, page 681, your attention is called to Molinari's General and Industrial Chemistry, 1912 edition, pp. 304-307, which substantiates Mr. Jensen. There is also an article in the General Electric Review for January, February and March, 1917, called "Literature of the Nitrogen Industries," which is very valuable and bears out in reference to the Birkeland-Eyde process the remarks of Mr. Jensen.

American Oil Chemists' Chicago Meeting

Progress Shown Through Reports of Committees—Dr. C. L. Alsberg's Address on Organization of Research in the Federal Service—Barrow-Agee Laboratories Wins Silver Cup on Check-Meal Contest—Engineering Papers, Committee Reports and Officers Elected

THE twelfth annual meeting of the American Oil Chemists' Society, which until this year has been known as the Society of Cotton Products Analysts, was held at the Congress Hotel, Chicago, Ill., on May 16 and 17, the two days just preceding the silver anniversary convention of the Interstate Cottonseed Crushers' Association meeting at the same location. This organization is perhaps without exception one of the liveliest aggregations of chemists in the United States, as shown in these annual meetings where discussions and debates are carried on without restraint. Doubtless this is accounted for by the fact that all the members are interested in one subject—namely, the oil industry.

PAPERS PRESENTED

J. W. Bodman delivered an excellent treatise on "The Manufacture and Grading of Distilled Fatty Acids," outlining the process of double distillation, showing diagrams of apparatus and giving actual operating figures. The diagram of a plant in operation showed a cast-iron fatty acid still about 9 ft. in diameter, 24 ft. in height over all, with copper conduits connecting the dome with the barometric condenser. Copper on an average is more satisfactory than aluminum because it is much easier to obtain coppersmiths for repair than it is aluminum workers at the present time. Receiving eggs are located beneath the barometric condensers and rotary vacuum pumps are connected to the end of the system to draw the vapors through. Normal charge placed in the still is about 15,000 lb. of fatty acid. Superheated steam is supplied from an outside source. One pound of steam distills 2 lb. of fatty acid at the rate of 1,500 to 2,000 lb. of fatty acid double distilled per hour.

By covering the still with 85 per cent magnesia a fuel saving of one-quarter of the total amount burned was effected. Eighty-five per cent double-distilled fatty acid was recovered from foots. No chemical control is used at the present time for determining when the pitch is finished, but the judgment of the operator is relied upon. Something of the importance of the industry of distilling fatty acids may be derived from the fact that in the United States in 1919 the amount of fatty acids distilled was 7,428,000 lb., while in 1920, 89,516,000 lb. was distilled.

Future improvements contemplated involve the elimination of separate heat for superheating the steam and the employment of the latent heat of vaporization as it passes from the still for this purpose.

It has been said that entrained coloring matter cannot be removed from the vapors by any mechanical device, but this has been accomplished by the design of two pear-shaped separators. Vapors are whirled tangentially against the corrugated interiors, giving a scrubbing action. These have been successfully tried out and will do much to increase the yield of white stock in the future.

Recent operating figures show that on a plant of this type the cost per day for actual operation is \$88.32, with an addition of \$62.50 per day overhead, including interest, insurance, depreciation, etc. The total cost per hundred pounds of double-distilled fatty acid is 65c.

In discussing the grading of fatty acids Mr. Bodman spoke of the various features involved, as to whether the analyses shall be made by reflected or transmitted light, stating that transmitted light as read through a 1-in. cube is probably the best method to be settled upon. He made a special plea for getting away from the indeterminate method of grading acids good, fair and poor, which means nothing.

ORGANIZATION OF RESEARCH IN THE FEDERAL SERVICE

Dr. C. L. Alsberg, chief of the Bureau of Chemistry, gave a short talk on the proposed reorganization of federal research, referring to some of the nonsensical proposals for this reorganization and some of the principles which should govern it.

In discussing what the function of the federal research should be we must consider what is going on at the present time. Congress appropriates money only for things which can be turned into dollars and cents. This is wrong, but it is the actual condition. The primary function of government is to carry on fundamental research which may not be evaluated in the generation in which the work is done. Only the Federal Government can afford to carry on certain types of work which is beyond the pocketbooks of the corporations, because it takes large sums of money for fundamental research and these are available only to the Government. Industries also cannot afford to spend the time required to develop a particular project.

No one can predict the value of definite fundamental researches at the start of the work, yet many pay big, as in the case of the development of the telephone and wireless in the electrical industry. There is no systematic research being carried on today, the work being done hit and miss. Investigation of thermodynamics is much more important than the value of making certain sirups from sweet potatoes, but the money cannot be obtained for the former.

So long as the Federal Government does not recognize the need of fundamental research the Government organization should be patterned after the industrial research laboratory rather than the organization of the university research laboratory.

Canners, for instance, deal with farming and plant industry, the work being divided into agriculture, manufacturing and marketing. What is the use, for instance, of forcing the canner to deal with three separate Government departments instead of one department which understands his whole problem? The commodity should then be handled in one department. There is no logic in such a division as now exists caus-

ing endless duplication and overlapping of the work. Industrial bureaus should have the right to employ any kind of technic in solving the problem for which Congress appropriates the money. We must get away from the idea of a bureau of one science and have one department on each product or industry. We cannot separate production, utilization and standardization, and so must have regrouping according to commodities instead of sciences as long as the Government insists on practical results.

In regard to the regulatory laws which must be administered by scientific men, they are of a corrective rather than a criminal nature, and decisions handed down must be constructive. Such will be the case if the laws are administered by a department familiar with the particular industry in question.

Our Government is not doing its duty in regard to fundamental research, and this is because the public is not asking for it. Consequently we are passing through a difficult period. Industries are hostile because of fear of inventive competition. This will be removed if the Government carries on more fundamental research than that which is immediately useful. The organization would be especially effective for industries composed of numerous small companies and not so necessary as in the case of the electrical industries which are controlled by a small group, for instance.

RANCIDITY: ITS CAUSE AND PREVENTION

Robert H. Kerr, of the Bureau of Animal Industry, outlined the organization for handling samples at the bureau in analyzing for spoilage due to rancidity and other causes. The other causes involve decomposition of insoluble proteins by bacterial action. Literature on rancidity is incomplete, no systematic study ever having been published.

Fats change due to a shifting of atoms in the glyceride molecules and polymerization; due to reaction with water, and the entrance of oxygen forming an infinite variety of products. There is really little known of the organic compound formed with oxygen.

Rancidity is distinguished from sweetness by common methods—namely, odor, taste and a definite Kreis test.

The bureau has spent considerable time on research as to the development of rancidity and found that it does not occur without the admission of oxygen. If there is no oxygen present a fat never becomes rancid. Four bottles of cottonseed oil placed in a dark room for ten years, three sealed with glass stoppers and one with cork, showed the oil in the three with the glass stoppers to be in perfect condition at the end of that time, while oxygen leaking through the cork had made the contents of the fourth bottle become rancid.

Light helps rancidity. Oils placed in blue bottles will become rancid quicker than those in brown, due to the actinic rays. Heat promotes rancidity, as demonstrated in refrigeration sample comparisons. Moisture aids rancidity. So do certain metals, chief among which are copper, zinc, tin and aluminum. Sterilization has no effect on rancidity, an unsterilized fat becoming rancid as quickly as one which has been thoroughly treated. Glycerides of unsaturated acids become rancid quickly. Foreign earths used for bleaching promote rancidity. All fullers earth has oxidizing power.

No case of rancidity refutes the theory that oxidation

is the cause of it. The present practice for the prevention of rancidity of oils in tank cars, etc., is sound and cases of rancidity, where they occur, are due to departure from standard practice. The main thing is to keep tank cars, packages and containers filled and tightly sealed.

OTHER PAPERS

Papers read by title only were: "Observations on the Use of Solvent Extraction in the Vegetable Oil Industry," by Glenn H. Pickard, and "The Wording and Impracticability of Certain Parts of the Rules Covering the Oriental Oils."

COMMITTEE REPORTS

The chief work of the two days' meeting was devoted to reports of numerous committees involving vital facts and findings relative to the vegetable oil industry. All discussions were permitted only when a motion was before the house, which had the effect of securing prompt action and warm discussion. President Porter admitted of no straying from the main issue.

The membership committee, reporting 263 members, recommended an elimination of the requirement for membership which involves that a member have at least five years chemical training. The members voted down this recommendation, preferring to keep up the bars and maintain the high standard of the society.

Herbert S. Bailey, editor of the Chemist Section of the *Cotton Oil Press*, the official publication of the society, urged the members to enter a plea for more advertising for the annual issue.

CHECK-MEAL WORK

Dr. F. N. Smalley made numerous recommendations for the check-meal work for 1921-22 having to do with the mechanism of the contest for the silver cup awarded for the best analysis of certain samples each year. The suggestion that the announcement of the winners and awarding of certificates shall be made only at the next annual meeting was voted down by the members, since it was considered that publicity was necessary to earnest competition.

CO-OPERATION IN RESEARCH COMMITTEE

Reporting the findings of the co-operation in research committee, P. S. Tilson referred to the outline published by Herbert S. Bailey in *CHEMICAL & METALLURGICAL ENGINEERING*, vol. 23, No. 10, Sept. 8, 1920, p. 441, as a brief but apt outline of the situation. Members that are eligible may apply to the National Research Fellowship. Mr. Tilson is anxious to place a list of research problems for the universities to work upon and to raise \$25,000 from the membership for a co-operation plan like that carried on by the Mellon Institute and Massachusetts Institute of Technology.

MOISTURE COMMITTEE

W. D. Richardson, of Swift & Co., reporting on the work of the moisture committee, stated that drying tests made showed that during drying there was decomposition of the oils evolving small quantities of water, and that oxidation took place, adding to the weight by absorbed oxygen. The best that can be done is to adopt a standard oven and procedure. Blueprints of a jacketed oven where a glycerine water mixture was used in the jacket and heated by electric coils were submitted. This oven has been tried out for several

years by Swift & Co. and found to be inexpensive and satisfactory. It is further provided with a condenser at the end of the system and has produced very concordant moisture figures. The drying time employed was four hours at 102 deg. C. on the inside of the oven. Volunteers to use it in next year's check-meal contest are desired. It is needless to try the distillation process of drying, because the committee has found it useless.

COLOR OF COTTONSEED OIL AND MEAL COMMITTEE

Dr. David Wesson, reporting on the work of the color of cottonseed oil and meal committee, told of twelve new instruments for this determination which are being completed at the Eastman Kodak Co., Rochester, N. Y., and a second apparatus which is being designed by the Bureau of Standards. The latter depends on the amount of light transmitted to a definite wave length through a definite column of oil. The sample has to be placed in a special trough and measurements are governed by the distance between prisms immersed in the oil. The committee will hold a meeting at the Bureau of Standards for investigating this instrument during the summer. In this connection Dr. Priest, of the Bureau of Standards, described the mechanism and mathematics of the instrument involving the kind of light, the properties of the material, and the character of the observer. The advantages of this instrument are universal validity, and standardability.

BLEACH TEST AND FULLERS EARTH COMMITTEE

The bleach test and fullers earth committee has checked the standard method of analysis and agrees to no change. The interstate rules bind the members to the use of English fullers earth, since the domestic is not so good for bleaching, but everyone is after the matter to discover the proper material.

DAMAGED SEED AND SEED ANALYSIS

The damaged seed and seed analysis committee reported that questionnaires were sent to the commercial chemists of the South for standardizing reports, and rules were proposed. The results should be reported as yield of 1,900 lb. of available seeds. The damaged seeds should be reported by count and not by weight. The percentage of damaged seeds should not be taken into consideration when figuring the yield.

AMMONIA COMMITTEE

The ammonia committee in reporting on questionnaires stated that of the replies sent out eighty-six answers were received, sixty-three of which used the Gunning mercury method, twenty the Gunning copper method and the remainder the Kjeldahl method. All but seven replies used some form of trap bulb in the analysis. Arrangements have been made for the General Chemical Co. to prepare a standard supply of ammonia sulphate and ammonia carbonate for distribution in checking samples.

OIL CONSTANTS COMMITTEE

L. M. Tolman, reporting for the oil constants committee, stated that an active effort would be made during the coming year to get a large collection of authentic samples for the Bureau of Chemistry to work upon for building up a set of analyses of American oils. The name of this committee was changed from the oil constants committee to the oil characteristics committee.

The report of the soapstock committee is given complete on page 43 of the May issue of the *Cotton Oil Press*.

SAMPLING COMMITTEE

E. R. Barrow, in a lengthy report of the findings of the sampling committee, presented drawings to show various types of designs to be considered for standard use in sampling in tank cars. The American Oil Chemists' Society 1920 sampler, and the Fash sampler, were recommended for special consideration. During the discussion on this report Dr. Wesson insisted that the purchaser should be allowed to empty the tank car and mix the contents before sampling instead of taking the core of the cars as is now done. The solution seemed to be that the shippers should take samples while loading the car and the purchaser while unloading. The report was finally referred to the chemists committee.

BUSINESS MEETING

Dr. David Wesson presented a code of ethics for the adoption of the society which each member should sign, involving the following points: (1) Purpose of the code to define rules of professional conduct. (2) Conduct to be in accordance with the highest ideals. (3) To uphold the standing of the profession with the public. (4) To behave as a gentleman and exalt the vocation. (5) To refrain from unreasonably low charges for professional services in order to advertise. (6) To refuse to lend name to questionable enterprises. (7) Differences and disputes between members to be referred to the governing committee. (8) To do nothing contrary to law and public welfare. (9) That it is unprofessional to advertise in any way except by legitimate business cards and its insertion in proper section of advertising mediums. (10) To serve only one client in each case. After some discussion the code was adopted by the society with the exception of No. 9.

The officers elected for the coming year were: President, C. P. Cluff, American Cotton Oil Co., New York City; vice-president, L. M. Tolman, Wilson & Co., Chicago; secretary-treasurer, Thomas B. Caldwell, Law & Co., Wilmington, N. C.

BANQUET

On Tuesday evening the members enjoyed an informal banquet at the City Club quarters, 315 Plymouth Court. The principal speaker of the evening was Dr. W. Lee Lewis, head of department of chemistry of Northwestern University and chairman of the Chicago Section of the American Chemical Society. His talk was replete with an unusual number of witty anecdotes, while the serious part was devoted to research at the university with reference to the Hoskins-Wileš plan for the promotion of scientific research as outlined on page 689, vol. 24 (April 20, 1920), of *CHEM. & MET.*

Other speakers of the evening were Dr. David Wesson, who told some unusually good stories and was followed by L. M. Tolman, who made personal references to all the members at the speakers' table. Dr. F. N. Smalley made the presentation speech for the silver cup on the check-meal contest, which was awarded to the Barrow-Agee Laboratories for the best work carried on over a period of three years. Herbert S. Bailey acted as toastmaster. The meeting closed with a vote of thanks to the chairman of the local entertainment committee, Dr. L. M. Tolman, for taking care of the members during their stay in Chicago.

Drill Steel From Hollow Ingots

A Definite Effort to Produce Hollow Drill Steel With a Decarbonized Interior Surface by Inserting a Mild Steel Tube in the Ingot Mold, Plugging It With Sand, Casting the Steel and Subsequently Rolling to Size

BY P. A. E. ARMSTRONG
Vice-President, Ludlum Steel Co.

HOLLOW drill steel is made by various methods: (1) The drilled billet with a sand-filled core, the general method used in this country. (2) The drilled, pierced, or the drilled and pierced billet, not sand-filled, is rolled down over a projectile or ball much the same as in ordinary pipe manufacture. System (2) is employed largely in Sweden. In Sheffield, England, the general scheme is sand-filling. Swedish hollow drill steel is particularly good and has a world-wide reputation for excellency.

It does not follow, however, that steels made by other methods are not efficient, because they are.

DECARBONIZED CENTERS IN SWEDISH BARS

In the Swedish material, a peculiar condition is present. The hole is badly decarbonized by the method of manufacture and the extent of this decarbonization varies in bars of different makes. Fig. 1 shows a polished and etched cross-section of very good grade Swedish hollow drill steel that is totally decarbonized $\frac{1}{10}$ in. deep, and the carbon varies from the carbon of the bar down to iron or carbonless ferrite through another $\frac{1}{10}$ in. Owing to difficulties in illumination, the altered structure is not so prominent as under visual examination.

Fig. 2 shows a much lighter decarbonized zone, being only about $\frac{1}{40}$ in. thick, but with certain radial cracks running from the hole into the bar. In this photograph it will be noted that the body of the steel is very dirty. There are a large number of slag inclusions which follow somewhat the original form of crystallization.

Fig. 3 shows another section of Swedish hollow drill steel with about the same amount of decarbonization as Fig. 2, but with larger radial cracks, carrying the local decarbonization in more markedly than in

Fig. 2. The zone of graded carbon content is about three times the width of that in Fig. 2.

Fig. 4 is another sample of Swedish hollow drill steel, much about the same as the others, only with a little heavier decarbonization. All of the bars shown in Figs. 1 to 4 inclusive have been rolled either on a projectile or without one, but they were not rolled with sand in the hole and represent the general run of Swedish hollow steel.

Fig. 5 is a piece of 0.85 carbon, 1 per cent chromium steel rolled from an ingot cast around a mild steel tube. The mild steel lining has a thickness of about $\frac{1}{10}$ in. and there are no cracks from the tube into the metal. There is a slight, but very slight, grading in carbon content between this tube and the metal. The reason for this is that chromium present in steel as an alloy prevents to a very large degree the carburizing of adjacent iron by saturation. I do not say that it is not possible to carburize mild steel by saturation because of the chrome alloy, but merely say it is more difficult than when the chromium is not present.

Fig. 6 shows a piece of 0.85 plain carbon steel having the mild steel tube core, cast and rolled in exactly the same way as that in Fig. 5, yet there is very little of the carbonless iron remaining. A very complete saturation has taken place, which shows very distinctly the difference brought about by the chromium.

INFLUENCE OF DECARBONIZED LAYERS ON HARDENING

A question that seems worthy of deep consideration is this: Is this decarbonized core an advantage or a disadvantage? If it is an advantage, why not duplicate this by controlled practice and not haphazard means of manufacture? If it is a disadvantage, then why is it that steel of this character has such a good reputation for being a good grade hollow drill steel? There is nothing in the steel that can be discerned microscopically or by analysis that proves it to be superior

FIGS. 1 TO 4. ETCHED CROSS-SECTIONS OF SWEDISH HOLLOW STEEL SHOWING MACROSTRUCTURES

Fig. 1. First-class hollow steel rolled over a mandrel. Decarbonized zone $\frac{1}{10}$ in. thick.

Fig. 2. Less clean hollow steel rolled over mandrel. Decarbonized zone $\frac{1}{40}$ in. thick.

Fig. 3. Badly cracked steel with thick region of graded carbon content.

Fig. 4. Heavily decarbonized rod of hollow drill steel.

to hollow drill steel of good manufacture made by methods that prevent decarbonization of the hole. Therefore it is fair to assume that the decarbonized wall of the hole is an advantage. On investigating this subject we found that hardened bars with this decarbonized hole do not become so intensely hard on the inside, neither are they so prone to cracking. Bars with radial cracks are of course bad, no matter what the system of manufacture.

LITTLE EXTERIOR DECARBURIZATION

Attention is drawn to the fact that the decarbonized hole shown in the photographs, particularly in Fig. 1, has much greater decarbonized rim in the hole than at the exterior of the bar. This probably may cause some wonder. I believe it is due to the fact that on reheating the bars and rolling them through the various mills the oxide is broken off the bar. When the bar is reheated it is subject to a fresh scaling and is not affected by the scale already adhering to the bar which in itself would set up decarbonization. Therefore, the exterior of the bar has to withstand only the decarbonization arising from the furnace gases and later the adhering scale from that heating; whereas the inside of the tube is affected by adhering scale at all times, adding to the decarbonizing effect of the reheating. The scale is partly reduced by the carbon in the bar, and as the scale is thicker the action is more pronounced.

The mild steel or decarbonized iron inside the hole acts as a damping effect when hardening is produced.

FIGS. 5 AND 6. HOLLOW STEEL ROLLED FROM CHROMIUM AND CARBON INGOTS CAST AROUND A MILD STEEL TUBE

This effect can probably be readily appreciated when the fact is remembered that if a piece of, say, 1 per cent carbon steel be rough-turned so that all decarbonization is removed from the outside of the bar and this be heated up to just above the transformation point and quenched in water of, say, 70 deg., the bars will come out hardened in spots in a non-uniform manner. Some places will be hard; others will not. If a further length of the same steel be rough-turned and then ground and polished, this bar, subjected to the same heat-treatment and same speed of cooling, will come out quite file hard all over and not at all spotty. The reason for this is that the rough-turning holds the steam arising from the heated metal in contact with the water, and thus causes certain zones to cool at a slower rate than those places where the steam which is generated was quickly removed.

In the case of the polished bar, there is no roughened exterior to hold steam pockets, and the steam, as generated, quickly rises to the surface of the cooling fluid and the bar is uniformly hardened over its entire surface. If this bar, which is polished, were covered with a thin tube, then the hardening would not be very pronounced underneath the tube. This of course would vary with the thickness of the tube and whether or not the tube was in good contact with the bar. Such a condition can artificially be produced by decarbonizing the surface of this polished bar. If this decarbonization is carried to a fair depth, say $\frac{1}{2}$ in., the bar will not be of maximum hardness underneath the decarbonized area after being quenched in water. The thicker the zone the less will be the hardness, and for the same reasons which prevent one from uniformly hardening a piece of similar carbon steel right through to the center when quenched from just above the transformation point. Another way of saying this is that the speed of cooling is only fast enough for a certain amount of penetration or depth of hardness. To harden right across the cross-section, alloy steels have to be resorted to, which have a greater lag to transformation.

HOLLOW STEEL FROM HOLLOW-CAST INGOTS

Hollow drill steel made by casting the metal around a tube and mechanically working the hollow ingot down to the required size (filling up the hole with sand and later removing same after rolling) will have an artificially produced equivalent decarbonized core which will be free from any such tendency toward splitting and driving in radial cracks as has been noticed in the photographs. The surface of the inside of the tube will be comparatively smooth, giving a uniform cooling rate to the inside of the bar, again reducing the tendency for a radial crack to start.

One of the reasons why the carbonless walls of the tube of the bars made by this method do not crack in manufacture is because the mild steel tube is not the result of a decarbonized steel highly impregnated by oxygen and oxides and having a number of microscopical holes where the carbon of the carbides last resided. These holes are places of weakness which may or may not weld up, depending on whether the interior of these microscopical cavities is coated by an oxide layer or filled with gas, either from the gas occluded in this steel or that which has penetrated from the furnace atmosphere. Decarbonized steel is, in my opinion, less strong than mild steel which has been originally made in low carbon and worked down to the required size.

The method employed by the Ludlum Steel Co. in the manufacture of hollow drill steel is to insert a high-grade low-carbon mild steel tube, suitably cleaned by sandblast, into an ingot mold and cast the hot metal around the tube. We fill up the tube with some air-excluding material so as to prevent oxidization and scaling of the inside of the tube, generally using a high-grade sand for this purpose. The ingots are then rolled in the usual way down to the finished bar. The bars are cut up to required length and the sand extracted by a special method, which is very speedy and extremely effective.

SEGREGATION IN HOLLOW-CAST INGOTS

Segregation is a thing which must happen in all steel solidification and this is responsible for a certain mechanical weakness in the finished bar. If the segregation can be so located as to have very little mechanical

effect, it would be desirable to make the ingots in that manner.

Casting hollow ingots by the tube method is particularly fortunate in this respect. As the segregation which is bound to occur will be concentric with the hole and its maximum occurrence is about midway between the exterior of the ingot and the tube wall, this area is very large in circumference, comparatively speaking, and the segregation is comparatively small because the distance between the tube and the ingot mold is small. This thin layer of segregation will be most noticeable at the top of the ingot. It can have no effect or at most very little effect upon the bar, as the segregates do not, under any circumstance, creep through to either the exterior or the interior wall of the ingot. Segregation is not removed at all in the pierced billets from solid ingots and is only very indifferently removed in the case of the drilled billet. Furthermore, even if segregated impurities are removed by using only the butts of the ingots, and drilling the billets, there is still carbide segregation to contend with. This will run in straight or nearly straight lines, parallel with the wall of the ingot or the line of freezing.

The inside of the hole of a drilled billet must, therefore, necessarily be the weakest place in the billet, resulting in a weak bar. Progressive fracture is easily started from one of these many sources of weakness.

INFLUENCE OF CRYSTAL SIZE ON QUALITY OF STEEL

Crystal size is of great importance. In a general way the smaller the ingot the better the steel. With a small ingot, the crystals are not very large, the crystallites or colonies of crystals not very far-reaching, and the speed of cooling from the liquid to the solid state fairly rapid.

In a 24-in. ingot, for instance, the crystallites are likely to be quite large and likewise the individual crystals forming them. Crystallites are also apt to have a uniform direction for quite substantial distances, depending entirely upon the temperature and the speed of cooling. If the steel is cast hot enough and quickly enough, a fractured ingot will show a complete diagonal structure, the crystallites growing out like columns until they touch one another, leaving room for no equi-axed crystals in the center of the ingot. If the temperature is lowered, the equi-axed zone is larger, and the pine-tree growth, which is the crystallite formation, is less.

A small ingot, although capable of producing a very high-grade steel, is very prone to this columnar structure, even though the temperature of casting be kept down, and there comes a time when the ingots are very small, say 2 in. square or round or whatever shape is desired, when it is almost impossible to cast the steel in such an ingot without producing pine-tree growth complete to the center, and an ingot which is therefore known among workmen as "scorched." An ingot of about 7 in. size can be cast so that it is quite free from excessive pine-tree growth. Crystal formation, however, will be larger in a 7-in. ingot, cast solid, than where the 7-in. ingot is cast with a tube in it, as in the latter case one has all the advantages of a 2-in. square ingot with none of its disadvantages—the sand-loaded core takes up the heat and prevents crystallite

growth, besides preventing the formation of large crystals.

The speed of cooling after solidification is slower in the hollow ingot than it is in the solid ingot, therefore the granulation, which takes place after the crystals have formed from the liquid metal, is apt to produce larger grains than in the solid ingot. This is not a detriment. The original crystal size is of much more importance. The size of the grains due to this granulation constantly varies in response to mechanical work and subsequent heat-treatment.

I have found that the size of the grains arising from the granulation of the crystals does not grow larger than the size of the original crystal. Instances arise and should be carefully noted where the crystal boundary is broken and two crystals will appear as one, merely because the solution potential of both crystals are the same and therefore etch uniformly to the external boundary of the two crystals. This is more noticeable when these adjacent crystals have approximately the same orientation.

Two very interesting photographs, Figs. 7 and 8, appear to show conclusively that the casting structure remains in the finished bar. The analysis of this sample is: Carbon, 0.90 per cent; vanadium, 0.25 per cent; manganese, 0.30 per cent. This steel was heated to 1,340 deg. F., a temperature just about its known transformation point, held for some time and then quenched in water. The piece was 1½ in. round made from a 7-in. square ingot, having a very fine structure in the broken fracture, extremely tough and,

FIGS. 7 AND 8. STRUCTURE OF VANADIUM STEEL ROD.
PICRIC ACID ETCHING

Fig. 7. Magnified 30 diameters.

Fig. 8. Same region magnified 400 diameters.

generally speaking, a very excellent piece of steel and for the tool for which it was used it gave some extraordinarily good results. Fig. 8 shows the structure as magnified 400 diameters, very fine, peculiar form of sorbite with troostite. Fig. 7 is the same piece magnified but 30 diameters. Here can clearly be seen the cast structure, which has remained in the bar right from the ingot. I believe that this piece of steel, generally speaking, will not have a crystal larger than the governing boundaries of the crystal from original casting. Naturally the crystals in this cross-section, which is at 90 deg. to the direction of rolling, will be smaller in that direction than when originally cast, although their total volume will be approximately the same.

Fig. 9 shows a piece of 3-in. square steel which was rolled out of a 10-in. ingot. It is a high-alloy steel and particularly prone to the formation of long crystals, meeting others along the diagonals of the section. During the mechanical work the crystal formation has become somewhat distorted. The structure of the bar, as seen by a fresh fracture, shows this piece of steel to have a very fine grain; the polished surface etched in the ordinary way shows the grain size to be small.

The crystal size is not clearly defined at first, but on prolonged etching the crystal structure of the ingot is clearly shown, while the grain outlines arising from granulation of the crystal have been entirely obliterated. However, the inherent weakness of this steel is laid bare by the prolonged etching with weak acid. This bar is obviously weaker along the original diagonals. All steels will show the original ingot form in the same manner, no matter how far the working may be carried down; some steels have their crystalline structure more readily disclosed by prolonged weak-acid etching than others. It has often been noted that one bar of steel out of heat or a part of the heat will give very much better physical results than another bar from the same heat or out of a different heat, and this is to a very large degree due to the crystalline formation in the ingots. Fig. 9 very clearly shows the reasons for this condition.

Hollow drill steel made from a hollow ingot accord-

FIG. 9. ENLARGED MACROSTRUCTURE OF $\frac{3}{8}$ -IN. ALLOY STEEL BAR ROLLED FROM A 10-IN. INGOT ENLARGED EIGHT TIMES

ing to our method is, therefore, a little safer to use when overheating has to be contemplated as a possibility, as the ultimate grain growth will be less than a similar sized ingot cast solid, for the simple reason that the crystals were originally smaller. I do not want to infer that hollow drill steel so made can be overheated and that then the steel will give the same satisfaction as if it were not overheated. I am merely contending that it is slightly less harmful, the reasons being as given.

SURFACE SEAMINESS

Surface weakness as shown by seaming and checking on the exterior when working the bars of hollow drill steel, or by cracking in hardening, is in some measure due to the surface stresses of the ingot when cast. We have found out that the temperature of the ingot mold or speed of freezing of the exterior of the ingot is of very great importance in this direction, and much seamy and cracked steel can be laid directly against a too quickly cooled skin. Ingots that are turned or milled all over will not seam very much in working, in fact they are practically free from seams, whereas an ingot rolled without a preliminary machining opera-

tion is full of seams and cracks, some long and some short.¹

It has generally been said that these short seams and cracks in the surface of the bar are the result of elongated depressions in the surface of the ingot and that if an ingot is cast very smooth it should apparently give less surface defects. This is in some measure true, but an ingot cast very hot and having a very smooth skin will crack and seam very badly in the mill. The surface of an ingot poured very cold which is very crinkly, due to the low temperature of the metal, will seam just as badly. The cause of the cracks and seams in one is not the cause of the cracks and seams in the other.

Rough spots on the surface of the very slowly cooled ingot are elongated by mechanical work; roughened places continue to be pressed together, hence seams and cracks in cold-poured metal. In ingots cast very hot the pine trees or crystallites are separated by planes of great weakness at about 90 deg. to the surface of the ingot. These in themselves will cause cracks, the ingot then being known as tender. To draw the happy medium as a basis of our consideration and forgetting extremes, which are really of no moment, when comparing an ingot cast moderately hot so that it is not troubled with excessive dendritic structure and an ingot cast somewhat cooler and having about the same smoothness of surface, there is practically no difference in the amount of seaming and cracking, providing the ingot mold in both instances is cold or nearly so. If the ingot mold is warm, or thinner than usual, there is less surface strain on the resultant ingot and for similar surfaces there are less seams. Ingots cast with a tube in them seem to be freer from these surface stresses and the resultant billets do not have to be chipped or ground nearly as much to produce a bar free of seams and cracks.

INTERNAL STRESSES

The smaller the ingot the less will be the tendency for surface seams and cracks which may or may not develop. Those that do not develop may be thought of as locations of inherent weakness. Steel will shrink about $\frac{1}{8}$ to $\frac{1}{4}$ in. to 1 ft. and the steel as poured into the ingot mold will immediately freeze and contract to, say, one-half of the total shrinkage. As the inside of the ingot then begins to cool at a later time, the solid surface is trying to maintain a larger area than is demanded by the lower layers. The exterior of the ingot must then be crushed or the walls sink in, in which case it is under tension in a direction normal to the surface. If the ingot mold wall is concave the ingot when cooling will come practically straight, therefore the surface of the ingot must be under tremendous compression and just beneath the skin of the ingot or the depth of the first frozen layer the steel must be under tension, being held under constraint by the outermost layers, already in high compression. When the ingot is reheated it does not completely remove these strains, and when subjected to mechanical work the ingot will proceed to "let go" in various places—an action which will readily be conceded as being responsible in some measure for seams, cracks and defects of the character under construction. The smaller the ingot the less the actual amount of shrinkage.

In a hollow ingot cast by the tube method the hole

¹Reference is not made to the seams arising from over-filling or lapping.

is increased in diameter by the freezing. The mild steel tube when heated up to the high temperature imparted by the cast metal is enlarged and continues to be enlarged until it reaches a maximum temperature. It then shrinks while the ingot cools, thereby relieving the exterior surface of the ingot from cracking, or having as much strain as a solid ingot. The mild steel tube will withstand this movement without giving way, whereas an ingot cast hollow but without a tube will not be very good, since the inside of the wall of the tube would be first under tension and then compression, and the metal would withstand these complex forces less well.

The tube method of making hollow ingots for the manufacture of hollow drill steel is a decided departure from the old methods, and the logic of it seems to show that the resultant hollow drill steel should be superior to that made by the older method. Tests made by the Ludlum Steel Co. to date show that such is the case; whether or not our premises are accurate, we believe that hollow drill steel made this way will withstand alternating stresses better than anything that has yet been produced of similar analysis. The reasons why we believe the tube method of hollow drill steel manufacture is superior to the older methods are:

1. Greater freedom from external and internal straining.
2. Because of the inherent small crystal size.
3. Absence of harmful segregation resulting in weakness of the wall of the hole.
4. Less liability for the steel to crack in the inside of the hole during forging or hardening.
5. Toughening effect, arising from the mild steel wall of the hole, limiting the intense hardening on quenching.

Watervliet, N. Y.

Chemical Reaction Affects Casein Glue

Although casein glues are highly water-resistant, they ultimately decompose when exposed to a damp atmosphere for a long time. For many months studies have been under way at the Forest Products Laboratory in an endeavor to discover the cause of this decomposition.

The decomposition study is still far from complete, but the conclusion has been reached that the decomposition of ordinary alkaline casein glues is not due to the action of bacteria or molds. It appears to be due entirely to chemical action of the alkali in the glue. This conclusion is based upon the following observations:

Increasing the amount of alkali in the glue increases the rate of decomposition when the glue is kept wet.

Glues containing no sodium hydroxide, although deficient in some important respects, do not decompose as rapidly as similar glues containing sodium hydroxide.

Cultures of molds and bacteria could not be obtained from decomposed alkaline glues.

Some chemicals which have antiseptic properties are found to improve casein glue, but this improvement is due to their chemical action rather than to their toxic properties.

Glues can be completely decomposed in a short time at temperatures above that at which bacteria can grow.

Further work is being directed toward the production of glues which will resist chemical decomposition and at the same time be impervious to the action of fungi and bacteria as well as moisture.

Rapid Method of Determining Moisture Content of Wood*

The moisture content of pulpwood chips can be found in from seven to ten minutes. A specified weight of wood chips, usually 100 g., is immersed in kerosene in a flask or retort, and the mixture is heated. The water in the chips changes to steam at 212 deg., and goes out through a glass tube in the cork of the flask, is condensed by a water jacket surrounding the tube, and is caught in a measuring glass. The boiling point of kerosene being higher than that of water, all the moisture will be driven off the chips before the oil vaporizes to any great extent. The oil that does go off in the form of vapor is condensed and caught in the same graduate with the water. When the evaporation of moisture is complete, the oil and water are allowed to remain a few minutes until all the water has settled to the bottom of the graduate. The amount of moisture in the wood chips is then found by a direct reading.

This method has been checked for accuracy with the method of weighing samples before and after oven drying, and the variation found to be less than 1 per cent.

Foreign Trade of the Philippine Islands in 1920

The foreign trade of the Philippine Islands in 1920 amounted to \$300,562,138, an increase of about \$64,000,000 over that of 1919. These figures are the highest in the history of Philippine commerce and were attained in spite of the premium on the American dollar, which ranged from 3 to 12 per cent during the year.

The total imports amounted to \$149,438,282.50 and the exports to \$151,123,855.50. In 1919 the imports and exports were valued at \$118,639,052 and \$113,117,826 respectively. The United States contributed 62 per cent, or \$92,289,778, of the imports, and absorbed 69 per cent, or \$105,216,262.50, of the exports.

The biggest item in the year's export trade was cane sugar, which was valued at \$49,619,260, of which \$39,349,934.50 worth was consumed by the United States. Next to sugar was Manila hemp, with a total of \$35,862,000, of which \$20,614,026 went to the United States. Also, the United States absorbed practically all the coconut oil shipped from the Philippines, amounting to \$23,268,886.50, and \$10,546,303.50 of the cigar exports, valued at \$12,721,138.

Significant increases were registered in the import trade. The total value of the automobile imports was \$7,460,683, compared to \$4,802,324.50 for 1919. Cotton and manufactures totaled \$10,117,182.50, as against \$7,409,135 for 1919. The imports of iron and steel products amounted to \$21,879,602, representing a decrease of \$487,985 from that of 1919. Wheat flour importation was \$4,721,076, an increase of \$256,493 over that of 1919.

Potash in Greensand

In the account of the meeting of the Division of Industrial and Engineering Chemistry at the Rochester meeting of the American Chemical Society R. Norris Shreve was reported as stating in his paper discussing the action of lime on greensand (p. 831, CHEM. & MET., May 11, 1921) that analyses of greensand found along the coast of New Jersey showed 3.4 per cent potash. This was an error in transcribing, as the analysis read by Mr. Shreve indicated 7.4 per cent potash in the greensand.

Commercially Pure Iron in the Basic Open-Hearth*

Notes on the Development of a Metallurgical Process for Producing Substantially Pure Ferrite on a Tonnage Basis, Without Containing an Excessive Amount of Gas—Many Modifications in Rolling Mills and Galvanizing Department Were Necessary to Make Finished Sheets

BY W. J. BECK

Director of Research, the American Rolling Mill Co., Middletown, Ohio

THE first announcement before a scientific and technical body that the manufacture of commercially pure iron had been successfully accomplished in the open-hearth furnace was in a paper¹ which was read at a meeting of the American Society for Testing Materials in 1911. The following significant paragraphs which remain equally true today are worthy of repetition:

The industrial history of the country has been characterized during the last ten years by so many important changes and developments that, taken as a whole, they may well be considered as marking a new industrial epoch. These changes may be defined in part as social and political, and in part as purely technical evolution. Thus we find extraordinary change and activity following in the wake of the great movements for conservation of natural resources and government control of the quality of foods, drugs, and other staples which enter into interstate commerce. The day when a complacent public would buy any material offered for sale, with little or no regard for specification and with implicit faith in every word printed on a label, has probably passed, never to return. Quantity rather than quality has heretofore marked the industrial supremacy of the United States, but the signs of the times point to the fact that hereafter the maximum quantity consistent with a standard of quality will be the slogan of the progressive producer.

Europe has long been looked upon as the home of research and conservation, and it is only comparatively recently that America has been brought to a thorough realization of the necessity of re-ordering her ways if she is to take her place in the upbuilding of the industrial future of mankind. It is satisfactory to note that the wave of conservation is sweeping along all the lines of industry, and the ruthless waste formerly so common in manufacturing methods is rapidly disappearing. Almost all new countries, especially if bountifully supplied with natural resources, have had this experience. It is the natural result of rapid growth which leads to a disinclination to consider apparently minor details until forced to do so by stern necessity. The movement for the conservation of our forest products, which is comparatively new in this country, is old and well known in Germany, and it is now very generally conceded that this country has taken up the study of the conservation problem none too soon. It is but natural in this great wave of economy the conservation of iron should have become such an all-absorbing subject. There can be no question but that this important commodity is directly and indirectly the greatest force for civilization that exists.

It cannot be questioned that there has always existed a demand for the purest obtainable irons. This demand has held steadfastly in the face of rapidly developing steel-producing processes. The steady importation of Norway and Swedish irons throughout our entire metallurgical history up to the outbreak of the war in 1914 is sufficiently indicative of this fact. These foreign irons, however, that had to be laboriously worked down by a charcoal or puddling process, were not suited to

the large-scale tonnage operations which are made imperative by American conditions of labor and industry. It is natural, therefore, that our metallurgists should have been led to the consideration of adapting the open-hearth steel furnace to the manufacture of iron of at least an equal degree of purity as those types which were imported from overseas.

Before progress along this line could be made, however, grave manufacturing risks had to be faced without much foreknowledge as to whether a successful, workable and salable product could be finally achieved. Every open-hearth man knows what is implied in raising the temperature of a bath two hundred degrees above the normal practice and maintaining this temperature until the carbon and manganese are run down to practical traces.

DEVELOPMENT OF THE PROCESS

The undertaking of pioneer work in this direction was certainly not altogether promising. Ledebur, the great German authority, had clearly stated in his compendious work on iron metallurgy that any such operation with the open-hearth furnace would be in vain if not freighted with disaster. In 1903, however, a very distinguished American metallurgist, H. H. Campbell,² made an attempt at an open-hearth pure iron, and finished with carbon 0.025, manganese 0.040. Campbell did not follow up this step, however, and summed up his opinions in the following brief comment: "These heats were made in a basic open-hearth furnace and their regularity both in chemical and physical character shows that we are dealing with a normal and definite metal and not with an accidental product. They were purposely made with the lowest possible content of manganese and it seems positively certain that the metal must be saturated with oxygen." It is evident from the foregoing that so eminent an open-hearth man as Campbell thought that in carrying manganese down to 0.04 the procedure had gone as far as possible and that only an overburned metal was the result.

This then was the history of the effort to produce very low carbon-manganese metal in the open-hearth furnace when the American Rolling Mill Co. first turned its earnest attention to the problem. The very first experimental heats were made in a 35-ton furnace, and they were nursed and watched with the most anxious care day and night. Continuous progress in the art was made until finally it was proved possible to reduce the five ordinary impurities of iron (carbon, manganese, sulphur, phosphorus and silicon) to the point at which in the aggregate they did not exceed fourteen-hundredths of one per cent. At the same time special methods had to be studied to attain the maxi-

*Paper read before the American Iron and Steel Institute, at New York, May 27, 1921.

²The Manufacture and Properties of Iron and Steel (1904), p. 482.

imum degree of degasification and the proper deoxidation.

The idea of a commercially pure iron was perhaps but a natural development or evolution of the effort to supply quality sheet metal products. It was believed at the inception of this work that increased purity would lead to increased rust-resistance.

Ingot iron made in an open-hearth furnace differs from the older irons in having a typical crystalline structure, a more definite critical temperature range, and more particularly in being essentially free from slag.

In the first heat an attempt was made to produce a metal containing not over 0.05 per cent manganese. It was done at the risk of losing the heat and the ladle, but it was felt that such a drastic step was necessary in order to determine if it were possible to make such a product in an open-hearth furnace. Care was used in the selection of the raw materials for this heat so that the melt would be as low as possible in carbon and manganese. The heat was charged in a 35-ton furnace and the bath of metal melted low in carbon, as it was believed that the lower the carbon could be driven the lower would be the manganese. Regular open-hearth practice was followed with the exception that an additional quantity of iron ore was added to assist in the removal of the carbon and manganese. In addi-

Fig. 1. Casting pit at the open-hearth plant, central works, the American Rolling Mill Co., showing bottom-pour practice.

tion to this an excess amount of lime was charged for the purpose of eliminating as much sulphur and phosphorus as possible.

These early experiments in the open-hearth furnace were made with producer gas as fuel. This fuel was high in sulphur which contaminated the metal and presented a serious obstacle. It was later found that by the use of natural gas this difficulty was largely overcome and it was possible to produce a metal which contained a lower percentage of sulphur.

In order to eliminate as far as possible the impurities in these heats it was found necessary to hold the metal in the furnace longer than is required in ordinary steel practice. In some cases these experimental heats were held in the furnace as much as 50 per cent longer than the ordinary steel heat, with danger to the operators and to the furnace.

On tapping the first iron heat into the ladle it was "wild." The normal amount of aluminum customary in

making steel heats had been used, but in later developments it was found necessary to increase materially the amount of aluminum to insure proper deoxidation and degasification.

In the early development of this iron it was made on a small plant basis, using bottom-pour ingots approximately 8 x 10-in. cross-section and weighing about 900 lb. In this bottom-pour practice (see Fig. 1) it was necessary to line with fireclay runner brick the runners which conducted the metal to the ingot molds.

In pouring the first heat the metal was so hot that the stopper rod burned off and there was much difficulty in pouring the metal. The molds were smeared and much of the metal was lost by pouring into the mold pits. Considerable cutting of the runner and ladle lining also occurred.

The ingots were stripped in the usual manner and sent to the reheating furnace for rolling into sheet bars. Here they were rolled into heavy gage bars without difficulty, and later rolled into 16-gage sheets and sheared to size for galvanizing.

As the next step in the operation the sheets were sent to the galvanizing shop for coating. Here considerable difficulty was found in pickling the sheets on account of the slow solubility of the metal, and also on account of the presence of foreign matter such as fireclay from the runner brick and ladle linings. In galvanizing the sheets further difficulty was encountered in the development of blisters and rough surfaces, which were afterward found to be due to imperfect degasification of the metal.

The analysis of this first heat of ingot iron was: Si trace, S 0.028, P 0.003, C 0.03, Mn 0.04. At that time it was customary to analyze only for these five elements—silicon, sulphur, phosphorus, carbon and manganese—the aggregate of these subtracted from one hundred, which was the basis then used, indicating the iron content by difference.

Several years were required to develop the material, even to the point of making this first heat, and for this reason the final and successful result was the occasion for much congratulation among the workers. A new metal with many unusual properties had been given to the world.

DEGASIFICATION AND HIGH TEMPERATURES

In the manufacture of such pure metal the process of degasification was not understood. It naturally followed that a large number of sheets were produced which contained imprisoned gases. When such sheets were galvanized the expansion of the imprisoned gases caused the formation of blisters up to 12 in. in diameter, giving a product which could not be sold even as wasters, and of doubtful value as scrap. This trouble resulted in a further search for a method to eliminate the gases which were responsible for the blisters. Green saplings were used by plunging them down into the bath of metal in the open-hearth furnace after the heat was melted, in an effort to agitate the metal to help remove the impurities. This slightly reduced the time of finishing the heat, but nothing could be found to substitute for the extremely high temperatures necessary to reach the desired analysis of the metal.

These destructive temperatures shortened the life of the furnaces and very greatly increased the cost of the metal. In fact, it was impossible to make this metal continuously in the furnace because of the cutting action on the linings due to the high iron oxide in the

Fig. 2. Photographs of split ingots.

slag. To meet this condition heats of pure iron were alternated with regular steel heats.

The experimental heats of iron produced many unusual and unlooked-for results. One of these heats contained so much gas that nothing but piped ingots were made. In fact, some ingots were piped from end to end with only a thin wall. These had the shape of the molds and weighed but a few pounds, whereas they should have weighed approximately 900 lb. It was an easy matter for a workman to carry one of these shell-like ingots on his shoulder as a spectacular "stunt" for his fellow workers.

Special efforts to secure iron of extreme purity were continued in the open-hearth department during the years 1906 and 1907. Every effort was made to produce a material of high purity. All practical suggestions (and many that were apparently impracticable) were tried. The principal difficulties, however, remained; that of the control of high temperatures necessary in producing this iron and the proper degasification of the metal.

As the experimental work progressed it was found that there were considerable differences in the practice of producing commercially pure iron as compared to steel practice, which materially added to the cost. In the first place, it required several hours longer to make an iron heat than a steel heat, and the final temperature of the metal was 200 deg. F. higher than a heat of steel. Another marked difference was also found between the percentage yield of metal as compared with the percentage yield when steel was made. The percentage of metal produced was several per cent lower in the iron heats because the high temperatures and longer time employed in the manufacture of iron oxidized more of the iron, which was lost in the slag.

It was also found that this high iron oxide content of the slag was responsible for the cutting action on the stopper rods and bricks and that the scorifying action increased as the percentage of iron oxide in the slag increased. It has been found that the iron oxide in this slag is several times greater than the iron oxide in the steel slag. Some of this iron oxide, however, is derived from the iron ore used in oxidizing the carbon and manganese.

In order to emphasize the importance of the selection of raw materials in the manufacture of commercially pure iron attention is called to the fact that there

are certain elements which if they exist in the raw material are not eliminated in the open-hearth furnace. Among these elements which cannot be eliminated are copper, arsenic, antimony, tin, nickel and cobalt.

THE CRITICAL TEMPERATURE RANGE

Early ingots were frequently split with a metal saw so that the interior structure and the degree of degasification could be studied. It was found that ingots degasified with a slight excess of either silicon, aluminum or even with the use of a small amount of ferro-manganese may be perfectly sound as far as gas pockets determine this factor. Nevertheless, such material will go to pieces when an attempt is made to roll it (see Fig. 2).

This breaking up of material degasified with an excess of degasifying agents led to the discovery of the fact that pure iron had to be worked within a certain range of temperature; otherwise, it was found to be red-short and could not be rolled. It was also found that not only was the rolling of commercially pure iron affected by the presence of impurities from the degasifying agents, but it was materially affected by the presence of sulphur. The higher the sulphur content the more difficult it is to roll this iron at any working temperature. Being almost pure this iron has, like many commercially pure metals, a critical range at which temperature it cannot be worked. This temperature is about 900 deg. C., but for working conditions it is impracticable to roll at temperatures between 800 and 1,000 deg. C. In the commercial manufacture of this pure iron it is necessary to roll the material above the critical range on the blooming mill and below the critical range on the bar mill, which necessitates cooling tables between the two mills, these cooling tables being unnecessary in steel practice.

This delays mill production and adds materially to the cost of iron.

Because of the tendency of the sheets to weld together at the higher temperatures the sheet bars also must be rolled on the sheet mills at much lower temperatures than employed in rolling steel sheet bars.

Fig. 3. Microphotographs of Armco ingot iron. $\times 100$. (a) Un-annealed, (b) properly annealed, (c) under annealed, (d) over annealed.

The use of the microscope plays a very important part in the final treatment of these commercially pure iron sheets, and special care is necessary in the annealing of the sheets in order that they may serve the purpose for which they are intended. Microphotographs of a sheet as rolled on the sheet mill show, first (see Fig. 3a) the elongated grains and then after proper annealing (see Fig. 3b) the rounded grain structure.

The microphotographs shown in Figs. 3c and d illustrate very clearly the effect of improper annealing upon the structure of the metal. The elongated grains of a sheet annealed near the bottom of the box (Fig. 3c) are due to either insufficient time or to low temperature. The coarse grains, free from strains, of the other microphotograph (Fig. 3d) illustrate the grain growth caused by annealing at too high a temperature.

IMPORTANT USES OF INGOT IRON

Having developed an open-hearth pure iron primarily for its rust-resisting properties, we were gratified to find upon further study that it had many other interesting and valuable qualities, which taken together make a metal for more general use than had been attained by any other ferrous sheet metal product.

The high purity of the metal finally attained is shown by the following average analysis: Si trace, S 0.035, P 0.005, C 0.13, Mn 0.021.

We have found that this pure iron galvanizes in a superior manner to steel. Exhaustive tests have shown that when various grades of steel are galvanized in the same pot and under exactly the same conditions as when galvanizing this pure iron not only will the pure iron take on a heavier coating, but this heavier coating will have less tendency to peel when the metal is fabricated.

We have learned that pure iron goes into solution in molten spelter more slowly than steel; and we have learned that pure iron flux boxes and gears which are immersed in molten spelter will outlast many times similar equipment made from steel. It has been determined by analysis that the iron content of the spelter on steel will average much higher than the iron content of the spelter on pure iron.

Believing that a ferrous metal of such high purity meant rust-resisting properties, we began the study of its behavior under general service conditions. For twelve years the metal has been tested under a great many laboratory and service conditions and the results which have been obtained indicate that it is suitable for many exacting needs where ordinary steel has not proved satisfactory.

The purity of this product and the careful methods used in its manufacture make it more homogeneous than steel, and it therefore flows uniformly when heated to a melting temperature. This characteristic led to its use for many purposes where the cost or efficiency of welded articles depended upon quality of the weld or ease of welding operations. The welding quality of commercially pure iron created a demand for this material in the form of welding wire and rods to such an extent that conversion arrangements were made for the manufacture of large quantities of commercially pure iron welding rods and wire. This material has already largely displaced the welding materials of foreign manufacture previously used in this country. Welding wire made from this metal is used for electric arc welding and gas welding. This iron when drawn into wire has a very low electrical resistance for a ferrous metal. Its conductivity is approximately 50

per cent greater than soft steel, or about 18 per cent of the conductivity of copper.

Another important use of this commercially pure iron lies in its excellent vitreous enameling properties. In the degasification of the metal in the open-hearth process the detrimental gases are practically eliminated. Enameled products made from this iron have a superior finish and are free from blisters, pinholes and other enameling defects.

The average analysis compiled from records covering a period of twelve months gives this iron a purity of 99.865 per cent. This takes into consideration the nine impurities—silicon, sulphur, phosphorus, carbon, manganese, copper, oxygen, hydrogen and nitrogen.

In addition to almost 200,000 tons of ingots which we produced in this country during the past year pure iron made in the open-hearth furnace is being produced abroad and used extensively in Norway and Sweden.

Heat-Treatment of Heavy Forgings

At a meeting of the Washington Chapter, American Society for Steel Treating, May 19, the heat-treatment of heavy locomotive and ordnance forgings was discussed by Lawford H. Fry, superintendent of product, Standard Steel Works, and P. E. McKinney, metallurgist, Washington Navy Yard.

General practice in quenching wristpins, axles, piston rods and connecting rods was described by Mr. Fry and results of experiments were given to show the effects of various quenching media on the properties of both large and small sections. The rate at which heat units are extracted per square inch of surface in quenching is the same for axles as for small test-pieces when using any one of the common commercial media. The hardening effect, however, does not depend upon the rate at which heat units are given up, but on the rate of temperature drop. The following average figures represent the number of heat units (B.t.u.) extracted per square inch of surface per minute by different quenching media:

Air	1.0
Heavy oil	2.7
Cutting compound	3.0
Light oil	3.6
Water	7.0

Vigorous circulation of the quenching bath not only cuts down the time of cooling but may result in superior physical properties.

The importance of "pre-natal" influences in successful heat-treatment of steel was especially emphasized by both speakers. The usual inspection reports covering condition of surface and chemical composition were characterized as inadequate in defining the quality of steel for high-grade forgings and a plea for more general and close scrutiny of melting and forging records by those engaged in heat-treatment was made by Mr. McKinney. Some of the factors having a serious bearing on the final heat-treated product are:

- Method used in refinement of steel.
- Metallurgical control of conditions of slag.
- Methods of introducing ferro-alloys, degasifying agents, etc.
- Condition of metal previous to tapping from furnace.
- Temperature of metal during refining and finishing.
- Size of nozzle used in teeming of ingots.
- Methods of pouring ingots.
- Size of ingot used for given purpose.
- Type of ingot used as regards chilling effect, etc.
- Rate of speed in pouring ingots.
- Temperature of metal entering the ingot.
- Shrinkage of the ingot on cooling.
- Behavior of the ingot during solidification.

The Hydrolysis of Fats by Reagents Made From Cymene

A Study of Fat Hydrolises Reagents of the Twitchell Type—Advantages of Cymene Compared With Benzene and Naphthalene—No Preliminary Acidification Required to Obtain Rapid Hydrolysis—Better Color of Products

BY RALPH H. MCKEE AND LELAND J. LEWIS

THE industrial importance of the sulphonic acids as fat-splitting reagents has become so generally recognized that a study of certain of these acids seemed to present a field for useful investigation. Reagents using benzene and naphthalene have been in general use for the past two decades, but heretofore cymene, as a constituent of this type of compound, has not been utilized.

This investigation of the cymene-stearosulphonic acid as a fat-splitting reagent of the Twitchell type was taken up, as it had been noticed that cymene sulphonic acid is soluble in hydrocarbons and oils as well as in water, that it is an excellent emulsifying agent and that it is more easily and cheaply made than most other sulphonic acids. It was thought that these properties indicated its applicability as a fat-hydrolyzing reagent or as a constituent, in cymene-stearosulphonic acid, of a new Twitchell type fat-hydrolyzing reagent.¹

ADVANTAGES OF CYMENE

This investigation using cymene as a constituent of a fat-splitting reagent of the Twitchell type shows that it possesses the following advantages over the reagents at present employed commercially:

That it is more easily made than the reagents using naphthalene and benzene.

That the reagent can be made at least as cheaply as other reagents on the market.

That a uniform product can be obtained under different conditions of sulphonation.

That the fats and oils are split into fatty acids and glycerine more readily.

That the fatty acid resulting from the splitting of the fat or oil is of a lighter color and hence better.

That the crude glycerine can be produced of better quality.

TWITCHELL REAGENT

The type of reagent used commercially was discovered by Dr. Ernst Twitchell of Wyoming, Ohio, who found that aromatic hydrocarbons such as benzene and naphthalene mixed with oleic acid could be sulphonated to form compounds which fulfilled the commercial conditions requisite for fat-splitting reagents.² He writes the following equation when benzene and oleic acid are acted upon by sulphuric acid:

He gives this compound the name of benzene-stearosulphonic acid. This nomenclature is based on the assumption that the oleic acid part, which is unsaturated at the start, has become a saturated radical when the

reaction is completed. However, there is little definite evidence bearing on the character of the linking between oleic acid and the rest of the molecule.

PREPARATION OF REAGENT FROM CYMENE³

Cymene, methyl isopropyl benzene, is a byproduct from the manufacture of sulphite pulp from spruce wood. The crude product was purified in the laboratory by one steam distillation and two dry distillations, giving a colorless liquid with a boiling point 174-176 deg. C.

Two hundred and eighty grams of oleic acid and 140 g. of cymene were stirred by a motor-driven (550 r.p.m.) glass propeller; 300 g. of sulphuric acid (66 deg. Bé.) was added gradually, care being taken to keep the temperature below 35 deg. C. The sulphonation was carried out in a beaker.

The stirrer was made of a glass rod with the end of the rod bent up making an angle to the main rod of 45 deg. This end was flattened in order that the blade part of the stirrer would have a lifting effect on the liquid. Experiments carried out with this simple type of stirrer showed it to have a marked effect on the ease with which sulphonation was effected. This is in line with observations made by McKee,⁴ who demonstrated that the speed of sulphonation is dependent in part upon the character of the stirring.

As the sulphonation was carried on at 30 to 35 deg. C., it was necessary for the reaction to proceed for a fairly long period. After twenty-four hours' stirring, 500 c.c. of distilled water was added and the whole brought to a boil and stirred. This accomplishes two things: It greatly dilutes the excess of sulphuric acid present in the mixture and it breaks up any oxystearic acid esters⁵ that are formed when sulphuric acid acts upon the oleic acid.

The decomposition into oxystearic acid of the oxystearic acid esters is practically complete after the product has been boiling for twenty minutes.⁶ The upper layer which separated on standing was a viscous, dark brown, oily mass and contained the cymene-stearosulphonic acid and any unchanged oleic acid or cymene. The lower layer consisted of the diluted excess sulphuric acid together with a small amount of cymene sulphonic acid. As this is soluble in dilute sulphuric acid, it was discarded with the sulphuric acid. The resulting product is pure enough for use commercially, but for exact work such as the present research purer products should be used.

The purification of the cymene-stearosulphonic acid can readily be accomplished, as it is insoluble in water

¹U. S. Patent Application, Serial No. 461,387.

²Reagents of the Twitchell type are also in use where both the aromatic and fatty acid constituents have been modified. See U. S. Pat. 1,303,779 to R. E. Devine and the Pfeilring reagent, *Seifenfabr.*, vol. 38, p. 425 (1918).

³Method of preparation is similar to that described by Twitchell: U. S. Pat. 601,603, March 29, 1898; and 628,503, July 11, 1899. *J. Am. Chem. Soc.*, vol. 22, p. 22 (1900).

⁴*Science*, vol. 35, p. 388 (1912).

⁵Lewkowitsch, vol. I, p. 225. Edition of 1913.

⁶Twitchell, *loc. cit.*

containing a strong electrolyte of the type of dilute sulphuric or hydrochloric acid and insoluble in petroleum ether or gasoline, while the impurities are extracted by these solvents.

The crude reagent was agitated with 200 c.c. of 2 per cent hydrochloric acid, brought to the boil and then allowed to stand. The lower layer was again removed. This process was repeated three times. The water from the fourth washing was tested with barium chloride solution and found to be free from sulphuric acid.

To remove the organic impurities petroleum ether was agitated with the oily layer. The petroleum ether separated as an upper layer of a brownish color and contained in solution oxystearic acid and unchanged oleic acid as well as cymene. This extraction was repeated three times. The last ether washing was only slightly colored and when a portion of it was evaporated on a watch glass it left but a faint stain.

As presumably all of the foreign bodies not removed by the washing with water are soluble in petroleum ether, it follows that the product obtained was cymene-stearosulphonic acid containing small amounts of water, hydrochloric acid and petroleum ether. Accordingly it was placed in an open dish on a water bath and stirred continuously for twenty-four hours. A test of a portion, by dissolving in water and adding silver nitrate solution, showed the absence of hydrochloric acid, and presumably water and petroleum ether had likewise been driven off.

TESTING THE REAGENT

The product was further tested for purity by determining its sulphur content and its acidity. The sulphur was determined by converting the sulphur into sulphuric acid by burning in an Emerson bomb calorimeter and converting the sulphuric acid so formed into barium sulphate.

Average per cent sulphur found in three determinations, 6.6 per cent. Per cent sulphur calculated for $C_{10}H_{12}(HSO_3)C_{18}H_{35}O_2$ is 6.4 per cent. Considering the character of the material, a closer check was not expected.

If we accept the empirical formulas of the aromatic stearosulphonic acids as given by Twitchell, a compound of the formula $C_{10}H_{12}(HSO_3)C_{18}H_{35}O_2$ would have a molecular weight of 496. Moreover this acid is dibasic. Twitchell also shows that methylorange indicates about half of the acidity, that caused by the sulphonic acid group, and that phenolphthalein neutrality corresponds to the total acidity. A 2 per cent solution therefore should be 0.0806 normal to phenolphthalein. Titrations with standard alkali of a carefully made 2 per cent solution indicated a purity of 99 per cent when phenolphthalein was used as an indicator.

For comparison the standard Twitchell reagents, naphthalene and benzene-stearosulphonic acids, were made and purified in the manner described above and the sulphur and acid values similarly determined. For naphthalene-stearosulphonic acid the per cent of sulphur found was 6.62; calculated for complete purity, 6.54 per cent. Titration gave a normality of 0.0805, while that calculated from the weight taken was 0.0812. Similarly for benzene-stearosulphonic acid 7.4 per cent sulphur was found, as contrasted with 7.3 per cent by calculation. By titration a normality of the 2 per cent solution was 0.0904, as compared to the calculated 0.0911 normality.

Benzene-stearosulphonic acid and cymene-stearosulphonic acid were also made by a slightly modified process where the sulphonation took place at 98 deg. To prepare the cymene-stearosulphonic acid the oleic acid and cymene were sulphonated with 66 deg. Bé. sulphuric acid, using a steam-jacketed enameled kettle. Time, four hours. The product was purified by washing as previously described. The benzene derivative was made and purified in the same way.

Both benzene-stearosulphonic acid and cymene-stearosulphonic acid were dark. However, the cymene-stearosulphonic acid was not carbonized, as it gave a clear yellow solution with dilute sodium hydroxide. The benzene-stearosulphonic acid showed some carbonization. The acid values of benzene-stearosulphonic acid were almost identical with the corresponding reagents made by cold sulphonation. It will later be shown that these products made by hot sulphonation were identical with the corresponding reagents made by sulphonation at 35 deg. C. when tested by being used in the hydrolysis of cottonseed oil.

Cymene sulphonic acid was prepared by adding 24 c.c. of normal sulphuric acid to 3 g. of calcium cymene sulphonate in solution. The filtrate and washings were taken as a reagent to saponify 300 g. of cottonseed oil.

In addition to the six reagents made as described, there was used a seventh reagent, taken from a sample furnished by a soap factory using the Twitchell process.'

DETERMINATION OF THE SPEEDS OF HYDROLYSIS

The hydrolyses were carried on in 1,000-c.c. pyrex beakers. The heat was supplied by electric hot-plates. The agitation was produced by a stirring device similar to that described above. The cottonseed oil used for

FIG. 1. HYDROLYSIS OF COTTONSEED OIL WITH 1 PER CENT FAT HYDROLYZING REAGENTS WITHOUT H_2SO_4 .

1—"Kontakt" reagent. 2—Cymene sulphonic acid. 3—Benzene stearosulphonic acid (hot sulphonation). 4—Benzene stearosulphonic acid (cold sulphonation). 5—Naphthalene stearosulphonic acid. 6—Cymene stearosulphonic acid (cold sulphonation). 7—Cymene stearosulphonic acid (hot sulphonation).

the hydrolysis tests was a refined commercial oil of light yellow color having a saponification number of 194 and an acid number of 0.5.

Seven 300-g. samples were taken, and to each sample was added 300 c.c. of distilled water. In each case the weight of the reagent was taken, which was 1 per cent of the weight of the fat. The temperatures were kept almost constant around 98 deg. C. At the end of a 2-hr. run the contents of the beakers were allowed to stand a few minutes in order that a sample

"Kontakt reagent," furnished through the kindness of Dr. Ittner of Colgate & Co.

free from emulsion could be taken. The acid number of each oil sample was determined after the method of Sherman,⁸ and from this number the per cent of saponification was calculated. Reagents used:

1. "Kontakt reagent," a commercial reagent.
2. Cymene sulphonic acid. (From calcium cymene sulphonate.)
3. Benzene-stearosulphonic acid. (Hot sulphonation.)
4. Benzene-stearosulphonic acid. (Cold sulphonation.)
5. Naphthalene-stearosulphonic acid. (Cold sulphonation.)
6. Cymene-stearosulphonic acid. (Cold sulphonation.)
7. Cymene-stearosulphonic acid. (Hot sulphonation.)

COMPARISON OF RATES OF HYDROLYSIS WITHOUT SULPHURIC TREATMENT

The rates of hydrolysis are shown in the form of curves in Fig. 1. It is apparent that cymene-stearosulphonic acid to the strength of 1 per cent of the

FIG. 2. HYDROLYSIS OF COTTONSEED OIL

Hydrolyzing reagents used: 1—Benzene stearosulphonic acid. 2—Benzene stearosulphonic acid (with H_2SO_4 treatment). 3—Cymene stearosulphonic acid. 4—Cymene stearosulphonic acid. 5—"Kontakt" reagent. 6—Cymene stearosulphonic acid.

weight of cottonseed oil works without the usual sulphuric acid addition, but that the standard commercial hydrolyzing reagents do not work efficiently without sulphuric acid solution. It might be claimed that the method of experiment is scarcely fair to the standard Twitchell type of reagents, as they have been found to work best after the oil or fat has been heated for several hours with dilute sulphuric acid. It is also to be noted that there is but slight difference observed between the acids prepared by cold and hot sulphonation.

COMPARISON WITH SULPHURIC TREATMENT

The data given below are for another series of experiments where the reagents are compared under parallel conditions with cottonseed oil again, but in the presence of a small amount of sulphuric acid, except in the sixth experiment.

Benzene-stearosulphonic acid (hot sulphonation) to an amount of $\frac{1}{2}$ per cent of the weight of the oil. One-fifth per cent by weight of sulphuric acid was added. After the twelfth hour the concentration of the benzene-stearosulphonic acid increased to 1 per cent.

Benzene-stearosulphonic acid. The same reagent and in the same amount as above, but the oil heated to boiling for half an hour with 30 c.c. of 2 per cent sulphuric acid before the reagent was added. This preheating is a step often used commercially.

Cymene-stearosulphonic acid. One-half per cent of the reagent was used together with $\frac{1}{2}$ per cent of sulphuric acid. After the twenty-sixth hour the concen-

tration of the cymene-stearosulphonic acid was increased to 1 per cent.

Cymene-stearosulphonic acid. The same reagent as above with the same amounts of the reagent at the start. After six hours' run the concentration of the cymene-stearosulphonic acid was increased to 1 per cent.

"Kontakt reagent." The concentration of the reagent and of the sulphuric acid at the start were the same as those for the other reagents, but after twenty-four hours' run these were increased to $1\frac{1}{2}$ per cent of the reagent and $1\frac{1}{2}$ per cent of the sulphuric acid.

Cymene-stearosulphonic acid. The hydrolysis of the partly hydrolyzed oil in the previous experiment was continued. The glycerine water was removed at the twentieth hour when the hydrolysis was 65 per cent complete and 1 per cent more of the reagent was added. No sulphuric acid was used.

The results are given in the form of curves in Fig. 2.

CHARACTERISTICS OF THE CYMENE REAGENT

In comparing the rates of hydrolysis of cottonseed oil hydrolyzed by cymene-stearosulphonic acid and certain other reagents, it was noted that the cottonseed oil could be hydrolyzed with 1 per cent of its weight of the cymene-stearosulphonic acid without the addition of sulphuric acid or without resorting to sulphuric acid treatment of the oil. It seemed an important point to determine to what extent the concentration of the cymene-stearosulphonic acid could be reduced and still effect the hydrolysis of the oil. When $\frac{1}{4}$ per cent of the cymene-stearosulphonic acid and 1 per cent of the sulphuric acid are added to cottonseed oil and an equal weight of water, the acid concentration shown by titration is more than twice the concentration that was used when the oil was readily hydrolyzed. But when this concentration was used practically no hydrolytic splitting of the oil took place. When the concentration of the cymene-stearosulphonic acid was doubled, 0.5 per cent, and the sulphuric acid retained at 1 per cent, the rate of the hydrolysis was very rapid; 25 per cent of the oil was hydrolyzed in two hours, 67 per cent in three hours and 87 per cent in five hours. When a weight of cymene-stearosulphonic acid equivalent to $\frac{1}{4}$ per cent of the weight of the oil was used and no sulphuric acid added, the rate of hydrolysis was very slow, but was far more rapid than in the above experiment, where $\frac{1}{4}$ per cent of the reagent was used with 1 per cent of the sulphuric acid.

The great effect of doubling the concentration of the reagent after six hours is shown in the following experiment.

One-half gram cymene-stearosulphonic acid for six hours, $\frac{1}{2}$ g. added at the end of six hours' run. One hundred grams of cottonseed oil used and as usual an equal weight of water: Two hours, 0.5 per cent; six hours, 1.2 ($\frac{1}{2}$ per cent reagent added); eight hours, 10.0; twelve hours, 34.5; sixteen hours, 57.4; twenty-two hours, 86.7.

The fatty layer separated much more readily at the eight-hour and later periods than at the close of the two- and six-hour periods.

The above experimental work leads to the following conclusions so far as cottonseed oil is concerned. Later work indicates that they apply as well to other fats as to cottonseed oil:

In the absence of sulphuric acid the new reagent, cymene-stearosulphonic acid, is much more efficient as

⁸Organic Analysis, p. 147. Edition of 1912.

a hydrolyzing reagent than the commercial reagents commonly used.

A certain minimum percentage of reagent is necessary to bring about hydrolysis at a rate that obtains for commercial efficiency—e.g., $\frac{1}{2}$ per cent of the new reagent based on the weight of the fat taken in the presence of sulphuric acid or between $\frac{1}{2}$ and 1 per cent of the new reagent in the absence of sulphuric acid.

In the presence of $\frac{1}{2}$ per cent of sulphuric acid the new reagent is somewhat more effective than two reagents (benzene-stearosulphonic acid and "Kontakt reagent") now used commercially.

COMPARATIVE TEST ON COCONUT OIL

In order to gain further information as to the respective merits of the two reagents named, previous experiments (*cf.* Fig. 1) seemingly having indicated that the naphthalene compound was somewhat the better of the commercially used reagents, the time factors in the hydrolysis of coconut oil and later in the hydrolysis of tallow were obtained. The coconut oil⁹ used in these experiments had a saponification number of 268 and an acid number of 0.6.

For these comparisons 300 g. of the coconut oil was hydrolyzed with $\frac{1}{2}$ per cent of the reagents and 1 per cent of sulphuric acid. The volume of distilled water was kept as nearly as possible equal to that of the fat. The temperatures were maintained almost constant at 98 deg. C. The data in Fig. 3, curves II and IV, give the comparisons of the speeds of hydrolysis for cymene-stearosulphonic acid and commercial naphthalene-stearosulphonic acid.¹⁰

From the data given above it is obvious that the coconut oil is much more readily hydrolyzed than the

FIG. 3. HYDROLYSIS OF COCONUT OIL

Hydrolyzing reagents used: I—Cymene steorosulphonic acid 1 per cent, H_2SO_4 1 per cent. II—Cymene steorosulphonic acid $\frac{1}{2}$ per cent, H_2SO_4 $\frac{1}{2}$ per cent. cottonseed oil. One-half per cent of reagent was effective in bringing about hydrolysis without a previous sulphuric acid treatment, while in the cottonseed oil $\frac{1}{2}$ per cent of the reagents seemed to be too small a quantity to effect a ready hydrolysis. The speeds of hydrolysis were greatly increased when the concentrations of each reagent were doubled and the concentration of the sulphuric acid remained constant.

In comparing the hydrolysis of the reagents, it will be noted that the hydrolysis of the oil was more readily

effected with the cymene reagent than with the commercial reagent made from naphthalene and that the difference in this respect was in the neighborhood of 8 to 10 per cent. The fatty acids and the glycerine water obtained where the cymene-stearosulphonic acid was used were of lighter color than these same products obtained by the commercial reagent.

Comparison of the speeds of hydrolysis of coconut oil with 1 per cent cymene-stearosulphonic acid and commercial naphthalene-stearosulphonic acid: 300 g. coconut oil, 300 g. water, 3 g. cymene-stearosulphonic acid

FIG. 4. HYDROLYSIS OF A SOAP GRADE TALLOW

I—Cymene steorosulphonic acid 1 per cent, H_2SO_4 1 per cent. II—Cymene steorosulphonic acid $\frac{1}{2}$ per cent, H_2SO_4 $\frac{1}{2}$ per cent. (1 per cent), 3 g. sulphuric acid (1 per cent); 300 g. coconut oil, 300 g. water, 3 g. commercial naphthalene-stearosulphonic acid (1 per cent), 3 g. sulphuric acid (1 per cent). See Fig. 3, curves I and III. At the tenth hour glycerine water was removed and $\frac{1}{2}$ per cent reagent and 1 per cent sulphuric acid added.

Curves II and IV of Fig. 4 give a comparison of the speeds of hydrolysis of tallow with cymene-stearosulphonic acid and with commercial naphthalene-stearosulphonic acid. The tallow¹¹ was a commercial soap grade product which contained 18.5 per cent of free fatty acid. At the nineteenth hour the glycerine water was removed and $\frac{1}{2}$ per cent reagent and 1 per cent sulphuric acid added: 300 g. tallow, 300 g. water and $1\frac{1}{2}$ g. commercial naphthalene-stearosulphonic acid ($\frac{1}{2}$ per cent), 3 g. sulphuric acid (1 per cent); 300 g. tallow, 300 g. water, $1\frac{1}{2}$ g. cymene-stearosulphonic acid ($\frac{1}{2}$ per cent), 3 g. sulphuric acid (1 per cent).

Comparison of the speeds of hydrolysis of soap grade tallow with 1 per cent instead of $\frac{1}{2}$ per cent cymene-stearosulphonic acid and with commercial naphthalene-stearosulphonic acid in the presence of 1 per cent sulphuric acid are given by curves I and III of Fig. 4: 300 g. soap grade tallow, 300 g. water, 3 g. cymene-stearosulphonic acid (1 per cent), 3 g. sulphuric acid (1 per cent); 300 g. soap grade tallow, 300 g. water, 3 g. commercial naphthalene-stearosulphonic acid (1 per cent), 3 g. sulphuric acid.

At the tenth hour glycerine water was removed and $\frac{1}{2}$ per cent reagent and 1 per cent sulphuric acid added.

The reagents at both concentrations were effective in bringing about hydrolysis and the cymene-stearosul-

⁹The coconut oil was obtained from Kirkman & Son through the kindness of Mr. Lyford.

¹⁰Sample of reagent received through the kindness of Dr. Twitchell as a typical saponification reagent. Analysis showed a purity of 92.9 per cent based on the calculated acid value.

¹¹A typical soap grade tallow obtained from Kirkman & Son through the kindness of Mr. Lyford.

phonic acid held about the same margin of advantage over the commercial reagent as was shown in the comparison of the speeds of hydrolysis on the coconut oil.

Unlike the hydrolysis in the case of cottonseed oil, which was very slow at the start and which gained speed until nearly 50 per cent was hydrolyzed, with the tallow the hydrolysis was most rapid at the start and the speed fell off as it approached 70 per cent hydrolysis. This would seem to indicate that the free fatty acid present in the tallow at the start was a factor in accounting for the difference in the two reactions. This factor will be discussed more fully in a later section of the paper.

THE DARKENING EFFECT PRODUCED IN THE FATTY ACIDS DURING HYDROLYSIS

The difficulty of producing light-colored fatty acids with reagents of the Twitchell type is one of the most serious drawbacks to the process. In plant practice the utmost care is exercised in excluding air from the fat undergoing hydrolysis until the saponification is complete and the acid neutralized. The darkening of the fatty acid is supposed to be due in part at least to the oxygen in the air. This, while it is the general belief in the plants, needs confirmation.

The color of the fatty acids from parallel runs made in an open vessel with the same concentration of various reagents discussed in previous pages showed wide differences in color. The lightest-colored fatty acids were obtained with cymene-stearosulphonic acid. The curves in Figs. 5 and 6 are from data obtained in comparing the color changes of the fatty acids from coconut oil and from cottonseed oil. A Lovibond tintometer was used to measure the degree of color. The darkening of the fatty acids when the new cymene reagent was used was only about half as great as when commercial reagents were used to effect hydrolysis.

The table gives the color numbers for fatty acids obtained by the three reagents in question. The cell in which the color of the initial and partly hydrolyzed oil was measured was 1 cm. in thickness.

Hydrolyzing Reagent Used	Initial Color of Coconut Oil		At 30 Per Cent Hydrolysis		At 95 Per Cent Hydrolysis

CONDITIONS GOVERNING HYDROLYSIS OF FATS AND OILS

While no special attempt was made to determine the ultimate cause of fat splitting by such compounds as cymene-stearosulphonic acid, naphthalene-stearosulphonic acid and benzene-stearosulphonic acid, some observations were made which will be discussed in a

brief review of the several theories on the action of the sulphonic acids in effecting cleavage of fats.

In his Perkin Medal address¹² Twitchell states that even before the discovery of his first catalyst he had stated what properties such a catalyst should possess. These were, namely, that the catalyst should be able to furnish a high hydrogen ion concentration when added

FIG. 5. COLOR CHANGE OF FATTY ACIDS IN COCONUT OIL, MEASURED WITH A LOVIBOND TINTOMETER

Hydrolyzing reagents used: A—Cymene stearosulphonic acid. B—"Kontakt" reagent. C—Naphthalene stearosulphonic acid (commercial).

to a fat and water and in the second place it should be soluble in the fat and soluble in water. Furthermore the reagent must be stable at the temperatures that obtain during the hydrolysis of fat.

The acids benzene-stearosulphonic, naphthalene-stearosulphonic and cymene-stearosulphonic are apparently all dibasic acids dissociating readily in water. One of these acid hydrogens can be approximately determined by titrating against standard alkali using methyl orange as indicator. If phenolphthalein is used as the indicator, both acid hydrogen atoms react and

the entire acidity becomes apparent. Tests have shown that they also all meet the other requirements mentioned by Dr. Twitchell, though in somewhat varying degree.

ACTION OF REAGENT

The explanation by Twitchell¹³ for the cause of the catalytic action of the sulpho fatty aromatic acids is in substance that water becomes a solvent for a

¹²J. Ind. Eng. Chem., vol. 9, p. 194 (1917).

¹³J. Am. Chem. Soc., vol. 22, p. 22 (1900).

glyceride when it contains one of these acids. He points out the fact that esters which are soluble in water are easily hydrolyzed by an acid, while those which are practically insoluble in water are hydrolyzed with great difficulty or are not hydrolyzed at all.

There are, however, a number of cases where water-insoluble glycerides are readily hydrolyzed in a relatively weak acid solution and it would seem that the proof is not conclusive that the rate of decomposition of an ester depends upon the solubility in water. Lewkowitsch¹⁴ has shown that tallow (a water-insoluble glyceride) can be hydrolyzed with 4 per cent of sulphuric acid in nine hours at a temperature of 120 deg. C. Furthermore, the autoclave process for decomposing water-insoluble glycerides does not employ reagents which render the fat or oil soluble in water. Examples of this kind seem to indicate that emulsion formation is the necessary step toward hydrolysis and that the solubility of the reagent in both water and oil phases determines the degree of emulsion formation. On this assumption it seemed important to carry out some experiments to determine if possible the factors that assist in emulsion formation and also to ascertain what changes take place in the water phase during a hydrolysis of a fat.

DISTRIBUTION OF REAGENT

Determinations were made to find the distribution of reagent in oil and in water when the proportions of the constituents were about the same as obtains in industrial practice.

The first experiments were carried out with a neutral coconut oil. Two hundred grams of oil and 100 c.c. of a standard solution (10 c.c. equivalent to 53.80 c.c. N/100 NaOH) of cymene-stearosulphonic acid were agitated in a beaker for thirty minutes at 25 deg. C. This emulsion so formed was allowed to stand for one hour. Ten-c.c. portions of the water phase were titrated with N/100 NaOH using phenolphthalein. A difference in the amounts of NaOH required for 10-c.c. portions and of the NaOH required to neutralize 10 c.c. of the original acid solution added gave the amount of the acid which passed from the water phase to the oil phase. Titrations were each made in triplicate using phenolphthalein indicator and the average was taken for calculations.

Ten c.c. of the original acid required 53.80 c.c. N/100 NaOH. Ten c.c. of the water layer after treatment required 51.70 c.c. N/100 NaOH. The acid strength remaining is $51.70 \div 53.80 = 96.1$ per cent. Reagent which passed from the water phase under conditions described above, $100 - 96.1 = 3.9$ per cent at 25 deg. When the experiment was repeated at 60 deg. C., it was found that 8.02 per cent had left the water phase.

Since the presence of fatty acids seemed to increase the speed of hydrolysis in an oil, the above experiments were repeated using 180 g. of coconut oil with 20 g. of oleic acid, the concentration of the reagent remaining the same. It was found that in the presence of oleic acid 5.4 per cent left the water phase at 25 deg. and 11.0 per cent at 60 deg. Accordingly the presence of free fatty acid in the fat or oil serves to make it a better solvent for the hydrolyzing reagent.

A second set of experiments was made with cottonseed oil instead of coconut oil and gave similar results. At 25 deg. 4.2 per cent and at 60 deg. 7.5 per cent of

the acid left the water phase. In the presence of oleic acid in the same proportion as with the cottonseed oil it was found that at 25 deg. 5.9 per cent and at 60 deg. 11.0 per cent of the reagent acid left the water phase.

INCREASE IN IONIZATION

In the light of this work it is apparent that one function of the sulphuric acid is to decrease ionization of the reagent and thereby increase the solubility of the reagent in the oil phase. It is apparent in the above set of experiments that the solubility of the reagent in the oil and fatty acid increases as the temperature rises. Some measurements carried out at a temperature of 98 deg. C. showed that the increase in solubility was apparently a straight line function and that at a temperature which obtains when fats and oils are split by the use of hydrolyzing reagents, 10 per cent or more of the reagent is dissolved in a neutral fat and 10 to 20 per cent (depending on the per cent of fatty acid present) is dissolved in fat containing fatty acid or in a fat after hydrolysis has proceeded for a few hours.

The results obtained at 98 deg. C. were variable and not entirely trustworthy because at that temperature the glycerides were broken up into fatty acids and glycerine and the composition of the original substance was changed. At 25 and 60 deg. the hydrolysis which the oil suffered during one-half hour was almost negligible and the values obtained at these temperatures will indicate approximately how the acid is divided between oil and water phases. This is not true at 98 deg. C.

DISTRIBUTION OF THE ACID

The whole amount of acid which leaves the water phase is not dissolved in the fat to form a homogeneous solution. Part of the acid dissolves in the fat and part forms emulsions which persist for a considerable length of time when the fat and the acid are allowed to remain quiet.

When water extractions of the unemulsified oil were made and were titrated against the standard sodium hydroxide, the acid found did not correspond to the amount which left the water phase. When a layer of emulsion between the fat and water phases seemed to persist on standing, this difference between acid lost in the water phase and acid dissolved in the oil phase was greater than when almost no emulsion was present. It is the opinion of the writers that the solution of the acid has its greatest concentration at the interface between acid solution and fat and that the greater the degree of dispersion of the oil particles in this area the greater will be the concentration of the acid.

EFFECT OF ACID ON REAGENT DISTRIBUTION

Supplementary experiments were carried out in the determination of the distribution of cymene-stearosulphonic acid in the water and oil phases. In these an attempt was made to determine what, if any, effect sulphuric acid had toward driving the reagent from the water phase into the oil phase. Using approximately normal sulphuric acid and the same strength of reagent acid as before, it was found at 25 deg. with cottonseed oil 6.8 per cent of the cymene-stearosulphonic acid left the water phase and with coconut oil 8.7 per cent left the water phase. These values are roughly one and a half to two times the solubility of the hydrolyzing reagent in these oils at 25 deg. when no sulphuric acid was present.

¹⁴Lewkowitsch, *Chemical Technology of the Oils, Fats and Waxes*, vol. 1, p. 84. Edition of 1913.

With increase of temperature the percentage of ionization of dilute sulphuric acid changes but little. With increase of temperature the fat hydrolyzing reagent has been shown to be much more soluble in the fat. Accordingly we would expect the presence of sulphuric acid to be particularly effective in increasing the percentage solubility of the hydrolyzing reagent at higher temperatures. Unfortunately, as explained above, it is not practical to make such determinations at the hydrolyzing temperature.

ESSENTIAL CONDITIONS

It may be necessary, then, to bring about two conditions before an acid will hydrolyze a fat:

The hydrogen ions must be greatly concentrated on the surface of a fat globule.

The fat must be divided until the surface is extremely large in comparison to the mass of the particle to be hydrolyzed.

Nernst¹⁵ states that the hydroxyl ion is 1,400 times more effective than the hydrogen ion in causing saponification. A N/5 solution of sodium hydroxide has practically no action on a neutral fat at room temperature, for a fatty acid can be determined in the presence of a neutral fat by neutralizing the fatty acid in an alcohol water solution with this strength alkali. If the relative activity of the hydrogen and hydroxyl ions in causing saponification is 1 to 1,400, it is obvious that a very extraordinary set of conditions must exist when a fat is hydrolyzed by an acid saponifying reagent of the type that we are studying. In this case a solution of an acid less than N/10 concentration can bring about the rapid hydrolysis of a fat.

Experiments carried out in the laboratory showed that a fat in the form of an emulsion is very much more readily acted upon by an alkali than one which is not in this form. The separation of fat bodies into smaller ones will increase the surface enormously and in this respect it would seem that the speed of hydrolysis¹⁶ is largely determined by the degree of the divisibility of the body that is undergoing hydrolysis.

The presence of a small per cent of free fatty acid seems to aid in the formation of emulsion. It was observed that the addition of oleic acid to a fat undergoing hydrolysis increased its tendency to form an emulsion layer between the fat and water, as was evident from the depth of the layer after the agitation was stopped. This emulsion layer was fairly stable on standing. As shown above, the per cent of acid leaving the water phase was increased when oleic acid was added and when the temperature was raised. In a separate experiment using oleic acid as a solvent it was shown that the sulpho-fatty aromatic acids are taken from the water phase to form true solutions in the fatty layer and in particular in the fat containing fatty acid, also that a considerable part of the reagent goes into the emulsion which is formed. It was further observed that the tendency for the formation of a stable emulsion did not appreciably increase after the fatty acid increased beyond about 10 per cent.

From an examination of the curves on the rate of hydrolysis of cottonseed oil and coconut oil which contained no fatty acids at the start, it will be seen that the speed of hydrolysis was slow at the beginning of the reaction, but increased after fatty acids were formed. The speed after about 40 per cent of the

fat was converted into fatty acids fell off gradually. In the hydrolysis of a tallow which contained 18 per cent fatty acids the speed was the most rapid at the beginning of the hydrolysis.

The fact that an emulsification produced by the various types of fatty acids plays a great part in producing the hydrolysis of the glyceride is in harmony with some recent theories advanced on the nature of emulsifying agents. Harkins, Davis and Clark¹⁷ think that the best emulsifying agents have long molecules with a polar active group at one end of the molecule. (Polar groups COOR—COOH, etc.) For the emulsified particle to be stable the molecules which make the transition from the interior of the drop to the dispersion medium or the molecules of the "film" should fit the drop. Langmuir¹⁸ believes that the organic groups strike inward into the fatty globules while the COOH, SO₃H, etc., are outside in the water phase.

These theories on emulsification may explain why reagents like naphthalene-stearosulphonic acid and cymene-stearosulphonic acid are better hydrolyzing agents than benzene-stearosulphonic acid. If we accept as true the common structural formulas for benzene, naphthalene and cymene, the molecule of a compound like benzene-stearosulphonic acid would not possess the length that is found in the two others and it would therefore be less effective as an emulsifying agent.

In one series of experiments the fat hydrolysis was carried out in the presence of iron. It was found that the percentage hydrolysis was not nearly as high as parallel experiments carried out where glass replaced the iron and also that the surface of the iron had been corroded. It is the general belief in the industry that the presence of iron pipes, etc., in the wood hydrolyzing vat is objectionable both from the effect on the speed of hydrolysis and on the color of the resulting fatty acid. The present case is, however, so far as we know the first case where definite experiments to confirm this general belief have been made.

COST OF REAGENT

In comparing the merits of cymene-stearosulphonic acid with other hydrolyzing reagents, it is necessary to consider cost of materials and other expense arising from the preparation of these.

The raw materials in question are cymene, benzene, naphthalene, oleic acid and 66 Bé. sulphuric acid. Cymene can be purchased and refined at less cost than benzene or naphthalene. The market quotation for benzene of a suitable grade for hydrolyzing purposes is in the neighborhood of 30c. per gal., or about 4c. per lb., and naphthalene is 8c. to 9c. per lb. Cymene can be procured and purified for about 4c. per lb. Oleic acid of a grade desired for this work costs 7c. to 8c. per lb. Sulphuric acid costs approximately \$20 a ton.

On this basis crude cymene-stearosulphonic acid should be prepared in quantity at a cost of about 10c. per lb., the exact cost depending on the care one wishes to take in removing the excess of impurities that are formed or exist in the making of the reagent.

The cost of preparing the benzene or naphthalene compounds would be somewhat higher due to the higher cost of the hydrocarbon and also to the fact that they cannot be sulphonated with the same ease or completeness as can cymene.

Season-Cracking of Brass*

Extensive Observation of Season-Cracked Articles Led to Studies of the Action of Corrosive Agents on Stressed Brasses and a Determination of the Minimum Loads Required to Produce Corrosion Cracks—Chemical Action Held to Be Necessary for Season-Cracking

BY H. MOORE, S. BECKINSALE AND CLARICE E. MALLINSON

Research Department, Woolwich Arsenal, England

INFORMATION contained in this very comprehensive and voluminous paper is the result of studies extending over several years, and on a number of different non-ferrous alloys which have failed by season-cracking. Not all of the information is new, by any means; but the paper as a whole is a good presentation of the entire subject.

OBSERVATIONS ON SEASON-CRACKING

Failures in cups spun from a 70:30 brass sheet, 0.07 in. thick (Fig. 1) were first noted. These cups had been covered by a layer of lacquer, which in many cases was unbroken, and the broken metal showed no corrosion whatever. However, they were stored near a mixture

FIG. 1. SPUN VESSEL, 70:30 BRASS, SHOWING SEASON-CRACKS

of materials containing ammonium salts. When examined under the microscope, the metal showed a normal alpha brass structure, and all the cracks examined were intercrystalline. Internal stresses existed in these cups, since strips cut from them spring out of shape.

Empty cartridge cases (Figs. 2 and 3) especially have been affected with this "disease." Cracks usually occur

FIG. 2. SEASON-CRACKS IN INTERIOR OF WALL OF CARTRIDGE CASE

in the wall near the flange, and are ordinarily ascribed to incorrect "heading." After the shell has been placed in position, many longitudinal cracks have developed in the neck of the case. Fig. 4 shows the microscopic appearance of a typical crack in such a case made of 70:30 brass. Rings cut from such a cartridge would

show that the wall was in tension and the base in compression. Microscopic examination shows no distinguishing feature associated with season-cracking, such as crystal size, marked deformation in a crystal or the contour of crystalline boundaries.

A nickel-plated motor horn (Fig. 5) cracked badly where the plating had been polished off. Stress measurements from rings cut from this piece showed the cracks to start in rings having from 22,000 to 17,000 lb. per sq.in. stress, extending themselves toward regions having less stress.

Cold-drawn rods and tubes of various compositions ranging from pure alpha brass through mixtures of alpha and beta to pure beta brass have suffered high losses after storing. Particularly it was found that cold weather following a mild spell would be followed by much damage. Such weather conditions condense moisture on stored tubes, slightly corroding them, thus inducing cracking which exists chiefly in corroded regions. Under the microscope selective corrosion is

FIG. 3. SEASON-CRACKS IN BASE AND WALL OF CARTRIDGE CASE

very noticeable in the beta portion of a compound structure (Fig. 6). It was frequently noted that corrosive discoloration followed down the cracks. On the other hand inclusions were rarely connected with cracks, nor could preference be found for any shape, size or marking in the metallic grains. It was also possible to induce further cracking, in all bars which cracked in storage, by a light pickling followed by an immersion in weak mercurous nitrate. Failures coincided with scorings or surface defects in very rare instances—in fact, this observation applies to all the specimens examined during several years. Using Heyn's method of measuring internal stress—length changes in a sample between scribed lines after portions of the metal had been removed—a season-cracked rod showed stresses equal to 20,000 lb. residing in the outer layers. Uncracked rods which had been stored for a long period,

* Abstract of a paper read before the British Institute of Metals, March 10, 1921.

when studied in the same manner showed no longitudinal stress.

Corroded surfaces of such cracks in bars and tubes studied at Woolwich were green or dull brown in color; when soaked in distilled water a distinct evidence of NH_3 was found by Nessler's solution. No nitrates, however, were found in testing by diphenylamine. It was concluded that smoke from the open fires of green sap wood used in winter to heat the storage shed contained sufficient ammonia to be responsible for this corrosion-cracking. Spun cups known to be highly stressed were held in the fumes from the combustion of green sap wood for a confirmatory test. They were cracked in ten days. Chemical test also showed the atmosphere in the bell jar to contain much ammonia. In fact, ammonia is always found in considerable percentages in rain water from town districts, and therefore should be regarded as a potential source of damage to stressed brasses.

FEATURES COMMON TO SEASON-CRACKING

From all these observations, the authors summarize the following as being common to all season-cracking which has come under their study:

1. The pieces all appeared to be under an initial

FIG. 4. SEASON-CRACKS IN 70:30 BRASS CORRODED ON THE SURFACE. $\times 100$

stress, not induced by outside load and therefore nearly always internal or residual. Such stresses may probably be induced by strain-hardening.

2. The pieces were all strain-hardened in a differential manner—that is to say, the hardness was greater in one part than in another part. Whether this is an independent cause of cracking or whether it merely sets up internal strain is not known.

3. Chemical action on the surface seems to be necessary. Very frequently defective articles have been corroded sufficiently for a visible tarnish or even a deeper corrosion. On the other hand, some apparently unbroken lacquered or paraffined coatings did not prevent season-cracking. It was later demonstrated that neither of these coatings is impervious to reagents, especially ammonia, which is often the cause of the trouble. Nickel plate seems to be quite impervious to ordinary corrosion agents.

4. Season-cracking seems to be exclusively an intercrystalline failure.

EFFECT OF CORROSIVE SUBSTANCES ON STRESSED BRASS

It had been found by the authors that spun cups made by a smoothly operating manufacturing process could be regarded as having closely similar internal forces.

A lot is usually made from a softened sheet from one ingot. It was found that they invariably cracked in from two to three minutes in a 0.1 per cent mercurous nitrate solution, if the cups were first pickled in a dilute solution of nitric acid (40 volumes per cent of 1.42 HNO_3), quickly and thoroughly washed, and immediately immersed in the HgNO_3 solution.¹

The first appearance of cracking may be noticed under the solution by the disappearance of the slight coating of mercury on the surface, showing yellow lines of brass. It may be possible that this amount of mercury dropped into the opening crack. The yellow line, however, is covered by a bright deposit of mercury after the crack has fully developed. Some free acid accelerates all mercury solutions. Some concentrations

FIG. 5. SEASON-CRACKS IN MOUTHPIECE OF KLAXON HORN

of mercuric chloride plus hydrochloric acid give a dull to black coating of mercury which veils any early cracks. They also act slower.

Whereas corrosion cracking was very easy to induce rapidly in the cups, none appeared after the cups had been annealed 30 min. at or above 370 deg C., whether the cups had been made from a fully annealed brass strip or from the same brass strip after it had been hard

FIG. 6. SEASON-CRACKS IN 60:40 BRASS, FOLLOWING AN INTERCRYSTALLINE PATH. $\times 100$

rolled to Brinell 135. Spun cups were held for one year at 100 deg. C. continuously, and others on alternate days at room temperature, yet they did not break. These same cups broke in a time only slightly longer than the originals after a mercury immersion. It seems therefore that moderate temperature is not in itself sufficient to induce season-cracking, nor are the internal stresses

¹ 1 g. $\text{HgNO}_3 \cdot \text{H}_2\text{O}$ crystals plus 1 c.c. 1.42 HNO_3 made up to 1,000 c.c. with distilled water. Solutions having ten times this concentration will cause a crack in a few seconds in a badly strained brass.

responsible for the phenomenon relieved to any extent at the temperature of boiling water.

Cups made from both soft and hard brass strips and soft (60 Brinell) 96:4 phosphor bronze all crack under various reagents after the light pickling described above. The nature of this induced cracking is very similar if not identical to season-cracking.

Of a number of substances tested, including strongly corroding reagents such as nitric acid, hydrochloric acid, nitrogen peroxide and sulphur trioxide in damp air, none produced cracks except ammonia, ammonium nitrate and mercury deposited from solutions of mercury salts, although the trials were prolonged to severe corrosion and pitting. Mercurous nitrate tests on corroded specimens free from cracks at the conclusion of prolonged exposure to other reagents demonstrated the continued presence of severe internal stresses. Unstressed cups and other specimens were included in the trials; results showed that season-cracking occurred only when the brass was in a state of internal stress.

The authors reach the conclusion that season-cracking is therefore not induced in stressed brass by the mechanical weakening of the surface because of the irregular removal of metal by corrosion, but is brought about by the specific action of certain chemical substances, of which ammonia, its compounds, and mercury are known examples. A number of highly-stressed spun cups have been kept in atmospheres of ordinary purity for four years, yet not one has cracked, a fact which suggests that season-cracking of stressed brass is never "spontaneous," but can only be induced by chemical action of the kind indicated.

A damp mixture of ammonia gas and air, or strong ammonia solutions induce cracks in stressed brass very rapidly; cracks are formed at an early stage in the corrosion in some cases no corrosion is apparent. The action of dry ammonia gas is much slower.

RELATION TO FIRE-CRACKING

In order to discover whether season-cracking had much in common with so-called fire-cracking, various

FIG. 7. FIRE-CRACKS IN 70:30 BRASS PRODUCED BY RAPID LOCAL HEATING OF A SPUN CUP. $\times 100$

methods of unequal heating were tried, such as dipping part of a cup in a salt bath at high temperatures, or placing a cup in a hot furnace. The only way in which cracks were produced was by impinging a blow pipe flame at one point of the cup. Fig. 7 shows the intercrystalline character of cracks produced in this way.

Strips of 70:30 brass and of pure copper of various

Brinell hardness from cold-rolling were pickled and immersed in the mercury solutions, then removed and stored in tight chests to prevent evaporation of the mercury. After a longer or shorter time the strips were pulled in a tensile machine. The soft specimens had strength and ductility greatly lowered and the fracture changed from fibrous to fine crystalline. As the hardness of the original strip increased, the strength after long contact with mercury seemed to be less affected and at Brinell 183 the strength and elongation (the latter of which is naturally low in such condition) are but slightly lowered, except in some cases after storage for three months. In other words, cold-worked strips were far less damaged than soft metal.

Strips stored over 0.880 ammonia in air suffered a progressive decrease in strength and ductility with the time of exposure in all hardnesses. After long exposure the material can be crumbled in the fingers.

MECHANISM OF CRACKING IN MERCURY

The nature of some of the breaks suggested that the mercury had merely a surface effect on unstressed test-pieces, so another series of test-pieces, treated in the same manner, were broken by loading them at different rates. The effect of rate of loading was very marked when testing annealed brass: the test-piece loaded in forty-five seconds giving a maximum stress of 20,000 lb. per sq.in., with 23 per cent elongation, while the test-piece loaded in twenty-five minutes broke at 10,600 lb. with 7 per cent elongation. It appeared that free mercury on the surface penetrated the cracks formed in the skin at relatively low stresses, and if sufficient time is allowed, the mercury penetrates through the brass by the gradual extension of cracks into which it flows.

In view of these results it was thought that impact tests on notched bars might throw some light on the depth to which the weakening effect of mercury and of ammonia penetrates in unstressed brass. In none of these tests was the energy absorbed by breakage affected to any marked extent by the mercury or ammonia treatment, the figures remaining approximately constant throughout each series. They confirm the view that in unstressed brass the embrittling effect of mercury or ammonia penetrates only to a comparatively shallow depth even after long exposure, but it will be seen that the depth to which the weakening effect can penetrate is decidedly greater with the latter.

If test-pieces treated in mercury were allowed to stand for seven days and then cleaned of mercury by holding them at 200 deg. C. for forty-eight hours, they had exactly the same tensile properties as the untreated bars.

In order to find the minimum stress which would induce fracture under mercury treatment, a pickled test-strip was given a certain load, then swabbed with the 1 per cent mercury solution for five minutes. The pieces had a hardness of 60 to 170 and thickness up to 0.1 in. No breaks occurred under a stress of 12,000 lb. per sq.in., prolonged fourteen days, which figure may be regarded as the minimum stress which induces accelerated cracking by mercury treatment.

ACCELERATED CRACKS ARE INTERCRYSTALLINE

Some test-pieces were strained and then annealed so as to be made up of a few very large crystals. Crystalline boundaries were then marked by etching or by pencil marks, and the pieces then exposed to mercury or ammonia. After testing in tension the fractures in all

cases were certainly intercrystalline. When fracture was induced by ammonia, the fractured surfaces were accompanied by a characteristic iridescent tarnish; the ammonia seems actually to penetrate the brass. On the other hand, if mercury were taken from the surface of the test-pieces, even after sixty days' exposure, the strength and elongation were reduced approximately 40 per cent, but the fracture was fibrous and entirely different from the intercrystalline nature of the other fractures. It was also absolutely free of mercury, suggesting strongly that the penetration of mercury took place during and not before loading. Furthermore, individual crystals from these broken test-pieces were cleaned of mercury on the surface and very delicate chemical tests showed no mercury (or at least less than 0.00002 g.) in the body of the crystals.

Studies on the amalgams formed by immersion of brasses in mercury showed that during early exposure to mercurous nitrate mercury is replaced in solution by copper and zinc in practically the same ratio as these two elements are contained in the brass. However, immersion in mercury for 320 days gives a preferential corrosion of zinc. It appears that zinc diffuses through the liquid mercury bath and oxidizes on the surface, being replaced by zinc from the alloy. This gives a pitting effect, but there is still no penetration of the mercury into the solid alloy. The disappearance of mercury from the surface of brass in time is due to evaporation of the mercury rather than penetration into the metal. On the other hand, actual separation of the crystals occurred in unstressed brass after sufficiently prolonged action by ammonia.

INFLUENCE OF COMPOSITION

Stressed zinc-copper alloys do not crack under the action of mercury or ammonia if the zinc content is below about 6 per cent; the higher the zinc content the more readily does cracking occur. The authors are convinced that the action of mercury and ammonia is a trustworthy index of the liability of season-cracking, and therefore they would not expect season-cracking in copper or in its alloys with small percentages of zinc. The results of extensive trials with 70:30 brass containing small amounts of manganese indicate that these alloys when stressed crack quite readily or more readily than pure 70:30 brass when submitted to the action of mercury or ammonia. Cracks have also resulted after atmospheric corrosion. Therefore, no indication was found that the presence of manganese reduces the liability to the formation of season-cracks.

Stressed phosphor-bronze is cracked by mercury or ammonia, though much less readily than brass, and may possibly be subject to season-cracking if the conditions are sufficiently severe, but no example of season-cracking of phosphor-bronze in service has come under notice.

SUMMARY OF FACTS

Corrosion of the surface and sometimes of the walls of the cracks is frequently associated with season-cracking, but corrosion effects are not always visible.

Season-cracking may occur in brass coated with continuous protective layers, such as lacquer.

Nickelplating is probably completely effective in preventing season-cracking, if a sufficient and continuous coat of nickel is secured.

Highly stressed articles, capable of developing season-cracks in certain conditions, may be kept for years in reasonably pure atmospheres without showing any sign

of cracking, and there appears to be no reason to expect the development of cracks so long as the condition of the surrounding atmosphere does not change.

Some agency in addition to the presence of initial stress appears to be necessary for the development of season-cracks.

Corrosion does not necessarily favor the development of season-cracks in stressed brass. Very severe corrosion and pitting caused by the prolonged action of various acids and other corrosive agencies had no cracking effect on stressed brass liable to develop season-cracks in other circumstances.

Ammonia has been detected in a water extract of slightly corroded fractures caused by season-cracking in brass etched by atmospheric action only. Reason was found to suspect the presence of small amounts of ammonia in the atmosphere in which the specimens were stored.

It is probable that traces of ammonia in the atmosphere are an important agency, and possibly the main agency, inducing season-cracking of stressed brass.

Ammonia appears to have a specific and selective action upon the intercrystalline material of brass, weakening it sufficiently to cause cracking if in tension. Mercury has a similar but more rapid action.

The cracks produced in stressed brass by mercury or by ammonia are of the same intercrystalline type as season-cracks.

Season-cracks and the similar cracks caused by mercury or ammonia always begin in surface layers which are in tension.

PREVENTION

The important practical question of the prevention of season-cracking by the removal of initial stress has been previously dealt with by the authors.² A suitably controlled low-temperature annealing which will remove stress sufficiently to insure freedom from season-cracking with little or no effect on the hardness appears to be the most effective safeguard against failure by season-cracking and might well be applied to all brass articles made by cold-work operations capable of inducing permanent internal stress.

The wide divergences in composition, structure and physical condition of brass articles which have failed by season-cracking, together with the ease with which stressed brasses of very different compositions or of the same composition but differing in structure may be made to develop "season-cracks" by ammonia treatment suggest that within the limits of, say, 25 to 45 per cent zinc little improvement in resistance to season-cracking is likely to be obtained by changes in composition or treatment if the state of initial stress is not affected. The apparent advantages of harder-worked brass in resisting season-cracking is largely discounted by the higher stresses which are likely to exist in harder brass if steps are not taken to remove them.

Cold-work operations do not necessarily leave high internal stresses in the worked article. Many objects in which the hardness has been greatly increased by cold-work are not internally stressed. Operations may to some extent be controlled to avoid the development of internal stress even when the maximum hardness is necessary, but as a rule it is simpler and safer to remove internal stress by a final low-temperature

²H. Moore and S. Beckinsale, "Removal of Internal Stress in 70:30 Brass by Low Temperature Annealing," *J. Inst. Metals*, 1920 I, vol. 23, p. 225.

annealing than to avoid its development in the cold-working operations. Spinning appears always to produce some degree of internal stress.

It is obvious that stresses present in brass cannot exceed the yield point (regard being paid to the raising of the yield point which may have been brought about by local or general overstrain), and for this reason it is probable that in practice soft brass is unlikely to fail by season-cracking, since the stresses which can exist in it are low. Season-cracking has, however, been frequently observed in brass only slightly hardened by cold-work, but no example has yet come to notice in fully annealed brass.

The distribution of hardness has no necessary influence on internal stress, and cold-work operations which develop a high degree of hardness in one part of an object and leave other parts soft do not necessarily result in severe internal stresses, although they may sometimes induce them. In general it may be stated that internal stress is largely independent of hardness or distribution of hardness, with the reservations that when internal stress arises it is usually developed by operations which at the same time increase the hardness, and that the harder the material the higher is the maximum stress it is capable of sustaining without yielding.

RELATION TO AMORPHOUS THEORY

It is considered by the authors that this study of season-cracking and of the action of mercury and ammonia on stressed brass affords strong support to the hypothesis of an intercrystalline material differing essentially in its properties from the crystals themselves. For example, in the case of a pure alpha brass the intercrystalline material appears to be attacked by ammonia or by mercury much more rapidly than the crystals. The mercury probably alloys with the intercrystalline material, forming a mechanically weak alloy, while ammonia forms a chemical compound possibly of the nature of a cupramine. The apparent presence of an external layer on spun cups and on other cold-worked articles which retards the intercrystalline weakening action of both mercury and ammonia is an interesting confirmation of the view that the intercrystalline material is similar in its properties to the amorphous film produced by surface flow. The operation of spinning would be expected to produce a very definite surface film of Beilby's amorphous phase, and possibly, in addition, a thin lower layer of very severely deformed material containing a high proportion of amorphous phase. If the amorphous material is more capable of combining with or absorbing ammonia or mercury than the crystalline material, it might be expected to exercise some protective action, since the mercury or ammonia would be unable to act on the boundaries of the crystals below until the surface layer had become "saturated." The more rapid apparent disappearance of a thin mercury coating from the outer surface of a spun cup, in comparison with a similar cup from which the flowed surface layer had been removed by pickling before mercury treatment, would confirm this suggestion. The "disappearance" of the mercury coating was probably due in part to absorption of free mercury by the amorphous material in the surface layer. This applies to very thin coatings only; thicker deposits do not disappear except by volatilization, and there is little or no diffusion of mercury to an appreciable depth in brass.

The greater resistance of hard-worked brass to the

intercrystalline weakening action of mercury or ammonia may be explained by the much larger proportion of amorphous phase, much of which is assumed to exist within the deformed crystals. The capacity of hard-worked material for absorbing mercury or combining with ammonia should be much greater if the view be adopted that the amorphous material plays the chief part in such reactions. Since the amorphous phase is much more uniformly distributed in cold-worked brass, the selective weakening action is less concentrated at the intercrystalline surfaces. The more severe the cold-work the less should be the selective action at the crystal boundaries, and this is borne out by the diminished intercrystalline weakening as the hardness increases.

It does not appear to be necessary to ascribe peculiar mechanical properties to the intercrystalline substance in order to explain the phenomena of season-cracking, and the authors are unable to find in the results of their work any evidence indicating that season-cracking is the result of viscous flow of the intercrystalline cement. The undoubtedly intercrystalline character of season-cracks in brass appears to be fully explained by the selective weakening action of a chemical substance on the intercrystalline material. In this particular the authors' view of season-cracking in brass differs from that of Rosenhain and Archbutt,³ although there is agreement in so far as their explanation is also based on the assumption of an intercrystalline material probably identical in its properties with Beilby's amorphous phase found in surface films.

Calcium Silicide as a Deoxidizer

As a deoxidizing agent, calcium silicide, a compound now being manufactured in large quantities in France, is said by the *Ironmonger* to be rapidly gaining in popularity, especially in connection with electric-furnace steelmaking. Calcium silicide, which is a hard, bright, metallic body somewhat similar to ferrosilicon, dissociates when added to the molten metal, and the elements combine with the oxygen present in the bath of metal, and then recombine as calcium silicate, which, as in the ordinary reactions of slag formation, rises to the top. The reaction is a very vigorous one, and the energy liberated in the form of heat when the silicide decomposes is sufficient to bring up appreciably the temperature of the bath of metal. Thus the compound acts not only as a deoxidizing agent, but also as a means of bringing up cold heats to a proper pouring temperature. Another function attributed to calcium silicide is that of a desulphurizer. Under the conditions of the electric-furnace process an appreciable reduction in the sulphur content is said to take place. Its most marked advantage, however, is that it deoxidizes without leaving any harmful inclusions in the metal, and thus insures greater soundness. Calcium silicide, which, though hard, can be readily reduced to powder, gives the best results when added to the molten metal in small quantities, and in this connection the method of inclosing small amounts of the deoxidizer in paper bags and completely burying each one in the ladle of metal is found to be most convenient. For purposes where the carbon does not exceed 0.30 per cent carbon, the best results are said to be obtained by the addition of 10 to 20 oz. of calcium silicide to the ton of metal, while for metal containing more carbon about 30 oz. of silicide to the ton is necessary.

³"Inter-crystalline Fracture of Metals Under Prolonged Stress," *Proc. Roy. Soc.*, 1919, No. A674, p. 15.

Soldering Fluxes

BY A. A. LADON

THERE probably is no operation more commonly used than that of soldering. Almost every manufacturer, shop, garage, power plant, etc., finds everyday use for this process, yet the literature shows an almost absolute lack of information on the subject. As far as the writer's search revealed, there is no published technical or even semi-technical information. The explanation of this may be that the operation is considered too commonplace to deserve study. But this is not the case; a careful and complete investigation would unquestionably yield valuable results.

There are two forms of soldering—hard and soft. Hard-soldering refers to operations requiring a comparatively high temperature, such as brazing and silver-soldering. Passing mention only will be made of hard-soldering, for the purpose of this article is a consideration of soft-soldering. In brazing, the commonly used flux is borax, from which the water of crystallization has previously been driven. A slight amount of ammonium chloride is often added to the powdered dry borax. A widely used brand has the welding materials already mixed, which consists of powdered brass and borax. The brass used has a high percentage of zinc, so that when it melts on the weld the zinc partly volatilizes, leaving a brass of such composition as to give maximum strength.

Soft-soldering is by far the more commonly used. The most satisfactory solder for general purposes contains equal parts of lead and tin and is known to the trade as "half and half." The temperature used is that merely high enough to heat the parts to be soldered to the flowing point of the solder.

These considerations are fundamental and are given merely to bring to one's mind the operations which make necessary the use of soldering solutions.

SOFT-SOLDERING FLUXES

There are many types of soft-soldering fluxes on the market. The old and still commonly used flux is "cut" muriatic acid. Zinc is added to the acid until action ceases. Then the acid is ready for use. The active material is the zinc chloride formed. However, the action of the acid on the zinc is never complete, there always remaining free acid. This naturally makes corrosion bad unless all of the fluid is carefully washed off of the completed work. To lessen corrosion, commercial zinc chloride salt is often used, and while it is less corrosive than acid, still it excites corrosion markedly.

There are many commercial materials on the market known as soldering salts, the active material of them all being zinc chloride. For use, the salt is commonly dissolved in water. Alcohol is a better solvent, for it evaporates more quickly, and does not "spatter" so much.

The corrosiveness of zinc chloride made marketable the various "non-corrosive" fluxes on the market. Unfortunately all of the so-called non-corrosive materials are corrosive in a degree and unless carefully washed away excite corrosion.

The non-corrosive—so called—fluxes are made by mixing zinc chloride in a material not an electrolyte—such as vaseline. They can be mixed by stirring or running them through a common "buhr-stone." A very small amount of water added to the mixture and thor-

oughly incorporated with it has the effect of stiffening it. However, this is better accomplished by the addition of paraffine or the use of a higher melting-point vaseline. Ammonium chloride is often added.

Another useful form of soldering flux is in stick form. The chloride is "dissolved" in the paraffine and melted into shape.

From these statements, one might conclude that zinc chloride is the only active soldering flux. It probably does the quickest work, but there are many others, each with their advantages.

Phosphoric acid, lactic acid, tallow, rosin, glycerine, depending on the metals to be soldered, are good. Rosin is the only flux the writer has been able to find that is really non-corrosive. For ordinary work, it is used dissolved in alcohol. It is slow in action, and the solder does not flow well over the work. Tallow is corrosive on certain metals. Glycerine with slight addition of zinc chloride is very good on german silver.

There are probably a very large number of materials that could be used for fluxes, but zinc chloride—as corrosive as it is—seems to "hold the field."

DIFFERENT FLUXES FOR DIFFERENT METALS

Each metal requires a different flux to obtain the best results. On flat work a different flux should be used than that used on concave or convex surfaces. Each soldering problem has a particular flux that works the best.

The fact that the same flux does not work to advantage on all types of surfaces of even the same metal leads the writer to believe that the present conception of the function of a flux is not wholly correct.

To solder, the surfaces must be clean. Clean surfaces rapidly oxidize and present a very thin coat of oxide. The present theory is that the flux dissolves the oxide film so that the molten solder can alloy itself to the metal, but that is disproved by the fact that slowly oxidizing metals like copper or brass scratched and cleaned carefully in an atmosphere of nitrogen cannot be well soldered, even in that non-oxidizing atmosphere, without a flux.

A drop of molten solder placed on a clean metal remains in almost spherical form. The moment a flux is placed on that drop, the solder flattens out. This indicates that the action of a flux is to decrease the surface tension of the molten metal. This change of surface tension and the solution of the metallic oxides formed are the evident dual purpose of the flux.

There should be a means of decreasing the surface tension of molten metals other than by the use of a corrosive material, and it is the purpose of this article merely to present the possibilities of research on this subject.

Quinine Culture in the Philippines

The feasibility of an extensive culture of quinine in the Philippines is emphasized by Dr. Elmer Merrill, director of the Philippine Bureau of Science, in answering to an inquiry from Ely Lilly & Co. of Indianapolis, manufacturing pharmacist. Dr. Merrill points to the available big areas in Luzon and Mindanao Islands that are highly adapted for quinine culture. At present there is one small quinine plantation in Baguio. This plantation is under the supervision of the Bureau of Forestry and the results obtained from its operation indicate the success of the industry. Climatic conditions in the Islands are believed to be favorable.

Book Reviews

SILVER, ITS INTIMATE ASSOCIATION WITH THE DAILY LIFE OF MAN. By *Benjamin White*; 144 pp., one chart, illustrated. London: Sir Isaac Pitman & Sons, Ltd. Price \$1.

Silver is discussed as a commodity. In the first part of the book the author reviews its mineralogy, mining, metallurgy and marketing, and describes some of the early and modern mine fields. In the second part he discusses the silversmith's art at different periods, and enumerates many of the articles and ornaments into which the metal is manufactured. This portion of the work contains an interesting account of Indian industries, and a review of the evolution of British coinage. The third and last part of the volume is devoted to a discussion of the utility of silver as money, past and present, with dissertations on Indian currency and Chinese monetary problems, and the author's views of the present position and the future prospects of silver as money. The text is illuminated by numerous halftone illustrations, and is amplified with appropriate statistical tables and charts, the one showing the price fluctuations in London since 1832 being of special interest to students of the silver market.

The reader, if a student or engineer, is apt to gain a rather unfavorable impression of the book in the earlier pages, because they cover in an incomplete manner much ground with which he is already familiar. However, as he proceeds faithfully into the second and third parts of the book, his impatience is replaced by interest in the light of the discussions of monetary problems, if these subjects entertain him. To the non-technical reader, or layman, the work is likely to be quite interesting, and its perusal will leave him with entertaining impressions and additional information.

H. J. WOLF.

* * *

OFFICIAL AND TENTATIVE METHODS OF ANALYSIS OF THE ASSOCIATION OF OFFICIAL AGRICULTURAL CHEMISTS. Compiled by the *Committee on Revision of Methods* (R. E. Doolittle, Chairman, B. L. Hartwell, G. W. Hoover, A. J. Patten, A. F. Leeker and W. A. Withers). Revised to Nov. 1, 1919. Published by the Association of Official Agricultural Chemists, Washington, D. C., September, 1920, xii + 417 pp. 18 fig. Price, \$5.

The present volume is the latest revision of the famous "Methods of Analysis of the A. O. A. C." which were originally published as Bulletins 46, 65 and 107 of the Bureau of Chemistry, U. S. Department of Agriculture, and more recently (1916) as a supplementary part of the *Journal of the Association of Official Agricultural Chemists*. All of the earlier editions have been out of print for some time, so the present volume appears at a very opportune moment.

The methods of analysis are given for Fertilizers, Inorganic Plant Constituents, Waters, Tanning Materials, Leathers, Insecticides and Fungicides, Foods and Feeding Stuffs, Saccharine Products, Food Preservatives, Coloring Matters in Foods, Metals in Foods, Fruits and Fruit Products, Canned Vegetables, Cereal Foods, Wines, Distilled Liquors, Beers, Vinegars, Flavoring Extracts, Meat and Meat Products, Dairy Products, Fats and Oils, Spices and Other Condiments, Cacao Products, Coffees, Teas, Baking Powders and Baking Chemicals, Drugs, Soils, followed by seventy-eight pages of reference tables. The book closes with a good index.

The reviewer is in hearty accord with the statement in the preface: "It may be stated without reservation that more elaborate and painstaking effort has been expended on this collection of analytical methods than upon any other set of similar methods in the field of chemical science." Extreme conservatism is practiced in the adoption of a method as "official." This is well illustrated by the fact that the determination of amino nitrogen by Van Slyke's method is still (p. 216) a "tentative" method in spite of the fact that the ease of manipulation and the accuracy of the method

have been established beyond question. On the other hand, this same conservatism causes the retention of statements in "official" methods which are questionable. For example, on page 72, "amido nitrogen" undoubtedly refers to "non-protein" nitrogen and not to the CO-NH₂ grouping alone; likewise "amino" nitrogen in paragraph 12, page 168, does not refer to nitrogen in amino groupings, but to "non-protein" nitrogen.

It is an easy matter for a reviewer to find minor faults in a book. The virtues of the present volume are, however, sufficient to entirely overshadow any faults. The methods are "official" for all agricultural products, especially for all regulatory work where the possibility of judicial proceeding is always present. In court cases these methods are accepted as standard and binding. It is only natural, therefore, that the procedures outlined in these methods should be followed in the "food analysis" courses of our agricultural colleges and universities. The book is well printed on good paper and durably bound in tan buckram. It is such a necessary companion to the food and agricultural chemist that it is to be hoped arrangements have been made so that it will not again be out of print for any considerable period of time.

R. A. GORTNER.

* * *

THE OPEN HEARTH—ITS RELATION TO THE STEEL INDUSTRY—ITS DESIGN AND OPERATION. By *Victor Windett*. Pp. 378; 8½ x 11 in. New York: United Publishers Corporation. First Edition, 1920. Price \$7.50.

This book was originally issued by the Wellman-Seaver-Morgan Co. of Cleveland, Ohio, with no author's name given on the title page. A brief introduction led to the assumption that it is the work of engineers associated with the Wellman-Seaver-Morgan Co., since it states that "the facts given are based largely on their working data . . . constantly enriched by intimate exchange of experiences and records with the best practicing steel makers of the present time." Shortly after publication, however, the title page was changed, showing Victor Windett, one of the company's engineers, as author, and United Publishers Corporation as publisher.

In view of the great influence which one of the founders of the company—the late Samuel T. Wellman—had upon the early introduction and adaptation of the open hearth to the American steel industry, and the excellent labor-saving machinery which has been perfected and marketed by the company, notably the charging machine and ingot manipulator, the Hewlit unloader and the car dumper, one opens this rather imposing book with a feeling that it will undoubtedly contain much information of value to those engineers who have felt that the open-hearth furnace has not progressed as it should in recent years. Operators have apparently been so busy modifying the lines of their furnace to suit changes in fuel, refractories and charges that they have not given the attention to fundamentals which underlie rational improvements in construction. Designing engineers have seemingly been content to construct furnace accessories to fit a building rather than *vice versa*, as long as checkerwork flues, and valves not too far different in size from those in neighboring plants could be tucked into the cellar and kept above ground water. Little material on the essentials of furnace design is available in literature, but surely the Wellman-Seaver-Morgan engineers have it; and a book from them should become a furnace constructors' Bible.

Examination of the book proved a disappointment. Little or no detailed information on the fundamentals of furnace design is included. Even the generalities—often elementary—are confined almost exclusively to furnaces built to that company's design. Other widely known and excellent modifications are dismissed with a short paragraph.

It collects together a very large number of excellent photographs and line drawings, the latter printed in such a manner as to simulate blue-prints. While these drawings are mostly general drawings, many of them contain details which can be put to much use by the expert furnace draftsman content to follow the rule of thumb. A great amount of data has also been brought together on

acceptable operating details, as well as conventional furnace sizes. The book is particularly remiss, however, in discussing why such conditions exist, or what might be expected if these furnace lines were altered, either by design or accident.

On page 97 may be read the following words: "The proper planning of the gas and air ports is an important part of a furnace design. This insures a combustion so controlled as to throw into the bath a maximum of heat by radiation and combustion." How are these important objects to be attained? On page 123 are found sixteen lines on this subject. After noting the scouring action of hot, dusty gases, the book states: "Good practice requires the delivery of the air toward the top of the furnace. This insulates the roof from the intense heat of combustion and prevents excessive oxidation of the metal of the charge, for the oxygen-absorbing flame interposes. The slope of the ports should be such as to secure an intimate mixing of the air and gas at a height of about 3 ft. above the bath." On page 97 the following statement is also made: "Admission of fuel should be directed to obtain complete combustion without the flame impinging upon the roof, bath or ports at the opposite ends." That is about all. The slope and dimensions of the ports may be scaled from some of the blueprints. But is it not possible to figure the path of a certain current of burning gas in a furnace at various temperatures, so that before the furnace is built it would be possible to state whether the flame actually could be forced down so as to "lick" the bottom, as is necessary to "burn it in," and so the flame could lick the bath to provide the maximum heat transfer between flame and molten material? Some of the most astute furnace-men in the country now realize that velocity of air and gas, proper atomizing of fuel or its early and intimate mixture with the air for combustion are major factors in approaching the ideal heating conditions: the earliest possible combustion in the shortest possible time. One might fairly expect a discussion of such tendencies in a book of this kind.

Again, regarding the design of regenerators. The book states on page 124 that in many cases an allowance of anywhere from 65 to 140 cu.ft. of regenerators per ton of rated furnace capacity is needed. With this tremendous difference in practice, one would expect that scientific design would help to obtain an approximate idea as to which extreme was more nearly correct.

The author has the following general statement to make:

1. "As many checker bricks should be put into the chambers as possible to allow storing a maximum amount of heat from the waste gases without an undue increase in gas velocity." What, for instance, is an "undue increase in gas velocity"?

2. "A maximum of surface should be exposed." Could not several arrangements of brick be illustrated showing the amount of surface exposed as varied by the method of packing? Should checker brick be bought which have the best chance for subsequent cleaning and re-use, or brick which have the best ratio of surface to mass?

3. "The disposition of the checkers should be such as to have an intimate contact with the gases and air." Does this mean that there is to be a maximum of interference so as to produce the most eddy currents?

4. "The design must have a uniform volumetric capacity for the flow of air and gases through the various openings in the checkers." Elaboration of this sentence would doubtless clarify its exact meaning.

5. "The material used and the size and structure of the checker bricks must be adequate to carry the superimposed load on them at high temperature." How high, for instance, would a checker brick have to be before it would squat of its own weight when heated uniformly to 1,000 deg. C.?

6. "Means for securing increased velocity of flow at salient points so as to avoid flue dust deposits. This dust glazes over the brick surface and destroys their thermal qualities, in addition to cutting down the cross-section of the passages." The reviewer is of the opinion that most of the "dodges" for securing or controlling the flow of hot gases through a checkerwork are of very indifferent value. If vertical, well-insulated stove-like checkers would be built, instead of the long low ones now common, so that the hot

gases could travel from top to bottom and the air to be heated from bottom to top, a checkerwork not grossly misbuilt tends to balance itself; that is to say, the hot gases seek out the passages, where they can give up their heat at the maximum rate, and on the other hand the cold gases favor locations where they can absorb heat at the maximum rate. In other words, if they are given a chance by correct design, the hot gases reach the cold spots, and the cold gases reach the hot spots. Could any better automatic device be imagined?

E. E. THUM.

* * *

INTRODUCTION TO GENERAL CHEMISTRY. Text Book, by Herbert N. McCoy and Ethel M. Terry. 128 illustrative figures, 629 pages subdivided into 33 chapters. New York: McGraw-Hill Book Co., 1920. Price, \$3.50.

The authors state in the preface, "The choice and arrangement of topics in the earlier part of the book depart noticeably from the familiar order."

The reviewer believes that the reader of this review will best understand the comment when he has a clear idea of the general arrangement of the subject matter. It is for this reason that the "Table of Contents" is given: Chapter I, Introduction—Laws of Gases; II, The Burning of Substances—Oxygen; III, Pure Substances—Elements; IV, The Law of Definite Composition; V, Symbols and Chemical Formulas; VI, Chemical Equations; VII, Acids, Bases, and Salts—I; VII, Water and Solutions; IX, Acids, Bases and Salts—II; X, The Kinetic Theory of Matter and the Molecular Hypothesis; XI, The Atomic Hypothesis and Atomic Weights; XIII, The Halogens and Their Compounds with Hydrogen and Metals; XIII, Chemical Equilibrium; XIV, Hydrogen and Oxygen; XV, Oxidation and Reduction; XVI, Heat and Energy; XVII, The Ionic Hypothesis; XVIII, Applications of the Ionic Hypothesis; XIX, Applications of the Ionic Hypothesis: Reactions Involving Changes of State; XX, Electrochemistry; XXI, Nitrogen and Ammonia; XXII, Nitric Acid and the Oxides of Nitrogen; XXIII, Phosphorus and Its Compounds; XXIV, Sulphur and Its Compounds; XXV, Carbon and Carbon Compounds, Organic Compounds—I; XXVI, Organic Compounds—II; XXVII, Theory of Dilute Solutions; XXVIII, Disperse Systems; XXIX, The Atmosphere and Related Topics; XXX, Some Additional Elements and Their Compounds; XXXI, Classification of the Elements. The Periodic System; XXXII, Radioactivity and the Nature of Matter; XXXIII, Metallurgy.

It is only necessary to glance at this "Table of Contents" to realize that the claim of the authors is well founded. A statement in the introduction further defines the authors' viewpoint—viz., "It is to be assumed that the student taking up chemistry has had at least a one-year high school course in physics." In reading the text, however, the reviewer did not feel that a beginner in chemistry using this text would be so much handicapped by lack of such a course. The authors exercise considerable care in defining any terms or units used, many of which should be understood by a student who had had his assumed course in physics—e.g., in Chapter I the gas laws are carefully developed.

When one reads the text carefully and notes that Chapter VI ends on page 56 and that the student has made an acquaintance with many chemical reactions, the rôle of substances—elements and compounds—in reactions, and the quantitative significance of the chemical formula without being told anything about atoms and molecules, it is quite evident that the first part of the book is a departure. When one looks for his familiar friends oxygen and hydrogen, and finds they are not introduced until Chapter XIV, page 176, he is again struck with the new order of things. This might suggest looking for other old friends, e.g., the metals and their salts. When they are found not only will the authors be given credit with originality for "order and arrangement" in the first part of the book but even more so in the latter part, for if one is conscientious enough in his search he will find them very briefly considered in Chapter XXX among "Additional Elements and Their Compounds" and in Chapters XXXI and XXXIII.

Some other striking departures may be noted. Acids,

bases and salts are considered without reference to the dissociation theory, which follows in a later chapter. Although the gas laws are considered in the first chapter, the kinetic molecular hypothesis is not introduced until Chapter X.

Disregarding our individual views with respect to the arrangement of topics, it must be admitted that the authors have presented the topics in a clear and teachable manner. Chapters IV, V, VI, XIII, XVI, XVIII, XX and XXXII are especially well written. Chapters XXVII and XXVIII give special consideration to important elementary topics hardly mentioned in the ordinary introduction texts in chemistry. The book closes with a very well-arranged chapter on metallurgy.

When one follows the arrangement of topics and considers the method of treatment, he cannot fail to recognize that the authors have a "philosophy of arrangement" and the courage to present it.

CLIFFORD D. CARPENTER.

Recent Chemical & Metallurgical Patents

British Patents

Complete specifications of any British patent may be obtained by remitting 25c. to the Superintendent British Patent Office, Southampton Buildings, Chancery Lane, London, England.

Effecting Chemical Reactions Under Pressure.—Liquids, solids or gases which react at high temperatures under pressure are introduced separately or together, into heated pipes wherein the reaction takes place. The figure shows one form of apparatus in which the reacting materials are respectively forced by pumps 1, 7 into the connected pipes 2, 6 which are provided with valves 12, 13 and are heated in the tank 4 and metal bath 8. The outlet of the product is controlled by the valve 11. (Br. Pat. 156,264; not yet accepted; H. SCHELLENBERG, Wadenswil, Switzerland. March 9, 1921.)

Synthetic Tanning Agents.—Synthetic tanning agents consisting of coupled aromatic compounds, coupled aromatic and aliphatic compounds or coupled organic compounds and vegetable tanning agents are converted into aluminum or chromium salts, which also are tanning agents, by treating the free acids or their salts, or mixtures thereof, with aluminum or chromium compounds, or mixtures thereof. According to examples: tar oil is sulphonated and condensed with formaldehyde, the free sulphuric acid is neutralized by potash, and the product is neutralized by aluminum hydroxide; tar phenols of boiling point 185-200 deg. C. are heated with sodium sulphite and formaldehyde solution, the product is acidified by sulphuric acid and the sulphur dioxide boiled off, and the product finally neutralized by chromium hydroxide; a mixture of naphthalene and phenol is sulphonated and condensed with formaldehyde, the product is diluted, neutralized with lime till only feebly acid, filtered and finely neutralized with basic chromic sulphate; creosote oil is sulphonated and condensed with formaldehyde, and the product mixed with chromium sulphate and caustic soda solution until only feebly acid; a mixture of naphthalene and phenol is sulphonated and condensed with formaldehyde, the product is further condensed with tannin and formaldehyde and finally neutralized by potash and aluminum hydroxide; a mixture of 2:6 naphthol sulphonic acid and glucose is condensed with formaldehyde and the product

neutralized by chromium hydroxide. The products may be used in tanning, alone or mixed with other tanning agents, by any of the usual processes. (Br. Pat. 156,254; not yet accepted; CHEMISCHE FABRIKEN & ASPHALTWERKE AKT. GES., Griesheim-on-Main. March 9, 1921.)

Tannic Extracts.—Tannin-containing materials (wood, bark or leather) has the tannin extracted by alkali solutions. From the filtered extract the tannin is precipitated as an insoluble metal tannate, which is then decomposed by an acid, such as sulphuric or oxalic. A reducing agent such as a sulphite may be added in the alkali extraction to prevent oxidation of the tannin, or the extraction may be performed in a non-oxidizing atmosphere. When treating sawdust or shavings, any alkali-cellulose formed is precipitated by neutralizing the alkaline extract by an acid, before precipitation of the metal tannate. Br. Pat. 156,653; not yet accepted; Mrs. A. RIALLAND, Reunes, France. March 16, 1921.)

Synthetic Resins.—Synthetic resins, homologous with coumarone and indene resins, are obtained by polymerizing with concentrated sulphuric acid the tar oil fractions from carbolic or creosote oils which boil between 190 and 240 deg. C. and are free from coumarone and indene. The starting material is first freed from naphthalene by freezing and then from acid tar oils by extraction with alkali. The products of polymerization are isolated by distillation of the non-polymerized oils; they are useful for the manufacture of varnishes. (Br. Pat. 156,668; not yet accepted; CHEMISCHE FABRIKEN WORMS AKT. GES., Frankfurt-on-Main. March 16, 1921.)

Phenol-Aldehyde Condensation Products.—An initial liquid phenol-formaldehyde condensation product is prepared by the reaction of phenols (phenols, cresols, naphthols) with anhydrous polymers of formaldehyde (para-formaldehyde, trioxymethylene) in the presence or absence of alkaline catalysts; this liquid product is converted into the final insoluble infusible product by addition of liquid organic acids (lactic, acetic formic, ricinoleic, sulphoricinoleic, etc.) or solid organic acids such as oxalic, tartaric, citric, gallic or tannic acid, dissolved in a liquid organic acid together with small amounts of a mineral acid (hydrochloric, oxyacids of sulphur or phosphorus, boric, etc.); the conversion takes place in the cold, or more rapidly on heating. The initial liquid product with the acids added can be used as a varnish, or for glueing together laminæ of wood, wood and fabric, etc. Fillers, such as pumice, sand, glass, emery, asbestos, insoluble mineral bodies, paper pulp, sawdust, cotton, etc., may be incorporated in the mass, or its properties varied by addition of gelatine, glue, naphthalene, rubber, etc. Vessels resisting chemical reagents can be made from the final product, or laminæ or plates thereof can be glued on surfaces by means of the initial product varnish. (Br. Pat. 156,675; not yet accepted; J. BRUHAT, Bois-Colombes, France, assigned to Lorival Mfg. Co. of London. March 16, 1921.)

Vulcanizing Rubber.—Furfuramide and other nitrogen derivatives of furfuryl are used as accelerators in vulcanizing rubber. Several furfuryl derivatives are mentioned in addition to furfuramide, in particular the condensation products of pyromucic aldehyde with ammonia or amines. (Br. Pat. 157,050; not yet accepted; SOC. R. ALLENET & CIE., Deux Sevres, France. March 23, 1921.)

Coating Metals With Aluminum.—In a method of coating iron, steel, copper and other metals with aluminum, the cleaned surface is first coated with linseed or other oil, heated to burn off the oil, and again coated with oil; powdered aluminum, with or without the addition of oil or flux, which may be beryllium nitrate, or of sand or other hard material, is then applied to the surface, and the article is heated to about 1,200 deg. F. After cooling, the oxide which has formed is removed, and the operations are repeated until a coating of the desired thickness is obtained. The surface is finally treated with oil and heated to burn off the oil. A thicker coating of aluminum may be obtained by sweating sheet aluminum on to an aluminum-coated surface obtained as described above. (Br. Pat. 158,010; THOMPSON, LTD., J. THOMPSON and H. E. PARTRIDGE, all of Wolverhampton April 6, 1921.)

Current Events

in the Chemical and Metallurgical Industries

House Committee Approves Appropriations Requested by Hoover

Quite contrary to the usual practice, the Committee on Appropriations of the House of Representatives acceded to the request of the Secretary of Commerce and allowed the full \$250,000 requested for export industries. This fund is to be used principally in an effort to assist the twelve chief export industries, to wit: Cotton and cotton goods, paper and paper products, leather and leather products, chemicals (including dyestuffs), heavy machinery and machine tools, electrical goods, automobiles and accessories, lumber and lumber products, jewelry and silver, metal products, vegetable oils and hardware.

In addition, the committee approved the full amounts which Secretary Hoover asked for the Bureau of Standards as follows: Testing structural materials, \$50,000; industrial research, including elimination of waste, \$100,000; standardization of equipment, \$100,000.

These items are included in the second deficiency appropriation bill, which was reported to the House of Representatives on May 18.

Text of Dye Control Title

The complete text of the dye and chemical control title of the emergency tariff bill, as agreed to in conference, is as follows:

TITLE V—DYES AND CHEMICALS

Sec. 501. (a) That on and after the day following the enactment of this act, for the period of three months, no sodium nitrite, no dyes or dyestuffs, including crudes and intermediates, no product or products derived directly or indirectly from coal tar (including crudes, intermediates, finished or partly finished products, and mixtures and compounds of such coal-tar products), and no synthetic organic drugs or synthetic organic chemicals, shall be admitted to entry or delivered from customs custody in the United States or in any of its possessions unless the Secretary determines that such article or a satisfactory substitute therefor is not obtainable in the United States or in any of its possessions in sufficient quantities and on reasonable terms as to quality, price and delivery, and that such article in the quantity to be admitted is required for consumption by an actual consumer in the United States or in any of its possessions within six months after receipt of the merchandise.

(b) Upon the day following the enactment of this act the War Trade Board Section of the Department of State shall cease to exist; all clerks and employees of such War Trade Board Section shall be transferred to and become clerks and employees of the Treasury Department and all books, documents, and other records relating to such dye and chemical import control of such War Trade Board Section shall become books, documents and records of the Treasury Department. All individual licenses issued by such War Trade Board Section prior to the enactment of this act shall remain in effect during the period of their validity, and the importations under such licenses shall be permitted. All unexpended funds and appropriations for the use and maintenance of such War Trade Board Section shall become funds and appropriations available to be expended by the Secretary in the exercise of the power and authority conferred upon him by this section.

Sec. 502. That this title may be cited as the "Dye and Chemical Control Act, 1921."

Would Investigate Dust Explosions

A bill introduced in the Senate provides appropriation of \$100,000 to conduct further investigations of dust explosions in industrial plants.

Movement of Chemicals Through Canal

An analysis of the commodities which passed through the Panama Canal during March shows the following, of chemical interest, moving from the Atlantic to the Pacific: Nitrate of ammonia, 1,817 tons; silver sand, 2,492 tons; sulphur, 12,350 tons; caustic soda, 81 tons; chemicals, not otherwise specified, 520 tons. The nitrate of ammonia and silver sand originated in Continental Europe and was consigned to the west coast of the United States. The sulphur originated on the Gulf coast and was consigned to Australia. The caustic soda originated in the British Isles and was consigned to the west coast of South America. The bulk of the tonnage of chemicals not otherwise specified originated on the east coast of the United States and was consigned to the Far East.

Among the commodities moved from the Pacific to the Atlantic were the following: Nitrate of soda, 141,026 tons; camphor oil, 717 tons; chemicals (not otherwise specified) 113 tons; indigo, 2 tons; iodine, 7 tons; arsenic ore, 17 tons; manganese ore, 1,000 tons. The nitrate was destined as follows: east coast of United States, 52,215 tons; British Isles, 22,245 tons; other Europe, 39,465 tons; Azores Islands, 15,524 tons; West Indies, 11,577 tons. The camphor oil originated in the Far East and was billed to the east coast of the United States. The same is true of the chemicals which were not otherwise specified. The indigo originated on the west coast of South America and was sent to Cristobal for orders. The iodine was shipped from the west coast of South America and was destined to Continental Europe. The arsenic ore came from the Far East and was billed to the east coast of the United States. The same is true of the manganese ore.

Inventor of Gasoline From Peat Is Arrested. Charged With Fraud

On application made to Judge Lewis J. Smith at Mineola, L. I., by William H. Doolittle of Woodmere, Louis Enricht, of Farmingdale, was arrested on May 24 and released on \$1,000 bail, which he furnished with a certified check. The plaintiff before bringing the action filed a bond with a surety company as evidence of good faith. This action followed a summons and complaint made out by Doolittle, who said that he paid Enricht \$1,000 for 100 shares of capital stock in the Enricht Peat Gasoline Corporation.

Through his counsel, Dudley A. Wilson, Doolittle avers that on Nov. 18, 1920, at Farmingdale Enricht represented to him that he had organized a corporation known as the Enricht Peat Gasoline Corporation, of which Enricht was president, and that "he then and thereupon falsely and fraudulently represented that he was the inventor of a process and apparatus capable of producing gasoline for ordinary commercial usage from peat such as is found in and around the village of Farmingdale and various other parts of Long Island."

Enricht came into prominence several years ago when he announced that he could produce gasoline for 2c. a gal. by the introduction of a green ingredient. He had leading manufacturers of cars calling at his place, including Henry Ford, but nothing came of the green gas proposition.

St. Louis Chemical Plant Damaged by Fire

A fire which caused damage estimated at about \$50,000 started from an explosion in the first-floor laboratory of the Missouri Chemical Works, Inc., 1501 South Second St., St. Louis, on May 18. The plant, which employs about forty men, has been idle for several weeks and only two men were in the building when the fire started.

Program of National Lime Association Convention

The annual convention of the National Lime Association will be held at the Hotel Commodore, New York, June 15, 16 and 17. The foyer of the convention room will be occupied by exhibits of the National Association and of the Eastern Bureau. Details of the technical program follow:

WEDNESDAY, JUNE 15

Lime Production Problems

10 a.m. Assembly and roll call of member companies. Representatives are invited to make comments on the status and outlook of the lime industry in their home sections.

10:30 a.m. Introductory remarks, President Charles Warner.

10:40 a.m. Some New Features in Limekiln Construction. Richard K. Meade, chemical and industrial engineer, Baltimore, Md.

11:15 a.m. Chemical Control the Key to Kiln Efficiency. W. D. Mount, mechanical and chemical engineer, Lynchburg, Va.

12 m. The Fine Art of Lime-Burning. George B. Wood, president and general manager, Rockland & Rockport Lime Corporation, Rockland, Me.

12:45 p.m. Complimentary buffet luncheon.

1:30 p.m. Luncheon address. Standardization—Government Research and Industrial Development. Dr. S. W. Stratton, director, U. S. Bureau of Standards.

2:15 p.m. Quarry Management With Special Reference to Machine Versus Hand Methods. Irving Warner, plant manager, Charles Warner Co., Wilmington, Del.

6:30 p.m. Banquet.

THURSDAY, JUNE 16

Extending the Use of Lime

9 a.m. Symposium on the Special Properties and Merits of Lump Lime. Speakers to be announced.

12:45 p.m. Complimentary luncheon.

1:30 p.m. Luncheon address. The Business Outlook. Francis H. Sisson, vice-president, Guaranty Trust Co., New York City.

2:30 p.m. Delivering the Goods: The Dealer's Viewpoint. Tom Wright, manager, Building Materials Corp., formerly secretary of New York Station Building, Supply Dealers Association, Rochester, N. Y.

3 p.m. The Dependence of Modern Industry on Research. Arthur D. Little, president, Arthur D. Little & Co., consulting industrial chemist, Cambridge, Mass.

3:45 p.m. Why Is a Soil Chemist? or, Getting Facts About Lime on the Soil. Dr. W. H. MacIntire, soil chemist, Agricultural Experiment Station, Knoxville, Tenn.

4:15 p.m. Lime and Lime: The Plasticimeter Demonstrated. Warren E. Emley, U. S. Bureau of Standards, Washington, D. C.

FRIDAY, JUNE 17

Technical Department Accomplishments and Plans

10 a.m. Construction, L. H. Hart, manager.

10:20 a.m. Chemistry, Dr. M. E. Holmes, manager.

10:40 a.m. Agriculture, J. A. Slipper, assistant manager.

11 a.m. District Bureau Work.

Annual Table of Constants Delayed by Printers' Strike

Owing to delays incident to the printers' strike it has been found necessary to advance the date at which subscriptions at the special reduced rates will be received for the forthcoming Vol. IV of the Annual Tables of Constants and Numerical Data of Physics, Chemistry and Technology. Details concerning this volume, subscription rates, etc., were published on page 853 of our issue of May 11.

Members of the American Physical Society and of the four constituent societies of the Division of Chemistry and Chemical Technology of the National Research Council are entitled to a special discount. Subscription blanks may be obtained by addressing the University of Chicago Press, Chicago, Ill.

Dr. Stieglitz Talks on Electron Theory of Oxidation and Reduction

In delivering one of the best talks that has been made before the Chicago Section of the American Chemical Society Dr. Julius Stieglitz gave an extremely interesting exposition on the electron theory of oxidation and reduction, accompanying his talk with numerous lecture table experiments, at Kent Chemical Laboratory, University of Chicago, on the evening of May 20. His remarks are abstracted in the following paragraphs.

Recent developments as to the structure of atoms have brought more light on the subject in question. In reviewing a series of facts that are perhaps familiar to a great many of the members, we may nevertheless enjoy it again as one would delight in viewing an impressive and familiar landscape. We may deal with the electron as an intra-atomic phenomenon rather than an inter-atomic. Long before the present theories were developed the relation of the electron to oxidation and reduction was almost as thoroughly understood as it is now. By numerous experiments we may illustrate chemical action at a distance. These modern discoveries in regard to the electron have simplified the theory of chemical reaction.

In 1897 J. J. Thomson, the noted British scientist, made a fundamental study of oxidation in its relation to the X-ray tube, finding that the atoms of all elements are made up of electrons and that those which are negative in character have a mass $\frac{1}{1800}$, that of a hydrogen atom. Rutherford later discovered that the positive particles have larger mass than the negative. Electrons on the periphery of the structure are the ones which we are concerned with in oxidation and reduction. Experiments of chemical action at a distance demonstrate that the particles or electrons actually pass through the wire, as evidenced by the electric current. It is readily predicted that in the future many electrical methods will replace others in the accomplishment of oxidation and reduction. Current cannot be passed through a solution without having oxidation and reduction of the solution.

In a quantitative discussion of the subject consider the copper:zinc couple. The tendency of copper to give up its ions may be expressed by 10^{-21} , while a much larger tendency on the part of zinc may be expressed by 10^{-17} .

Such tendency on the part of substances to give up ions may be compared with vapor pressure as measured by the wet and dry hydrometer. The difference in temperature in the latter case is the same as the difference in potential in the former. Experiments show that the tendency of copper to give up its ions is not dependent on the concentration of copper in solution but on the concentration of the cupric ion. Activity, then, for oxidation and reduction depends on the concentration of free ions.

To sum up, we find that oxidation consists in the loss of electrons by atoms and that reduction consists in the gain of electrons by atoms. Not only does such action produce current in the wire, but oxidation and reduction may be accomplished by passing ions through the wire to the solution to be treated.

Summer Meeting of New Jersey Clay Workers

The New Jersey Clay Workers Association and Eastern Section of the American Ceramic Society will hold its regular mid-year meeting at Trenton, N. J., with morning and afternoon sessions. It is expected to call the meeting at the Trenton Country Club, as in former years. Prof. George H. Brown, Rutgers College, secretary and treasurer of the organization, is arranging an interesting and instructive program for the day, covering a number of papers on pertinent subjects in the ceramic industry. A large attendance is expected.

Union Bag Plants Closed Down

Plants of the Union Bag & Paper Corporation have been closed down due to walkout of employees, involving about 2,000 men. The newsprint plant of St. Maurice Paper Co., its subsidiary at Three Rivers, Quebec, Canada, employing 600 men, has also been closed. Wage agreements expired May 11.

Mme. Curie's Visit an Inspiration

Public interest in science has been increased immeasurably by the visit of Mme. Curie. This is the opinion of Dr. R. B. Moore, chief chemist of the Bureau of Mines. It has been a special encouragement to research on the part of women. "The American woman," said Dr. Moore, "has been content heretofore to devote most of her study to literature, art and music. As a result of Mme. Curie's visit thousands of women will be encouraged to take up the serious study of science. The country will derive great benefit from directing the feminine mind into channels of research—a mind peculiarly adapted to that kind of endeavor. Mme. Curie's visit has accomplished more in that direction than would a thousand lectures by men of science."

Mrs. Vernon Kellogg, who was in charge of Mme. Curie's activities in Washington, believes that Mme. Curie's visit has brought home to American women the fact that there is a wider field in which they may serve humanity and add to the achievements of civilization. Heretofore, Mrs. Kellogg asserted, research work has been regarded as man's sphere. The visit of Mme. Curie, she believes, will stimulate the desire among women to do scientific work.

The program in Washington was carried through without change. The gathering at the White House when the President presented Mme. Curie with the gram of radium was a notable one. The same may be said for the reception held at the Smithsonian Institution. The assemblage at the Interior Department building, when Mme. Curie dedicated the new cryogenic laboratory of the Bureau of Mines, was limited practically to scientists. On this latter occasion Mme. Curie was presented with a representative specimen of the carnotite ore from which her gram of radium was extracted. She also was given a jar of ore taken from the first shipment of the Colorado ore made in 1898.

National Fertilizer Association to Meet at White Sulphur Springs

The twenty-eighth annual convention of the National Fertilizer Association, which will be held at the Greenbrier Hotel, White Sulphur Springs, W. Va., the week beginning June 20, will have a program of reconstruction and co-operation.

The importance of the coming convention cannot be over-emphasized. The industry has many problems confronting it, which for proper solution must be given serious and immediate consideration.

The program will include addresses and discussions that are of vital interest to the fertilizer manufacturer in view of present business conditions. These subjects will include: more accurate knowledge of costs; chemical and manufacturing problems; better and cheaper methods of sale and distribution; relations of the industry with county, state and federal educators; transportation and freight problems, etc.

The officers of the association are now arranging the details, and promise a meeting that will be of unusual interest and lasting benefit to everyone identified with the fertilizer industry.

The important meetings will be as follows:

Monday, June 20—Soil Improvement Committee (N.F.A.) Subscribers.

Tuesday, June 21—Southern Fertilizer Association.

Wednesday, June 22—National Fertilizer Association—First Session.

Thursday, June 23—National Fertilizer Association—Second Session.

Etching Reagents for Nickel and Nickel Alloys

An interesting development in connection with the etching of nickel and its alloys is the use of concentrated hydrochloric acid. This appears to be the best reagent for producing contrast without pitting of the surface that has yet been tried. It is rather hard to etch nickel and ordinarily the metal pits considerably and a plain etched pattern—that is, one in which there is no contrast between different grains—is the usual result. Etching in concentrated hydrochloric acid for a considerable period, say one hour or more, gives very satisfactory results.

Chicago Chemists Club Hikes Over Dunes

Hiking over the dune district of Indiana at the southern point of Lake Michigan has been a popular pastime with several Chicago scientific men for many years. Never before, however, has such a large party of chemists enjoyed the pleasures of the dune trails as did the official hikers of the Chicago Chemists Club on Sunday, May 15. Arranged by P. N. Leech and guided by the dune authority, Dr. A. J. Cramp, seconded by Mrs. Cramp, about seventy members trailed from Tamarack to Tremont, stopping at one of the large sand blowouts for lunch. The ladies took the short trail, the men the long trail.

From barren wastes to tropical vegetation, from cactus to tamarack, from orchids to pine trees and the cold wind of the lake to the oppressive heat of the swamps the party explored the wonders of the remarkable region. Like the marvels of the Grand Canyon of Arizona, the dunes of Indiana must be visited to be appreciated. The chemists of Chicago were thoroughly initiated to the aggregation of dune boosters. An impromptu baseball game while waiting for the train at Tremont closed a perfect day.

Goodyear Tire & Rubber Co. Reorganization

Edward G. Wilmer, formerly vice-president of the Steel & Tube Co. of America, is the new president of the Goodyear Tire & Rubber Co. His election to that office was announced following a meeting at which the reorganization of the company was completed. He succeeds F. A. Seiberling, whose resignation was part of the program of the new interests identified with the company.

The new board of directors was announced as follows: J. P. Cotton, of McAdoo, Cotton & Franklin; P. W. Litchfield, of Akron; Grayson M. P. Murphy, of New York City; J. R. Nutt, president of the Union Trust Co. of Cleveland; Robert C. Schaffner, of A. G. Becker & Co., Chicago; A. A. Schlesinger, president of the Steel & Tube Co. of America; G. M. Stadelman, of Akron; Ralph Van Vechten, vice-president of the Continental & Commercial Trust & Savings Bank, Chicago, and Mr. Wilmer.

Messrs. Stadelman and Litchfield are to continue with the company as vice-presidents. H. H. Sprinford is treasurer and Charles A. Stillman secretary.

Mr. Wilmer, who is a comparatively young man, will, it was stated, move from Milwaukee to Akron and devote all his time to the affairs of the company. Before becoming associated with the Steel & Tube Co. he was active in the mining industry, being identified with iron ore and coal mining projects.

General Asphalt Co. Annual Meeting

At the annual meeting of the General Asphalt Co., held in Camden, N. J., three directors whose terms expired, Henry W. Biddle, Charles E. Ingersoll and Sidney F. Tyler, were re-elected for terms of three years.

President Arthur W. Sewall told the stockholders that the manufacturing part of the company's business in January and February was only about 20 per cent as large as in the corresponding months of 1920 and in March and April about 33 per cent. So far in May, however, there are indications of some further recovery.

Since the fire at the Maurer, N. J., plant the manufacture of products such as roofings, floorings, etc., has been carried on at the Madison, Ill., plants. Operations at Maurer have been confined to oil refining and the preparation of asphalt. Officials expect to resume manufacturing at Maurer in June.

May Continue Dye Licensing

The statement was made on the floor of the Senate May 23 that the Committee on Ways and Means of the House will recommend that the licensing and embargo provisions contained in the emergency tariff bill be continued for a period of five years. Senator King, in a speech on the floor of the Senate, characterized such legislation as un-American and indefensible on any economic grounds. He declared that it would perpetuate a dye monopoly in the United States.

Corn Products Refining Co. Operating at Slightly Over 50 Per Cent

The Corn Products Refining Co. is now operating something over 50 per cent of capacity, grinding 75,000 to 80,000 bushels of corn a day. Its capacity is about 155,000 bushels a day. As in other lines of business, the company's volume has decreased because of the hand-to-mouth buying policy of the consumer, according to E. T. Bedford, chairman of the board. On the other hand, Mr. Bedford points out that the corn products manufactured by the company are staple food commodities, whose consumption is not subject to wide fluctuations. He expects some increase in business as the year progresses. Inventories are known to be low, and there are no large accumulated stocks which must be worked off.

The company's English plant finds it impossible to get coal, because of the coal strike. The two small German plants are running full and doing a good business. The French plants are now in course of construction. They should be running full by the late summer. Their capacity is 10,000 bushels of corn a day. Demand which these plants will later fill is being cared for by shipments from United States. The extent of foreign business will be governed entirely by the course of the foreign exchanges, any improvement being reflected in better export business.

An idea of the enormous volume of business transacted by the company may be gained from the fact that it sold 400,000,000 separate packages of products last year. The company is an enormous user of tinplate for containers.

Electrochemists to Meet at Lake Placid

The directors of the American Electrochemical Society have decided to hold the fall meeting at Lake Placid, N. Y., Sept. 29 and 30, and Oct. 1. Arrangements have been made to keep Lakeside Club house open for this occasion. Special effort is being made to provide an interesting technical program, including special symposia on non-ferrous electrometallurgy and on electrodeposition, the latter including electroplating, electrotyping and electrolytic refining. The organization of a division on electrodeposition is in prospect.

Members of the society are urged to consider the feasibility of combining a vacation outing with the convention, spending some time at Lake Placid either before or after the dates of the meeting. Full details as to transportation, accommodations, rates, etc., will be mailed to members of the society and published later in this magazine.

Coloring Gem Stones With Radium Emanation

Experiments which hold the promise of giving color to colorless gem stones through exposure to radium emanation are being carried on at the Rare and Precious Metals Station of the United States Bureau of Mines at Reno, Nev. In preliminary experiments, a colorless Colorado topaz was tinted yellow by exposure to penetrating radiation. The coloring, however, was found not to be permanent when exposed to light. Experimental work with a view to making the color light permanent is being continued.

If these later experiments should prove successful and it is found that radium possesses the power to color gem stones, the discovery would increase the commercial value of gem stone material found largely in the West, the market value of which has been lessened on account of the lack of tint deemed essential by gem fanciers.

Phosphate Export Association

The Phosphate Export Association, comprising four member concerns in New York City (International Agricultural Corporation, Coronet Phosphate Co., the Phosphate Mining Co. and Southern Phosphate Corporation) have combined, for the purpose of export trade, with the Florida Hard Rock Phosphate Export Association, comprising five member concerns in Florida and Georgia (J. Buttgenbach & Co. of Dunnellon, Fla.; C. & J. Camp of Ocala, Fla.; Gummer Lumber Co., of Jacksonville, Fla.; Dunnellon Phosphate Co., of Savannah, Ga.; and Mutual Mining Co., of Savannah). Papers have been filed with the Federal Trade Commission under the export trade act (Webb-Pomerene law). The

main office of the combination will be located in New York City, with branches in Savannah, Ga., and London, England.

Phosphate rock is used principally as a fertilizer, either directly, with no further treatment than grinding, or changed to acid phosphate by chemical treatment.

A market for Florida land pebble phosphate and Florida hard rock phosphate has already been established in the United Kingdom, Continental Europe and Japan.

Phosphate exports from the United States in 1920 amounted to 344,896 tons of hard rock, shipped from the ports of Fernandina and Jacksonville, Fla., and 693,355 tons of land pebble, shipped from Tampa, Port Tampa and Boca Grande, Fla.

New Tanning Material

Experiments conducted in recent months at the Laboratoire General des Productions Coloniales, Paris, France, show the value as a tanning material of a plant known as *Acacia arabica*. Investigations indicate that it can be used for tanning either alone or with sumac, quebracho and oak bark. It is said that there is a possibility of the material later replacing Sicilian sumac.

Personal

Dr. CARL L. ALSBERG, chief of the Bureau of Chemistry, Washington, D. C., was elected an honorary member of the American Oil Chemists' Society in session in Chicago May 17.

HAL T. BEANS and THOMAS B. FREAS, who were associate professors of chemistry at Columbia University, and MARIE REIMER, associate professor at Barnard College, have been given the rank of full professors. SAMUEL J. KIEHL, instructor in chemistry, and E. G. MILLER, Jr., associate in biological chemistry, have been made assistant professors. This announcement by the trustees of Columbia University follows closely upon the statement that the chemistry building is to be one of the two buildings erected on the Morning-side campus in the immediate future. It serves also to emphasize the statement recently made by Dr. Nicholas Murray Butler, president of the university, that "the central science just now and the one that is likely to remain the central science for some time to come, is that many-sided body of knowledge called chemistry."

H. M. COOPER has been placed in charge of all analytical coal work of the Bureau of Mines, Pittsburgh, Pa.

R. ADAMS DUTCHER, a graduate of South Dakota State College, has resigned his position in the agricultural biochemistry department of the University of Minnesota to accept the position of chief of the agricultural chemistry department of the Pennsylvania College of Agriculture.

Prof. TREAT B. JOHNSTON of Yale University delivered a special lecture on biochemistry before the Philadelphia Section of the American Chemical Society in Philadelphia on the morning of May 19.

N. D. LAMBERT, formerly assistant superintendent in the New York Mutual Gas Light Co., has joined the Lambert Meter Co. as its chief engineer, secretary and treasurer.

EDWIN E. SLOSSON of the National Research Council was in Chicago recently and delivered a lecture at the University of Chicago.

BRADLEY STOUGHTON, secretary of the American Institute of Mining and Metallurgical Engineers since 1913, has tendered his resignation to be accepted at the convenience of the board of directors.

At the May meeting of the Chicago Chapter of the American Society for Steel Treating, held Monday, May 16, 1921, the following officers were elected for the ensuing year: Chairman, H. F. Wood, metallurgist, Ingalls Shepard Division, Wyman Gordon Co., Harvey, Ill.; vice-chairman, P. A. Lovegren, Standard Forgings Co., Indiana Harbor, Ind.; secretary-treasurer, Harry Blumberg, metallographist, Illinois Steel Co., Chicago, Ill.

Current Market Reports

The Chemical and Allied Industrial Markets

NEW YORK, May 28, 1921.

New indications of improvement have been noted in the chemical market during the past week. Conditions, however, still remain quite unsettled, but it is apparent that the pendulum is once more swinging in the right direction and it looks as though a slow but steady improvement in the volume of business may be expected.

There were domestic inquiries for numerous quantities of solid *caustic soda* and these had a strengthening influence on prices in the late trading. Since caustic is considered the actual guide for all of the more important chemicals, it is certain that the rest of the list will follow along the same steady lines. Caustic soda has advanced from \$3.60 per 100 lb. to \$3.85. It is very doubtful if the inquiry could be filled at any lower figure. The textile, soap, oil and other large consuming industries came into the market in better buying spirit than at any other time since last November. Soapmakers around New York purchased tremendous quantities of tallow and oil. Along with caustic soda there has been a heavy demand for *soda ash*, with a decidedly strong market for spot material. Small lot inquiries for *bichromate of soda* kept prices steady at 8@8½c. per lb. *Nitrite of soda* was pushed to 8c. per lb. under better selling early in the week, but lost a little of its firmness and closed at 7½c. *Citric acid* recovered somewhat from its recent slump and displayed a slight spurt that may last during the hot weather. Resale *caustic potash* developed a little firmer tendency and reports were current that soapmakers had purchased several large quantities around the extremely low figures. *Bleaching powder* has moved quite freely to paper mills and bleacheries. The general price has been 2½c. per lb. f.o.b. works, although it is rumored that this figure has been shaded where round lot business was at hand. There was some buying noted on *oxalic acid* for laundry supply houses and textile mills have kept domestic material in a somewhat steady position. The imported variety was held at 16½c. per lb. and upward according to seller and quantity. *Copper sulphate* has shown improved buying from textile mills and agricultural interests, and business, although not up to the standards of the previous year, is gradually coming into proportion to a seasonable average. The general tone was quite steady.

EXPORT CONDITIONS

The export trade is coming along rather slowly. There are some makers who say they are getting better inquiries from South America and that the Orient is just trying the market out with small miscellaneous inquiries, but as far as actual placing of large business is concerned there is not very much to state and the outlook is very uncertain until ways and means are found to extend foreign credits. Most foreign buyers are demanding three to six months' time for payment and this is the fundamental drawback that is keeping American interests away from active competition for the export trade. Soda ash is still attracting most attention for import. June shipments of English ash are offered at \$1.90 N. Y. Oxalic acid is not far below domestic prices when the 1½c. per lb. duty is allowed. The inside German price is said to be 14c. per lb. at German producing points.

It may be stated generally that the tendency of trade is toward expansion. Manufacturers, dealers and jobbers have reduced their surplus stocks in most quarters and there is not as much pressure on prices now as was noted formerly from accumulations. The same condition is practically true in the consuming trade and these two factors combined seem to forecast an early revival of sound business. The placing of large foreign loans and the eventual establishment of foreign credits appear to be reasonably near. A revival in our export trade would add considerably to our domestic business.

Dealers offered spot *carbonate of potash*, 80-85 per cent, calcined, at 6c. per lb. and stated that sales are going through at this figure in a small way. The movement at present is rather quiet and it is possible that a slight concession might be made on a firm order. Resale spot *bichromate of soda*, standard make, is holding firm at the late advance and dealers report a fair inquiry for moderate quantities. Prices range from 8@8½c. per lb., according to quantity and seller. Limited resale offerings of solid *caustic soda* are keeping the spot market in a firm position and the best price heard at the closing was \$3.85 per 100 lb. Dealers quoted the market at \$3.85@\$3.90 per 100 lb., ex-store, and at 4c. per lb., f.a.s. steamer N. Y. The inquiry was rather active, although buyers are showing some hesitation in committing themselves owing to the advanced prices named. First hands quote the market for *chlorate of soda* firm at former prices and report a fair inquiry from the domestic consuming trade. Standard American goods are obtainable at 7½c. per lb. f.o.b. works, for prompt shipment. There were a number of sales of *nitrite of soda* on spot reported at 7½c. per lb. The feeling in this commodity continues firm, with sellers asking up to 8c. per lb. Several interests continue to predict higher prices and are not recognizing the present level with their offerings. Several sellers of imported *prussiate of soda* have advanced the market to 13c. per lb. ex-store N. Y. Other dealers state that 12½@12¾c. can still be done, although they admit that the holdings are becoming smaller and there is a tendency to tighten up offerings in most directions. Light *soda ash* for resale in single bags is held at \$2.15 per 100 lb. Less than carload lots in barrels are moving at \$2.50@\$2.60 per 100 lb. and it is said to be doubtful if much below the inside price could be done on carload lots on account of the limited extent of resale stocks. Small sales of lump *potash alum* are reported at 4c. per lb. Producers named the same price for *ammonia alum* with the usual advance for ground and powdered. The general movement is quiet with small lot sales attracting the most attention. Odd lots of resale *formaldehyde* were offered at 14c. per lb. f.o.b. works. The spot market for prime material appears quite steady at 14½@15c. per lb.

The market on *ethyl alcohol* is reported as easy, while the movement into consuming channels is of a light routine nature with prices quoted at \$4.75@\$4.95 per gal. Competition in *denatured alcohol* is still keen owing to easy supplies and light demand, and prices range from 31@42c. per gallon, depending on formula. Trading in *methanol* holds to light routine lines, with the 95 per cent quoted at 75@77c. per gal. and the 97 per cent at 78@82c. per gal. The market on *shellac* is holding firm and with the prospects of very little in the way of shipments expected the tendency of prices will be upward for a while. The T.N. is in good demand for bleaching purposes and limited supplies are keeping prices on the jump, with the market quoted at 70@72c. per lb.

COAL-TAR PRODUCTS

The tone of the coal-tar products market became more steady with the encouraging news that the emergency tariff bill, having to do with the dye measure to extend protection for three months against dumping, has been passed by both houses and is awaiting the signature of the President. There is a pronounced feeling of security among the leading producers and increased activity was noted throughout the list, whereas a few weeks ago curtailment was the rule. The crude market is steady and some products are becoming more active. *Benzene* is in good demand and supplies are none too plentiful, while prices remain firm at 27@30c. per gal. for the pure grade and 25@28c. for the 90 per cent. *Naphthalene* is easy, with the flakes quoted at 7½@8c. per lb. and the balls at 8½@9½c. *Phenol* is rather quiet, with supplies ranging from 10@14c. per lb.

The demand for intermediates is confined to limited quantities, but this demand seems to be slowly broadening out, reaching among some of the more inactive producers. *Aniline oil* is quiet and prices range from 20@25c. per lb., depending on seller and quantity. Sellers of *beta naphthol* are steady in their views and prices range from 34@45c.

per lb. There is little activity in *dimethylaniline* and prices are quoted at 41@50c. per lb. Consumers of *diphenylamine* show some interest here and there and prices range from 60@70c. per lb. *Paranitraniline* is reported steady at 85c.@\$1 per lb. Producers report a limited amount of routine business passing in *alpha-naphthalamine*, but little in the way of new demand is noted. Supplies are quoted on the basis of 35@40c. per lb., depending on quantity. The consuming demand for *benzidine* is quiet and moving in small lots. Supplies are reported in fair volume and while sellers' views are around \$1@1.05 per lb., shading is being done on firm business. The sulphate is quoted at 75@85c. per lb. The market for *cresol* reflects a more active demand and sellers are steady in their ideas on prices at 16@18c. per lb. The market is reported easy on supplies of *cresylic acid*, although of late a slightly better demand has been noted. Prices have shown practically no change from former levels with the 97-99 per cent quoted at 70@80c. per gal. and the 95-97 per cent at 65@70c. per gal. Producers are firmer in their views on *salicylic acid* and quote 26c. per lb. for the U.S.P. grade. The technical is steady at 22@24c. per lb. The production of *ortho-amidophenol* is confined to only a few factors. The demand is of a light routine nature, although a slight increase in the inquiry is noted. Prices are quoted at \$3@\$3.10 per lb., but a firm order will no doubt bring out lower prices.

WAXES

The market for *beeswax* was practically unchanged, with trading reported as routine only. Crude African held at 16@17c. per lb., with the Brazilian at 24@26c. per lb. Importations of beeswax for the nine months ended with March were officially placed at 1,826,864 lb., which compares with 2,247,286 lb. for the corresponding period one year ago. Traders of *carnauba wax* report a moderate buying interest in futures, but spot inquiries remained quite light. Prices were unsettled, especially on the higher grades. No. 2 North Country closed at 28@30c. per lb., with the No. 3 North Country at 16@17c. per lb. There were sellers of *Japan wax* on the spot market at prices ranging from 18@18½c. per lb., depending on quantity and seller. The market was barely steady in some quarters, while others stated that inquiries were being received in moderate volume. At any rate, trading was quiet and with futures available at concessions the situation seemed to favor buyers. The export inquiry on *paraffine wax* was quiet and with trading in a domestic way also inactive prices were irregular with some traders showing a willingness to shade prices. Exports of paraffine in March amounted to 14,173,706 lb., which compares with 45,753,998 lb. for March, 1920. Exports for the nine months ended with March amounted to 213,617,355 lb., contrasted with 256,905,209 lb. for the corresponding period one year ago. Scale wax, 122-124 deg. melting point, closed nominally at 2½@2¾c. per lb. Refined wax, 128-130 deg. melting point, settled around 5c. per lb.

The St. Louis Market

ST. LOUIS, May 27, 1921.

Business during the past two weeks has assumed a brighter aspect. While individual orders remain small, the demand for chemicals has improved and is one of wider scope. The general tone of the market is optimistic. Business in all groups has been considerably better than in the immediate past and sellers are encouraged over the outlook for the future.

ALKALIS

The market on *caustic soda* is dull with inquiry much below routine, but a little activity in price. *Soda ash* continues to enjoy routine demand, with business confined principally to jobbing lots at \$3 per 100 lb. in barrels, basis 58 per cent. Heavy stocks of *bicarbonate of soda* are being liquidated on basis of the new manufacturing schedule plus freight.

INDUSTRIAL CHEMICALS

Sulphur continued to remain very firm at 2½c. per lb., with usual good demand. There has been no change in *ammonia*

water, 26 deg., and sales during the past two weeks have shown a slight increase. *Sodium hyposulphite* is moving in the routine way. A heavy demand for *zinc stearate* has been evidenced in the past several weeks and with the approach of summer a large volume of business should be expected, hence suppliers should endeavor to keep maximum stocks. The *zinc* market is stiffening and *sulphate* is being quoted 3¼@3½c. lb. f.o.b. producers' works.

DRUGS AND PHARMACEUTICALS

Bismuth preparations continue to be very active. *Cream of tartar* is in fair demand. Very good business has been passing on *iodides*, with a firm market. The demand for *sodium benzoate* is increasing, and prospects for the future are encouraging in view of the preserving and canning season. There has been a decline of 2c. per lb. on *sodium bromide* and 5c. per lb. on *potassium bromide*, which probably has been forced by the low offerings of the foreign producers. *Hard mercurials* have declined recently. The prices of *zinc oxides* remain the same, but the demand for the 5 and 10 per cent leaded by the paint trade has increased sales on these particular grades, while the lead free continues to command a good demand. *Glycerine* was unable to hold its recent advance to 17c. and has dropped back to its low level of 16½c.

ACIDS

Citric acid has not shown the improvement which was expected; in fact, the demand has been very quiet, with no change in price; however, there are distressed lots being offered at considerably below the ruling market figure. *Tartaric acid* has been commanding good demand, with a firm market.

COAL-TAR PRODUCTS

The supply of *benzene* is rather limited, due to a curtailment in production, and the demand is fairly good.

VEGETABLE OILS

Linseed oil has continued its steady advance in the past two weeks and today holds firm at 77c., basis raw, from warehouse in cooperage. The usual differential for direct shipments in carlots prevails and some crushers are booking at the above price to Aug. 1. After a rise to 83c. maximum, *turpentine* slowly declined and today is holding at 69c. with fair demand. *Castor oil* has advanced and today holds at 10½c. in drums or 11c. in barrels.

The Iron and Steel Market

PITTSBURGH, May 27, 1921.

Production of steel has shown a distinct declining tendency in the past week. At no time this year has there been any material increase in the rate. While the present decline is not rapid, it is impressive for two reasons, because it is from an already low rate, say 30 per cent of capacity, and because it is shared alike by the Steel Corporation and the independents. During the first three months of the year the Steel Corporation's rate, which had been above 90 per cent, declined almost continuously and rather sharply, but the independents were operating at a shade better rate at the beginning of April than at the beginning of January. Now the corporation is operating at about 35 per cent or a trifle more and the independents at between 20 and 25 per cent.

All producers are filling orders and specifications, as received, as promptly as possible, and some remarkable records are made. There is scarcely any tonnage at all that is scheduled ahead, and often, indeed usually, when a mill or department starts a week at a certain percentage rate it is not known at what rate it will be working on Friday or Saturday. Thus the producers have no reserve and production promptly follows the rate at which orders and specifications are received.

Buyers are in a corresponding position. They do not order material ahead, but hold back their commitments until the last moment, usually making up an order or specification for a single carload, containing a wide variety of sections or descriptions of material. The matter that is often prom-

inent in a market not overly strong, price guarantee to date of shipment, does not arise, for there is scarcely any interval between the placing of the order and the actual shipment.

PRICES HOLD

The equalized prices developed about the middle of April are holding very well, sales at concessions being very rare in point of numbers, but that condition may be attributed to the character of the business being done rather than to the steel market having any inherent strength. Orders are so small that it is hardly worth while to seek a cut price, and there is usually not sufficient time. Again, the producer has no incentive to cut prices, since there is not enough business offered to give any promise that operations could be swelled by the price-cutting route. In occasional instances an order of exceptional size may go at a concession, but it should be remembered that in the past such concessions have been given in a market that was distinctly strong.

There is no expectation whatever on the part of either sellers or buyers that the present steel prices will hold through another buying movement, one of anything like ordinary proportions. It is generally accepted that the present market prices are simply for present conditions and that when any latent buying disposition develops the sellers will meet the buyers half way or more than half way. With a larger operation production costs would be materially reduced. They are very high now, even without inclusion of overhead.

WAGES

A large steel interest east of Pittsburgh has reduced its rate for common labor to 30c. an hour, while no overtime for hours in excess of eight in the day is allowed. Other mills have shown no disposition to adopt a 30c. rate, though it is a common opinion that by the time the present general readjustment in industrial and economic conditions is completed the common labor rate is likely to be about 30c. The steel industry considers the cost of living very high and expects a further and substantial decline. A few mills have eliminated overtime payments, but the more common practice at mills and furnaces in the north is to pay 33c. or 37c. for common labor, with time and a half for the hours in excess of eight. In 1913 the prevailing rate was 19c., without overtime, while in 1898 the common rate was 13c.

PROSPECTS

The demand for steel having shown no tendency to revive, it is considered probable that as July, always a dull month, is approached the demand will grow lighter still, an operation averaging less than 25 per cent of capacity for the steel industry as a whole being in prospect. From such a low rate of operation a rebound seems unavoidable, and improvement is very commonly predicted for August, though from the present outlook anything like full operation is not expected before next spring. The steel industry's capacity being very large, practically unanimous consent of all fundamental conditions is requisite to full employment. All lines of steel consumption must be active, and to be active they must have sound economic conditions. In other words, the cost of consuming steel must be greatly reduced, both the labor cost of the consuming or fabricating operations and the cost of the materials other than steel that are used in conjunction with steel.

PIG IRON

Quotations remain at \$24 for bessemer, \$22 for basic and \$23.50 for foundry, f.o.b. valley furnaces, freight to Pittsburgh being \$1.96. Sales have been few and in very small lots. On competitive business for a few hundred tons the foundry iron quotation would probably be shaded.

COKE

Connellsville coke remains quotable at \$3.25@\$3.50 for furnace and at \$5@\$5.50 for foundry per net ton at ovens. Some particularly good grades for furnace coke have brought \$3.75, for purposes other than iron making, and it is reported that coke for making low-phosphorus iron has sold at \$3.75, on a contract for several months.

Ammonium sulphate.....100 lb.	2.50 - 2.75	2.80 - 2.90
Amylacetate.....gal.	—	4.00 - 4.25
Amylacetate tech.....gal.	—	2.50 - 3.00
Arsenic oxide, (white arsenic) powdered lb.	.07 - .08	.08 - .08 1/2
Arsenic, sulphide, powdered (red arsenic) lb.	.12 - .12 1/2	.13 - .14
Barium chloride.....ton	58.00 - 59.00	60.00 - 65.00
Barium dioxide (peroxide).....lb.	.19 - .20	.21 - .22
Barium nitrate.....lb.	.08 - .09	.09 - .10
Barium sulphate (precip.) (blanc fixe) lb.	.04 - .05	.05 - .06
Bleaching powder (see calc. hypochlorite).....lb.	—	—
Blue vitriol (see copper sulphate).....lb.	—	—
Borax (see sodium borate).....lb.	—	—
Bristone (see sulphur, roll).....lb.	—	—
Bromine.....lb.	.41 - .42	.43 - .45
Calcium acetate.....100 lbs.	2.00 - 2.05	—
Calcium carbide.....lb.	.05 - .05 1/2	.06 - .05 1/2
Calcium chloride, fused, lump.....ton	24.00 - 25.00	26.00 - 27.00
Calcium chloride, granulated.....lb.	.01 - .02	.02 - .02 1/2
Calcium hypochlorite (bleach'g powder) 100 lb.	2.25 - 2.40	2.50 - 2.75
Calcium peroxide.....lb.	—	1.40 - 1.50
Calcium phosphate, tribasic.....lb.	—	.15 - .16
Camphor.....lb.	—	.65 - .67
Carbon bisulphide.....lb.	.07 - .07 1/2	.07 - .08
Carbon tetrachloride, drums.....lb.	.10 - .10 1/2	.11 - .12
Carbonyl chloride (phosgene).....lb.	—	.75 - 1.00
Caustic potash (see potassium hydroxide).....lb.	—	—
Caustic soda (see sodium hydroxide).....lb.	—	—
Chlorine, gas, liquid-cylinders (100 lb.).....lb.	.08 - .09	.09 - .10
Chloroform.....lb.	—	.42 - .44
Cobalt oxide.....lb.	—	3.00 - 3.10
Copperas (see iron sulphate).....lb.	—	—
Copper carbonate, green precipitate.....lb.	.20 - .21	.22 - .23
Copper cyanide.....lb.	—	.50 - .62
Copper sulphate, crystals.....lb.	.05 - .05 1/2	.06 - .06 1/2
Cream of tartar (see potassium bitartrate).....lb.	—	—
Epsom salt (see magnesium sulphate).....lb.	—	—
Ethyl Acetate Com. 85%.....gal.	—	1.00 - 1.05
Ethyl Acetate pure (acetic ether 98% to 100%).....lb.	—	.50 - .52
Formaldehyde, 40 per cent.....lb.	.14 - .14 1/2	.15 - .15 1/2
Fusel oil, ref.....gal.	—	3.00 - 3.25
Fusel oil, crude.....gal.	—	1.75 - 2.00
Glauber's salt (see sodium sulphate).....lb.	—	.17 - .17 1/2
Glycerine, C. P. drums extra.....lb.	—	3.75 - 3.85
Iodine, resublimed.....lb.	—	.10 - .20
Iron oxide, red.....lb.	—	.50 - .75
Iron sulphate (copperas).....100 lb.	1.00 - 1.25	—
Lead acetate.....lb.	—	.11 - .13 1/2
Lead arsenate, paste.....lb.	.09 - .09 1/2	.10 - .11
Lead nitrate.....lb.	—	.15 - .20
Litharge.....lb.	.08 - .09	.09 - .10
Lithium carbonate.....lb.	—	1.30 - 1.40
Magnesium carbonate, technical.....lb.	.09 - .09 1/2	.10 - .11
Magnesium sulphate, U. S. P.....100 lb.	2.75 - 3.00	—
Magnesium sulphate, technical.....100 lb.	—	1.10 - 2.25
Methanol, 95%.....gal.	—	.75 - .77
Methanol, 97%.....gal.	—	.78 - .82
Nickel salt, double.....lb.	—	.14 - .14 1/2
Nickel salt, single.....lb.	—	.15 - .15 1/2
Phosgene (see carbonyl chloride).....lb.	—	—
Phosphorus, red.....lb.	.45 - .46	.47 - .50
Phosphorus, yellow.....lb.	—	.35 - .37
Potassium bichromate.....lb.	.11 - .11 1/2	.12 - .12 1/2

		Carlots	Less Carlots
Potassium bitartrate (cream of tartar)	lb.	\$ \$	\$0.31 - \$0.32
Potassium bromide, granular	lb.		.16 - .25
Potassium carbonate, U. S. P.	lb.	.35 - .40	.45 - .50
Potassium carbonate, 80-85%	lb.	.06 - .06½	.06½ - .07½
Potassium chlorate, crystals	lb.	.08½ - .10	.10½ - .14
Potassium cyanide	lb.		.26 - .28
Potassium hydroxide (caustic potash)	lb.	.05½ - .05¾	.06 - .08
Potassium muriate	ton	50.00 - 53.00	
Potassium iodide	lb.		2.75 - 3.00
Potassium nitrate	lb.	.09½ - .09¾	.10 - .12½
Potassium permanganate	lb.	.35 - .35	.37 - .38
Potassium prussiate, red	lb.	.35 - .37	.38 - .40
Potassium prussiate, yellow	lb.	.26 - .26½	.27 - .28
Potassium sulphate (powdered)	per unit		1.50 - 1.75
Rochelle salts (see sodium potas. tartrate)			
Salammoniac (see ammonium chloride)			
Sal soda (see sodium carbonate)			
Salt cake	ton		32.00 - 33.00
Silver cyanide	oz.		1.35 - 1.38
Silver nitrate	oz.		.41 - .42
Soda ash, light	100 lb.	2.15 - 2.20	2.40 - 2.60
Soda ash, dense	100 lb.	2.40 - 2.45	2.50 - 2.75
Sodium acetate	lb.	.04½ - .04¾	.05 - .05½
Sodium bicarbonate	100 lb.	2.25 - 2.40	2.50 - 2.75
Sodium bichromate	lb.	.08 - .08½	.08½ - .09
Sodium bisulphate (nitre cake)	ton	5.00 - 5.25	5.50 - 6.50
Sodium bisulphite powdered, U. S. P.	lb.	.05½ - .05¾	.05½ - .06
Sodium borate (borax)	lb.	.06½ - .06¾	.07 - .07½
Sodium carbonate (sal soda)	100 lb.	1.50 - 2.00	2.10 - 2.40
Sodium chloride	lb.	.07½ - .07¾	.08 - .08½
Sodium cyanide	lb.	.22 - .24	.25 - .30
Sodium fluoride	lb.	.12 - .12½	.13 - .14
Sodium hydroxide (caustic soda)	100 lb.	3.85 - 3.90	4.00 - 4.50
Sodium hyposulphite	lb.		.03½ - .03¾
Sodium nitrate	100 lb.	2.90 -	3.00 -
Sodium nitrite	lb.	.07½ - .08	.08½ - .10
Sodium peroxide, powdered	lb.	.25 - .26	.27 - .30
Sodium phosphate, dibasic	lb.	.04½ - .04¾	.05 - .05½
Sodium potassium tartrate (Rochelle salts)	lb.		.27 - .28
Sodium prussiate, yellow	lb.	.12½ - .13	.13½ - .14
Sodium silicate, solution (40 deg.)	lb.	1.25 - 1.35	1.40 - 1.50
Sodium silicate, solution (60 deg.)	lb.	.02½ - .03	.03½ - .03¾
Sodium sulphate, crystals (Glauber's salt)	100 lbs.	1.50 - 1.75	2.00 - 2.25
Sodium sulphide, fused, 60-62 per cent (conc.)	lb.	.05½ - .05¾	.06 - .06½
Sodium sulphite, crystals	lb.	.03½ - .04	.04½ - .04¾
Strontium nitrate, powdered	lb.	.15 - .15	.16 - .17
Sulphur chloride, red	lb.	.07 - .07½	.07½ - .08
Sulphur, crude	ton	20.00 - 22.00	
Sulphur dioxide, liquid, cylinders ex. l.	lb.	.08 - .08½	.09 - .10
Sulphur (sublimed), flour	100 lb.		2.25 - 3.10
Sulphur, roll (brimstone)	100 lb.		2.00 - 2.75
Tin bichloride, 50 per cent	lb.	.18 - .19	
Tin oxide	lb.		.40 - .42
Zinc carbonate, precipitate	lb.	.16 - .18	.19 - .20
Zinc chloride, gran.	lb.	.11 - .11½	.11½ - .12
Zinc cyanide	lb.	.45 - .49	.50 - .60
Zinc dust	lb.	.12 - .13	.13½ - .14
Zinc oxide, XX	lb.	.08½ - .09	.09½ - .10
Zinc sulphate	lb.	.03½ - .03¾	.04 - .05

Coal-Tar Products

NOTE—The following prices are for original packages in large quantities:

Alpha-naphthol, crude	lb.	\$1.10 - \$1.15
Alpha-naphthol, refined	lb.	1.25 - 1.30
Alpha-naphthylamine	lb.	.35 - .40
Aniline oil, drums extra	lb.	.20 - .25
Aniline salts	lb.	.26 - .29
Anthracene, 80% in drums (100 lb.)	lb.	.85 - 1.00
Benzaldehyde U. S. P.	lb.	1.50 -
Benzidine, base	lb.	.85 - 1.00
Benzidine sulphate	lb.	.75 - .85
Benzoic acid, U. S. P.	lb.	.65 - .70
Benzoate of soda, U. S. P.	lb.	.65 - .70
Benzene, pure, water-white, in drums (100 gal.)	gal.	.27 - .32
Benzene, 90% in drums (100 gal.)	gal.	.25 - .28
Benzyl chloride, 95-97%, refined	lb.	.28 - .30
Benzyl chloride, tech.	lb.	.20 - .25
Beta-naphthol benzoate	lb.	3.50 - 4.00
Beta-naphthol, sublimed	lb.	.70 - .75
Beta-naphthol, tech.	lb.	.34 - .45
Beta-naphthylamine, sublimed	lb.	2.00 - 2.25
Cresol, U. S. P., in drums (100 lb.)	lb.	.16 - .18
Ortho-cresol, in drums (100 lb.)	lb.	.25 - .27
Cresylic acid, 97-99%, straw color, in drums	gal.	.70 - .80
Cresylic acid, 75-97%, dark, in drums	gal.	.65 - .70
Cresylic acid, 50%, first quality, drums	gal.	.45 - .50
Dichlorobenzene	lb.	.06 - .09
Diethylaniline	lb.	1.20 - 1.25
Dimethylaniline	lb.	.41 - .50
Dinitrobenzene	lb.	.32 - .35
Dinitrochlorobenzene	lb.	.20 - .30
Dinitronaphthalene	lb.	.30 - .40
Dinitrophenol	lb.	.35 - .40
Dinitrotoluene	lb.	.27 - .30
Dip oil, 25%, car lots, in drums	gal.	.40 - .45
Diphenylamine	lb.	.60 - .65
H-acid	lb.	1.30 - 1.50
Meta-phenylenediamine	lb.	1.15 - 1.20
Monochlorobenzene	lb.	.12 - .14
Monothylaniline	lb.	1.75 - 1.85
Naphthalene crushed, in bbls.	lb.	.07½ - .08½
Naphthalene, flake	lb.	.07½ - .08½
Naphthalene, balls	lb.	.08½ - .09½
Naphthionic acid, crude	lb.	.70 - .75
Nitrobenzene	lb.	.12 - .15
Nitronaphthalene	lb.	.30 - .35
Nitro-toluene	lb.	.16 - .18
Ortho-amidophenol	lb.	3.10 - 3.20
Ortho-dichlorobenzene	lb.	.15 - .20
Ortho-nitro-phenol	lb.	.80 - .85
Ortho-nitro-toluene	lb.	.15 - .20
Ortho-toluidine	lb.	.20 - .25
Para-amidophenol, base	lb.	1.50 - 1.60
Para-amidophenol, HCl	lb.	1.75 - 1.80

Para-dichlorobenzene	lb.	.15 - .20
Paranitroaniline	lb.	.85 - 1.00
Para-nitrotoluene	lb.	.90 - 1.00
Para-phenylenediamine	lb.	1.25 - 2.00
Para-toluidine	lb.	1.25 - 1.40
Phthalic anhydride	lb.	.50 - .60
Phenol, U. S. P., drums	lb.	.10 - .14
Pyridine	gal.	2.00 - 3.50
Resorcinol, technical	lb.	1.75 - 1.85
Resorcinol, pure	lb.	2.25 - 2.30
Salicylic acid, tech., in bbls.	lb.	.22 - .24
Salicylic acid, U. S. P.	lb.	.26 - .28
Salol	lb.	.85 - .95
Solvent naphtha, water-white, in drums, 100 gal.	gal.	.25 - .28
Solvent naphtha, crude, heavy, in drums, 100 gal.	gal.	.14 - .16
Sulphanilic acid, crude	lb.	.30 - .35
Tolidine	lb.	1.25 - 1.35
Toluidine, mixed	lb.	.40 - .45
Toluene, in tank cars	gal.	.25 - .28
Toluene, in drums	gal.	.28 - .31
Xylidine, drums, 100 gal.	lb.	.40 - .45
Xylene, pure, in drums	gal.	.40 - .45
Xylene, pure, in tank cars	gal.	.45 -
Xylene, commercial, in drums, 100 gal.	gal.	.33 - .35
Xylene, commer. l., in tank cars	gal.	.30 -

Waxes

Prices based on original packages in large quantities.

Beeswax, refined, dark	lb.	\$0.24 - \$0.25
Beeswax, refined, light	lb.	.28 - .30
Beeswax, white pure	lb.	.45 - .47
Carnauba, Fla.	lb.	.60 - .61
Carnauba, No. 2, North Country	lb.	.28 - .30
Carnauba, No. 3, North Country	lb.	.16 - .17
Japan	lb.	.18 - .18½
Montan, crude	lb.	.07 - .07½
Paraffine waxes, crude match wax (white) 105-110 m.p.	lb.	.03½ - .03¾
Paraffine waxes, crude, scale 124-126 m.p.	lb.	.02½ - .03
Paraffine waxes, refined, 118-120 m.p.	lb.	.03½ - .03¾
Paraffine waxes, refined, 125 m.p.	lb.	.04½ - .04¾
Paraffine waxes, refined, 128-130 m.p.	lb.	.04½ - .05
Paraffine waxes, refined, 133-135 m.p.	lb.	.05 - .05½
Paraffine waxes, refined, 135-137 m.p.	lb.	.05½ - .06
Stearic acid, single pressed	lb.	.09 -
Stearic acid, double pressed	lb.	.10 -
Stearic acid, triple pressed	lb.	.11 - .11½

Naval Stores

All prices are f.o.b. New York unless otherwise stated, and are based on carload lots. The oils in 50-gal. bbls., gross weight, 500 lb.

Rosin B-D, bbl.	280 lb.	\$5.10 -
Rosin E-I	280 lb.	5.80 - 6.60
Rosin K-N	280 lb.	6.50 - 6.70
Rosin W. G.-W. W.	280 lb.	6.80 -
Wood rosin, bbl.	280 lb.	6.25 -
Spirits of turpentine	gal.	.69 -
Wood turpentine steam dist.	gal.	.67 -
Wood turpentine, dest. dist.	gal.	.65 -
Pine tar pitch, bbl.	200 lb.	 - 6.75
Tar, kiln burned, bbl. (500 lb.)	bbl.	 - 12.00
Retort tar, bbl.	500 lb.	 - 12.00
Rosin oil, first run	gal.	.36 -
Rosin oil, second run	gal.	.38 -
Rosin oil, third run	gal.	.43 -
Pine oil, steam dist., sp.gr. 0.930-0.940	gal.	1.80 -
Pine oil, pure, dest. dist.	gal.	1.50 -
Pine tar oil, ref., sp.gr. 1.025-1.035	gal.	.46 -
Pine tar oil, crude, sp.gr. 1.025-1.035 tank cars f.o.b. Jacksonville, Fla.	gal.	.35 -
Pine tar oil, double ref., sp.gr. 0.965-0.990	gal.	.75 -
Pine tar, ref., thin, sp.gr. 1.080-1.960	gal.	.35 -
Turpentine, crude, sp.gr. 0.900-0.970	gal.	1.20 -
Hardwood oil, f.o.b. Mich., sp.gr. 0.960-0.990	gal.	.35 -
Pinewood creosote, ref.	gal.	.52 -

Solvents

73-76 deg., steel bbls. (85 lb.)	gal.	\$0.41 -
70-72 deg., steel bbls. (85 lb.)	gal.	.39 -
68-70 deg., steel bbls. (85 lb.)	gal.	.38 -
V. M. and P. naphtha, steel bbls. (85 lb.)	gal.	.30 -

Crude Rubber

Para-Upriver fine	lb.	\$0.16 - .17
Upriver coarse	lb.	.09 - .09½
Upriver caucho ball	lb.	.11½ - .12
Plantation—First latex crepe	lb.	.18 -
Ribbed smoked sheets	lb.	.16 - .16½
Brown crepe, thin, clean	lb.	.15 -
Amber crepe No. 1	lb.	.17 -

Oils

VEGETABLE

The following prices are f.o.b. New York for carload lots.

Castor oil, No. 3, in bbls.	lb.	\$0.09½ - \$0.09¾
Castor oil, AA, in bbls.	lb.	.10 - .10½
China wood oil, in bbls. (f.o.b. Pac. coast)	lb.	.11½ - .12
Cocoonut oil, Ceylon grade, in bbls.	lb.	.10½ - .10¾
Cocoonut oil, Cochín grade, in bbls.	lb.	.11½ - .11¾
Corn oil, crude, in bbls.	lb.	.07½ - .08
Cottonseed oil, crude (f. o. b. mill)	lb.	.05½ - .05¾
Cottonseed oil, summer yellow	lb.	.07½ - .08
Cottonseed oil, winter yellow	lb.	.08 -
Linseed oil, raw, car lots (domestic)	gal.	.73 - .73
Linseed oil, raw, tank cars (domestic)	gal.	.67 -
Linseed oil, in 5-bbl lots (domestic)	gal.	.76 - .76

Olive oil, Denatured.....	gal.	\$1.35	—	\$1.58
Palm, Lagos.....	lb.	.07	—	.07
Palm, Niger.....	lb.	.05	—	.06
Peanut oil, crude, tank cars (f.o.b. mill).....	lb.	.06	—	.06
Peanut oil, refined, in bbls.....	lb.	.10	—	.10
Rapeseed oil, refined in bbls.....	gal.	.86	—	.88
Rapeseed oil, blown, in bbls.....	gal.	.92	—	.94
Soya bean oil (Manchurian), in bbls. N. Y.....	lb.	.07	—	.07
Soya bean oil, tank cars, f.o.b., Pacific coast.....	lb.	.05	—	

FISH

Light pressed menhaden.....	gal.	\$0.40	—	\$0.41
Yellow bleached menhaden.....	gal.	.42	—	
White bleached menhaden.....	gal.	.44	—	
Blown menhaden.....	gal.	.80	—	

Miscellaneous Materials

All f.o.b. New York Unless Otherwise Stated

Barytes, ground, white, f.o.b. Kings Creek, S. C.....	net ton	\$24.00	—	30.00
Barytes, ground, off color, f.o.b. Kings Creek.....	net ton	22.00	—	26.00
Barytes, crude, 88% @ 94% ba., Kings Creek.....	net ton	10.00	—	1.00
Barytes, floated, f.o.b. St. Louis.....	net ton	26.50	—	28.00
Barytes, crude, first grade, Missouri.....	net ton	7.00	—	
Blanc fixe, dry.....	lb.	.05	—	.05
Blanc fixe, pulp.....	net ton	50.00	—	60.00
Casein.....	lb.	.14	—	.16
Chalk, domestic, extra light.....	lb.	.05	—	.05
Chalk, domestic, light.....	lb.	.04	—	.05
Chalk, domestic, heavy.....	lb.	.04	—	.05
Chalk, English, extra light.....	lb.	.05	—	.07
Chalk, English, light.....	lb.	.05	—	.06
Chalk, English, dense.....	lb.	.04	—	.05
China clay (kaolin) crude, f.o.b. mines, Georgia.....	net ton	8.00	—	10.00
China clay (kaolin) washed, f.o.b. Georgia.....	net ton	12.00	—	15.00
China clay (kaolin) powdered, f.o.b. Georgia.....	net ton	18.00	—	22.00
China clay (kaolin) crude f.o.b. Virginia points.....	net ton	8.00	—	12.00
China clay (kaolin) ground, f.o.b. Virginia points.....	net ton	15.00	—	40.00
China clay (kaolin), imported, lump.....	net ton	23.00	—	25.00
China clay (kaolin), imported, powdered.....	net ton	30.00	—	35.00
Feldspar, crude, f.o.b. Maryland and North Carolina points.....	gross ton	8.00	—	14.00
Feldspar, crude, f.o.b. Maine.....	net ton	7.50	—	10.00
Feldspar, ground, f.o.b. Maine.....	net ton	21.00	—	23.00
Feldspar, ground, f.o.b. North Carolina.....	net ton	17.00	—	21.00
Feldspar, ground, f.o.b. N. Y. State.....	net ton	17.00	—	21.00
Feldspar, ground, f.o.b. Baltimore.....	net ton	27.00	—	30.00
Fullers earth, f.o.b. Mines.....	net ton	16.00	—	17.00
Fullers earth, granular, f.o.b. Pa.....	net ton	15.00	—	18.00
Fullers earth, powdered, f.o.b. Fla.....	net ton	18.00	—	
Fullers earth, imported, powdered.....	net ton	24.00	—	27.00
Graphite, Ceylon lump, first quality.....	lb.	.07	—	.08
Graphite, Ceylon chip.....	lb.	.06	—	.06
Graphite, high grade amorphous crude.....	lb.	.02	—	.03
Pumice stone, imported, lump.....	lb.	.04	—	.50
Pumice stone, domestic lump.....	lb.	.05	—	.05
Pumice stone, ground.....	lb.	.06	—	.07
Quartz (acid tower) first to head, f.o.b. Baltimore.....	net ton		—	10.00
Quartz (acid tower) 1 1/2 @ 2 in., f.o.b. Baltimore.....	net ton		—	14.00
Quartz (acid tower) rice, f.o.b. Baltimore.....	net ton		—	17.00
Quartz, lump, f.o.b. North Carolina.....	net ton	5.00	—	7.50
Shellac, orange fine.....	lb.	.75	—	
Shellac, orange superfine.....	lb.	.79	—	.82
Shellac, A. C. garnet.....	lb.	.55	—	.58
Shellac, T. N.....	lb.	.70	—	.72
Soapstone.....	ton	12.00	—	15.00
Sodium chloride.....	long ton	12.50	—	13.00
Talc, paper-making grades, f.o.b. Vermont.....	ton	11.00	—	20.00
Talc, roofing grades, f.o.b. Vermont.....	ton	8.50	—	13.00
Talc, rubber grades, f.o.b. Vermont.....	ton	11.00	—	18.00
Talc, powdered, Southern, f.o.b. cars.....	ton	10.00	—	14.00
Talc, imported.....	ton	35.00	—	40.00
Talc, California talcum powder grade.....	ton	18.00	—	40.00

Refractories

Bauxite brick, 56% Al, f.o.b. Pittsburgh.....	per ton	\$35.00—50.00
Carborundum refractory brick, 9-in.....	1,000	1250.00
Chrome brick, f.o.b. Eastern shipping points.....	net ton	75—90
Chrome cement, 40—45% Cr ₂ O ₃	net ton	45—50
Chrome cement, 40—45% Cr ₂ O ₃ , sacks, in car lots, f.o.b. Eastern shipping points.....	net ton	 55
Fireclay brick, 1st quality, 9-in. shapes, f.o.b. Pennsylvania, Ohio and Kentucky works.....	1,000	40—50
Fireclay brick, 2nd quality, 9-in. shapes, f.o.b. Pennsylvania, Ohio and Kentucky works.....	1,000	40—50
Magnesite brick, 9-in. straight.....	net ton	90
Magnesite brick, 9-in. arches, wedges and keys.....	net ton	100
Magnesite brick, soaps and splits.....	net ton	110
Silica brick, 9-in. sizes, f.o.b. Chicago district.....	1,000	45—55
Silica brick, 9-in. sizes, f.o.b. Birmingham district.....	1,000	45—55
Silica brick, 9-in. sizes, f.o.b. Mt. Union, Pa.....	1,000	45—55

Ferro-Alloys

All f.o.b. Works

Ferro-titanium, 15-18%, f.o.b. Niagara Falls, N. Y.....	net ton	\$200.00 — \$225.00
Ferrochrome per lb. of Cr. contained, 6-8% carbon, carlots.....	lb.	.15 — .16
Ferrochrome, per lb. of Cr. contained, 4-6% carbon, carlots.....	lb.	.16 — .17
Ferromanganese, 76-80% Mn, domestic.....	gross ton	80.00 — 85.00
Ferromanganese, 76-80% Mn, English.....	gross ton	80.00 — 85.00
Spiegelisen, 18-22% Mn.....	gross ton	30.00 — 32.00
Ferromolybdenum, 50-60% Mo, per lb. of Mo.....	lb.	2.50 —
Ferrosilicon, 10-15%.....	gross ton	50.00 — 55.00
Ferrosilicon, 50%.....	gross ton	80.00 — 85.00
Ferrosilicon, 75%.....	gross ton	145.00 — 150.00
Ferrotungsten, 70-80%, per lb. of contained W.....	lb.	.45 — .50
Ferrouuranium, 35-50% of U, per lb. of U content.....	lb.	6.00 —
Ferrovanadium, 30-40% per lb. of contained V.....	lb.	5.00 — 6.50

Ores and Semi-finished Products

All f.o.b. New York, Unless Otherwise Stated

Bauxite, 52% Al content.....	gross ton	\$8.00 — \$10.00
Chrome ore, Calif. concentrates, 50% Cr ₂ O ₃	unit	45 — .50
Chrome ore, 50% Cr ₂ O ₃ , f.o.b. Atlantic seaboard.....	unit	45 — .50
Coke, foundry, f.o.b. ovens.....	net ton	4.50 — 5.00
Coke, furnace, f.o.b. ovens.....	net ton	3.25 — 3.75
Coke, petroleum, refinery, Atlantic seaboard.....	net ton	15.00 — 16.00
Fluorspar, lump, f.o.b. mines, New Mexico.....	net ton	15.00 —
Fluorspar, standard, domestic washed gravel.....	net ton	20.00 — 22.50
Ilmenite, 52% TiO ₂ , per lb. ore.....	lb.	.01 — .01
Manganese ore, 50% Mn, c.i.f. Atlantic seaport.....	unit	.25 —
Manganese ore, chemical (Mn ₂ O ₃).....	gross ton	60.00 — 65.00
Molybdenite, 85% MoS ₂ , per lb. of MoS ₂ , N. Y.....	lb.	.55 — .60
Monazite, per unit of ThO ₂ , c.i.f. Atlantic seaport.....	unit	30.00 —
Pyrites, Spanish, fine, c.i.f. Atlantic seaport.....	unit	14 — 14
Pyrites, Spanish, furnace size, c.i.f. Atlantic seaport.....	unit	.14 — .14
Pyrites, domestic, fines, f.o.b. mines, Ga.....	unit	.12 — .13
Rutile, 95% TiO ₂ per lb. ore.....	lb.	.15 —
Tungsten, scheelite, 60% WO ₃ and over, per unit of WO ₃ (nominal).....	unit	2.75 — 3.00
Tungsten, Wolframite, 60% WO ₃ and over, per unit of WO ₃ , N. Y. C.....	unit	3.00 — 3.25
Uranium ore (carnotite) per lb. of U ₃ O ₈	lb.	1.50 — 2.50
Uranium oxide, 96% per lb. contained U ₃ O ₈	lb.	2.25 — 2.50
Vanadium pentoxide, 99%.....	lb.	12.00 — 14.00
Vanadium ore, per lb. of V ₂ O ₅ contained.....	lb.	1.50 —
Zircon, washed, iron free.....	lb.	.03 —

Plates, 1/2 to 1 in. thick.....	2.50	3.30	3.23

*Add 15c per 100 lb. for trucking to Jersey City and 10c for delivery in New York and Brooklyn

Industrial

Financial, Construction and Manufacturers' News

Construction and Operation

Alabama

MOBILE—The Gilman Paint & Varnish Co., Chattanooga, Tenn., is planning for the establishment of a local plant to be equipped for a capacity of about 2,000 gal. of material per day. K. Y. Benson is vice-president.

Arkansas

LITTLE ROCK—The Rose City Petroleum Co., 407 Donaghey Bldg., recently organized with a capital of \$500,000, has plans under way for the erection of a new oil-refining plant on local site, to have an initial capacity of about 1,000 bbl. per day. A. M. Delcambre is president and E. B. Fowler secretary and treasurer.

PICRON—The Arkansas Refineries Co., Little Rock, recently incorporated with a capital of \$50,000, is planning for the erection of a new oil refinery at Picron, with initial daily capacity of about 500 bbl. Brooks & Co., Little Rock, will be in charge of erection. Joseph Berger is president.

California

LOS ANGELES—The C. F. Braun Co., San Francisco, manufacturer of metal products, is planning for the removal of its foundries to a site to be selected at Los Angeles. Details of the new plant are being arranged.

PITTSBURG—S. M. Stranahan and J. F. Mora, Pittsburg, are planning for the erection of a new plant at Martinez for the manufacture of a new airless automobile tire and other rubber products. Negotiations are under way with the Board of City Trustees for a suitable site.

Delaware

CLAYMONT—The Wilmington Sugar Refining Co., Wilmington, will resume work at once on its proposed new sugar refinery at Claymont, estimated to cost about \$1,000,000 with machinery. The company has a tract of about 11 acres of land, purchased from the Pennsylvania R.R., and a number of buildings will be constructed. The company is capitalized at \$30,000,000 and is headed by Adolph Segal, 1710 North 23d St., Philadelphia, Pa.

Georgia

CEDARTOWN—The Brewer Automobile Headlight Co., recently organized, is arranging for the operation of a local plant for the manufacture of automobile headlights and fixtures. I. L. St. Clair is president and general manager.

Indiana

BRAZIL—Officials of the Kalamazoo Tank & Silo Co., operating a local plant for the manufacture of burned clay products, have organized the Kalamazoo Clay Co. The new organization has acquired the property of the Carbon Mining Co., near Brazil, and will establish a works here for the manufacture of burned clay blocks and kindred products. The company is headed by Manvel H. Coombs, James E. Anderson and John S. Rockwell.

ELKHART—The American Coating Mills, manufacturer of enameled paper products, have awarded a contract to Henry L. Vanderhouse, Kalamazoo, Mich., for the erection of the proposed addition to its plant, to be located at the foot of Division St. The new factory with machinery is estimated to cost in excess of \$500,000. C. C. Colbert is president and treasurer.

Iowa

DAVENPORT—The Western States Portland Cement Co., Independence, Kan., has construction under way on its new local cement mills, estimated to cost close to \$2,000,000 with machinery. A. D. Stancliff is purchasing agent.

Louisiana

MONROE—The Monroe Cotton Oil Co., Newtown, near Monroe, is reported to be planning for the rebuilding of its plant,

destroyed by fire May 11 with loss estimated at about \$150,000, including equipment.

Maryland

HAGERSTOWN—Fire May 15 destroyed a portion of the mixing plant of the Central Chemical Co., manufacturer of fertilizer products, with loss estimated at about \$35,000, including machinery.

Massachusetts

CHESTER—The Cortland Grinding Wheel Co., Cortland, N. Y., has combined operations with the Maxf Grinding Wheel Co., operating a local plant, and the products of both companies will be made in the future at this location. The plant of the Cortland company was destroyed by fire last November, and it is said that it will not be rebuilt at the present time. The officers of both companies will remain as heretofore.

Michigan

THREE RIVERS—The Eddy Paper Co. has arranged for a bond issue of \$1,250,000 to be used for general operations, financing, etc. The company's plant has a total capacity of about 100,000 tons of paper per year, with branch works at White Pigeon, Mich.

CHEBOYGAN—The Union Bag & Paper Co. has awarded a contract to J. Livingston & Co., 506 Sloan Bldg., Cleveland, O., for extensions and improvements in its paper mill. A portion of the works will be remodeled. G. S. Witham is general superintendent.

Missouri

PIEDMONT—The Piedmont Units Co. has acquired a tract of land totaling about 6,500 acres, and is planning for the erection of a new plant for the production of charcoal and byproducts. The initial works will comprise a battery of 7 ovens and auxiliary operating equipment. About \$100,000 will be expended in the new plant and in property development.

SPRINGFIELD—The Willis-Smiley Producing & Refining Co., Fort Scott, Kan., recently organized, has plans under way for the erection of a new oil refinery in the vicinity of Springfield, to have an initial daily output of about 500 bbl. The plant will be arranged on the unit plan, and the first unit will be added to at a later date. W. E. Willis and W. J. Smiley, both of Fort Scott, head the company.

New Jersey

NEWARK—Aaron Friedman of the New Process Metals Co., 7 Mulberry St., is planning for the erection of a new plant for the manufacture of cerium and other rare earth metallic products.

JERSEY CITY—G. H. Aspinwall, Cornelison Ave., manufacturer of paints, will take bids at once for the erection of a new 2-story plant, 50x60 ft., to cost about \$30,000, including equipment. E. M. Patterson, 76 Montgomery St., is architect.

WOODSTOWN—The South Jersey Farmers' Exchange is considering plans for the construction of a new 1-story addition to its fertilizer plant, about 80x200 ft. A. B. Lippincott is manager.

MAURER—The Barber Asphalt Paving Co., Land Title Bldg., Philadelphia, Pa., has awarded a contract for the erection of a new service building at its local plant, 32x52 ft., to J. H. Wester, 221 Brighton Ave., Perth Amboy, N. J.

New York

SYRACUSE—The Thatcher Process Co., organized about a year ago and operating with a capital of \$200,000, has commenced production at its new local electrochemical plant for the manufacture of anthraquinone under a special process. The initial output will average about 1,000 lb. per day, and this will be increased at a later date. The company is headed by Carleton A. Chase and James D. Grant.

NEW YORK—The Ruberoid Co., Woolworth Bldg., formerly the Standard Paint Co., has arranged for a bond issue of \$1,

000,000 for general operations, financing, etc. H. F. Gillespie is vice-president.

ALBANY—The Hires-Turner Glass Co., 30th and Walnut Sts., Philadelphia, Pa., manufacturer of window glass and other rolled glass products, is taking bids for the erection of a new one-story plant on Tivoli St., Albany, to be 150x300 ft., steel and concrete, and estimated to cost about \$250,000 with machinery. A. W. Fuller, 95 State St., Albany, is architect.

DUNKIRK—The Thatcher Mfg. Co., 201 West Second St., manufacturer of glass products, is taking bids for the erection of a new 1-story plant to replace a portion of its works recently destroyed by fire.

North Carolina

HENDERSON—The Vance Fertilizer Co. has commenced the erection of a new local plant, to be equipped for the manufacture of commercial fertilizers.

WILMINGTON—The Atlantic Refining Co., 3144 Passyunk Ave., Philadelphia, Pa., is reported to have purchased the Naull Shipyard, on the Cape Fear River, near Wilmington, and has plans under way for the erection of a large oil refinery on the site.

WILMINGTON—Fire recently destroyed a portion of the plant of the Shepard Chemical Co. No official estimate of loss has been made. Plans are said to be under way for rebuilding. E. C. Dickinson is head.

Ohio

CUYAHOGA FALLS—The Surgeons' Rubber Glove Co., manufacturer of rubber goods, has plans under way for the erection of a new plant. The Akron Engineering Co., Akron, O., is engineer. C. N. Shook, 410 Merline Ave., Cuyahoga Falls, is one of the heads of the company.

CORTLAND—The Quinley Magnesia Co., recently organized with a capital of \$100,000, will soon break ground for the erection of a new plant for the manufacture of magnesium and asphalt products. The initial output will aggregate about 4,000 lb. of magnesium carbonate per day. It is proposed to have the first plant unit ready for service during July.

Quebec

EAST ANGUS—The Brompton Pulp & Paper Co. is planning for the rebuilding of the portion of its local mill, destroyed by fire, May 5. The company has arranged for a bond issue of \$2,500,000, the proceeds to be used for general operations, expansion, etc. In addition to the East Angus plant, mills are being operated at Bromptonville, Que., Claremont, N. H., and Groveton, N. H., with total annual production of 123,000 tons of newsprint, kraft and fiber paper and groundwood pulp. F. N. McCrea is president.

South Carolina

ALLENDALE—Fire, May 16, destroyed a portion of the plant of the Allendale Cotton Oil & Fertilizer Co., with loss estimated at about \$75,000, including equipment and stock.

Tennessee

MEMPHIS—The Memphis Packing Corp., Falls Building, is considering the erection of a new local plant for the manufacture of compounds. The refinery will be operated in conjunction with the present works. Joseph Newburger is president.

MEMPHIS—The Oriental Chemical Co., with offices in the Odd Fellows Bldg., plans the erection of a chemical plant in Hollywood. The officers of this company are W. L. Eichberg, president; W. W. Laughlin, vice-president and W. L. Eichberg, secretary-treasurer.

CHATTANOOGA—The Mutual Enamel Ware Co. is having plans prepared by Dwight P. Robinson & Co., 125 East 46th St., New York City, for the erection of a new local plant for the manufacture of enamel sanitary ware.

Texas

DALLAS—The Southern States Chemical Co., 1831 Clarence St., has plans under way for the erection of a new plant at Houston, comprising four complete units, two of which will be erected at the present time and the others at a later date. The larger unit will be 2 story, brick and steel, totaling about 10,000 sq. ft. of space, and will be equipped for chemical manufacture. The smaller section will be used for byproduct recovery, and will be equipped with distillation apparatus, retorts, etc. The main works will manufacture inks, paints, soaps, etc., in addition to general chemicals. Louis Rosenberg is president.

TYLER—George R. Hill and associates have plans under way for the establishment of a new brick manufacturing plant, to be equipped for a daily output of about 10,000 bricks.

West Virginia

RAVENSWOOD—The Ravenswood Porcelain Co., recently organized with a capital of \$500,000, has plans under way for the erection of a new local plant for the manufacture of electrical porcelain products, to be 1-story, 120 x 160 ft. Two kinds will be constructed. The plant is estimated to cost in excess of \$30,000 with equipment. Beaty & Halloran, New Haven, W. Va., and Cincinnati, O., are architects. C. E. Mason is president, and C. W. Turnbull, general manager.

Capital Increases, Etc.

THE IMPERIAL DROP FORGE CO., Indianapolis, Ind., has filed notice of increase in capital from \$200,000 to \$500,000.

THE STAR OIL CO., INC., Port Huron, Mich., has filed notice of increase in capital from \$65,000 to \$100,000.

THE INDIANA GLASS & FIXTURE CORP., Marion, Ind., has filed notice of change of name to the Therasse Glass Corp.

THE INTER STATE LEATHER CO., 229 West Rand St., Chicago, has filed notice of dissolution under state laws.

F. F. DALLEY CO., 321 Military Rd., Buffalo, N. Y., manufacturer of polishes, has filed notice of increase in capital from \$590,000 to \$1,340,000.

THE ROGERS RUBBER CO., Westminster, Md., manufacturer of rubber products, has filed notice of reduction in capital from \$1,000,000 to \$250,000.

THE MARION TIRE & RUBBER CO., Marion, O., manufacturer of rubber products, has filed notice of increase in capital from \$750,000 to \$1,250,000.

THE MONROE BINDER BOARD CO. and the **BOEHME & RAUCH CO.**, both of Monroe, Mich., manufacturer of paper and fiber board products, have been merged under the name of the Monroe Consolidated Paper Co., with a capital of \$7,500,000. E. C. Rauch is president.

New Companies

THE HUNTINGTON SIGNAL OIL CO., Los Angeles, Cal., has been incorporated with a capital of \$350,000 to manufacture petroleum products. The incorporators are Carlos C. Closson, 5544 Lexington St., Los Angeles; Frank W. Foster, Artesia, Cal.; and Jewel Irwin, 262 Mira Mar Ave., Long Beach, Cal.

THE FLAGG INK CO., New York City, has been incorporated with a capital of \$100,000 to manufacture inks and kindred products. The incorporators are A. B. Flagg, J. Kirschenstein and A. P. Scharps, Tribune Bldg.

THE RORK CHEMICAL CO., 3316 North Halsted St., Chicago, has been incorporated with a capital of \$25,000 to manufacture chemical and chemical byproducts. The incorporators are Fred Lackner, M. J. Clark and M. W. Rork.

THE PENNSYLVANIA CHEMICAL CO., Brooklyn, N. Y., has been incorporated with a capital of \$25,000 to manufacture chemicals and affiliated products. The incorporators are S. L. Siegler, F. C. Skinner and M. L. Lavey. J. B. Steinfeld, 215 Montague St., represents the company.

THE STANDARD METAL PRODUCTS CO., Boston, Mass., has been incorporated with a capital of \$100,000 to manufacture metal specialties. George R. Armstrong is president and Morris M. Fineberg, 34 Orange St., Chelsea, Mass., treasurer.

THE HUNTINGTON ARENA OIL CO., Los Angeles, Cal., has been incorporated with a capital of \$500,000 to manufacture petroleum products. The incorporators are J. W. LaFrange and W. A. Davidson, Los Angeles, and James E. Jeter, Glendale, Cal. H. P. Goodwin, 231 Title Insurance Bldg., Los Angeles, represents the company.

JOHN P. CARLSON, INC., Brooklyn, N. Y., has been incorporated with a capital of \$100,000 to manufacture printing and lithographic inks. The incorporators are J. P., J. R. and S. Carlson. The company is represented by Durack & Scheilke, 215 Montague St.

THE NITROLID CO., East Stroudsburg, Pa., has been incorporated with a capital of \$50,000 to manufacture pyroxylin and composition products. Julian Davis, Stroudsburg, Pa., is treasurer.

THE HERCULOID PRODUCTS CO., 7 West Madison St., Chicago, has been incorporated with a capital of \$75,000 to manufacture wood pulp products and kindred specialties. The incorporators are J. W. Young, A. S. Flett and Benjamin N. Anderson.

THE A. & T. OIL CO., Los Angeles, Cal., has been incorporated with a capital of \$750,000 to manufacture petroleum products. The incorporators are T. S. Trebell, Irving V. Augau and Harvey A. Young, 511 Stock Exchange Bldg.

THE NORTHSIDE BRICK CO., Pittsburgh, Pa., has been incorporated with a capital of \$50,000 to manufacture brick and other burned clay products. John Schlermann, Millville, Pa., is treasurer.

THE LEBANON GREY IRON CASTINGS CO., Lebanon, Pa., has been incorporated with a capital of \$30,000 to manufacture metal castings. The incorporators are Julius H. Caplan and John Hunsicker, Jr., Lebanon.

THE TRIANGLE TANNING CO., Medford, Mass., has been incorporated with a capital of \$100,000 to manufacture leather products. Herman See is president; Theodore W. Kerr, 22 Corey St., Medford, is treasurer.

THE MURRAY OIL CO., Room 640, 29 South La Salle St., Chicago, has been incorporated with a capital of 500 shares of stock, no par value, to manufacture oil products. The incorporators are Andrew C. Wylie, Charles Reagh and I. S. Berkman.

THE IMPERIAL PULP & PAPER CORP., New York City, has been incorporated with a capital of \$100,000 to manufacture pulp and paper products. The incorporators are W. H. Wilson, J. R. Allen and J. A. Montague. F. J. Knorr, Albany, N. Y., represents the company.

THE HAMILTON TILE CO., Los Angeles, Cal., has been incorporated with a capital of \$50,000 to manufacture ceramic tile and other kindred products. The incorporators are M. M. and G. B. Hamilton, and Lawrence W. Allen. Allen, Allen & Swender, Los Angeles, attorneys, represent the company.

THE GROSVENOR PAPER CO., Buffalo, N. Y., has been incorporated with a capital of \$100,000 to manufacture paper products. The incorporators are H. A. Grosvenor, E. F. Branch and P. Swift. Swift, Gratiwick & Peter Ellicott Sq., Buffalo, represent the company.

THE ATLANTIC & PACIFIC DRUG & CHEMICAL CO., Room 1438, 10 South LaSalle St., Chicago, has been incorporated with a capital of 1,000 shares of stock, no par value, to manufacture chemicals and affiliated products. The incorporators are Hubert E. Howard, John C. Burchard and Herbert Haase.

THE CONSUMERS' BOX CO., Philadelphia, Pa., is being organized by Jesse E. Perry, Ralph L. Patterson and Charles E. White, to manufacture paper boxes and containers. Samuel W. Cooper, Lincoln Bldg., represents the company.

THE LOS ANGELES TIRE & TUBE MFG. CO., 1338 East Slauson Ave., Los Angeles, Cal., has filed notice of organization to manufacture rubber products. T. J. Barker, 1140 East Sixtieth St., heads the company.

THE WENTZELL CHEMICAL DISTRIBUTING CO., New York City, has been incorporated with a capital of \$25,000 to manufacture chemical products. The incorporators are E. R. Dick, R. Moulton and E. T. Moriarity. J. P. Nolan, 25 Broad St., represents the company.

THE AIKEN OIL CO., Pittsburgh, Pa., has been organized by F. L. and Clarence Aiken, and I. M. Miller, to manufacture refined oil products. The company is represented by A. L. Petty, Jr., 1156 Frick Annex.

THE IMPERIAL VALLEY CRUDE OIL CO., Los Angeles, Cal., has been incorporated with a capital of \$1,000,000 to manufacture petroleum products. The incorporators are J. F. Corbett, C. M. Graham and Frank Muller. The company is represented by Carnahan & Clark, 501 Investment Bldg.

THE OILZUM DISTRIBUTING CO., INC., 4 East Mount Royal Ave., Baltimore, Md., has been incorporated with a capital of \$75,000 to manufacture soaps, oils and kindred products. The incorporators are L. Innes Correll, Harold Simester and F. G. Riggs.

THE PERFECT CHEMICAL MFG. & DRUG CORP. has been incorporated with a capital of \$50,000 to manufacture chemicals and affiliated products. The incorporators are B. Baum, I. Goldberg and C. Zarem. C. Firstone, 299 B'way, represents the company.

THE CALUMET MALLEABLE IRON CO., 9651 Torrance Ave., Chicago, has been incorporated with a capital of \$50,000 to manufacture iron products. The incorporators are Michael J. Boyle, George R. Barker and Thomas E. Duffy.

WENDELL & WARREN, INC., 1601 West North Ave., Baltimore, Md., has been incorporated with a capital of \$31,000 to manufacture chemicals, drug compounds, etc. The incorporators are H. George Wendell, Daniel A. Warren and R. E. Lee Williamson.

THE UNITED LABORATORIES, INC., 15 East Washington St., Chicago, has been incorporated with a capital of \$100,000 to manufacture chemical and scientific products. The incorporators are C. W. Armstrong, P. C. Hughes and R. M. Hughes.

THE FITZROY CHEMICAL CORP., New York City, has been incorporated with a capital of \$25,000 to manufacture chemicals and chemical byproducts. The incorporators are E. L. Mullaney, M. Fitzgerald and F. Persh. The company is represented by Geller & Kraushaar, 51 Chambers St.

THE ILLINOIS VARNISHED TILE CO., Room 1400, 38 South Dearborn St., Chicago, has been incorporated with a capital of \$100,000 to manufacture tile and other ceramic products. The incorporators are Frank P. Page, R. W. Hendershot and James E. Hauronic.

THE MASTER PHONE-DISC CORP., New York City, has been incorporated with a capital of \$51,000 to manufacture composition rubber specialties, etc. The incorporators are M. Wiener and W. H. Deuel. S. G. Nissenson, 32 Liberty St., represents the company.

THE BRACKETT-MASON-DODGE CO., INC., Peabody, Mass., has been incorporated with a capital of \$50,000 to manufacture cements, finishes and kindred materials for leather tanning. Charles P. Brackett is president and George H. Mason, Saugus, Mass., treasurer.

Industrial Notes

THE THADDEUS DAVIDS INK CO., New York, announces the election of Harold Merckle as president, M. A. Kline as vice-president and treasurer, F. E. Ashley as secretary and T. H. Pancoast as assistant secretary.

B. F. WITBECK has been elected president and treasurer of the Albany Chemical Co., New York. Dr. Michaelis, one of the founders of the company, has been elected chairman of the board of directors. The plant of this company is at Albany, N. Y.

THE QUIGLEY FURNACE SPECIALTIES CO., New York City, announces that W. H. Gaylord, Jr., formerly president of the Gaylord International Engineering Construction Co. and later sales manager of the McPhee Cement Co., has joined the company as assistant traveling sales manager in charge of the establishment of agencies for Quigley products. He will make his headquarters in New York.

THE M. J. DOUGHERTY CO., piping fabricator and contractor of Philadelphia, announces a change of address of its Atlanta, Ga., representative's office to Candler Annex. This office is in charge of Messrs. McKee and Wright. Their territory takes in the states of Florida, Georgia, Alabama, Tennessee, North Carolina and South Carolina.

THE JEFFREY MANUFACTURING CO., Columbus, O., has placed Harold B. Wood in charge of the New York office, which is now located in the Hudson Terminal Bldg., 30 Church St.

C. H. WHEELER MANUFACTURING CO., Philadelphia, announces the opening, June 1, of a branch office in Boston at 53 State St.

THE ESSENKAY PRODUCTS CO., Chicago, manufacturer of art gum, tire filler and allied products, has leased 28,000 sq.ft. of additional floor space at 2601-9 Cottage Grove Ave. Extensive improvements are to be made to transform the building into general office headquarters, salesrooms and factory.

THE AMERICAN ANILINE PRODUCTS, INC., New York City, announces that at the last meeting of the board of directors E. E. Fischer, formerly president and treasurer of the Kalle Color & Chemical Co., Inc., New York, was elected a vice-president and director.

A PERMANENT CONFECTIONERY AND ALLIED INDUSTRIES EXPOSITION will be opened in the new Wrigley Bldg., Chicago June 1. Chicago is the recognized center of this industry.

THE ABBE ENGINEERING CO., New York City, has added to its staff H. H. Wilson, an engineer formerly connected with the Westinghouse Electric & Mfg. Co. Mr. Wilson has also been chief engineer of the Colorado Electric Power Co. and superintendent of the Ontario Power Co. and its subsidiaries and has had considerable experience with machinery in chemical and electrochemical plants.

LESLIE H. ALLEN, who has recently been with Fred T. Ley & Co., contractors, of Springfield, Mass., first as an industrial housing engineer and then as sales manager for the New England territory, has joined the staff of the Portland Cement Association, Chicago, as assistant manager of the Cement Products Bureau.

GEORGE C. DEAN, CLAIR W. FAIRBANK, IRVING M. OBRIEGHT and MORRIS HIRSCH announce the removal of their office to the Park Row Bldg., New York City, where they will continue the practice of patent, trade mark and corporation law under the name of Dean, Fairbank, Obrieght and Hirsch.

THE ALBERHILL COAL & CLAY CO., 608 Pacific Electric Bldg., Los Angeles, Cal., has established a research laboratory in Los Angeles, which is open to all manufacturers of clay products for experimental work. The company is carrying on a campaign for bringing to Los Angeles new industries which will be users of clay products.

THE WHITE MOUNTAIN CHEMICAL CO. has recently been organized for the manufacture of chemical compounds. H. J. St. Yves is president, I. J. Nobert vice-president, A. E. Provost treasurer and E. H. Archambault assistant-treasurer. The company is located at 1061 Elm St., Manchester, N. H.

WILSON H. LOW and JOHN H. SHOW have purchased the plant built by the California Chemical Products Co., about nine miles south of Lone Pine, Cal., near the north end of Owens Lake. They intend to recover alkali salts from the waters of Owens Lake, and will manufacture soda ash and caustic soda. They may also recover sodium sulphate and some potassium salts. Messrs. Low and Show were formerly chief chemist and assistant chemist respectively for the Cudahy Packing Co., Omaha, Neb. Later Mr. Show was identified with the first and most successful of the companies producing potash from the lakes in western Nebraska.

THE ROSS HEATER & MFG. CO., INC., announces the opening of a branch office at 2 Rector St., New York City, which will be in charge of C. M. Hardin, who was formerly located in the home office in Buffalo, N. Y.

THE ENGINEERING BUSINESS EXCHANGE announces that John J. Swan has become associated with it. Mr. Swan was formerly with the Prest-O-Lite Co.

THE POWER SPECIALTY CO., manufacturer of Foster superheaters, economizers and oil stills, has opened the following additional offices: 512 Reliance Bldg., Kansas City, Mo., and 627 Linz Bldg., Dallas, Tex. The Kansas City office is in charge of William F. Meyer, who has been with the company for many years, and the Dallas office is in charge of M. W. Brown.

The Chicago office of the UEHLENG INSTRUMENT CO., of New York, was moved May 1 to the Great Northern Bldg., 20 West Jackson Blvd. Walter C. Lane has been appointed manager of this office.

THE INTERNATIONAL NICKEL CO. announces the removal of its offices to 67 Wall St., New York City.

THE NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES has moved its office from 480 Lexington Ave. to 342 Madison Ave., Canadian Pacific Bldg., New York City.

THE HAUCK MFG. CO., Brooklyn, N. Y., has elected as its president Henry T. Gerdes, mechanical engineer and manufacturer, of New York; first vice-president, M. C. Hauck; second vice-president, A. B. Hauck; third vice-president, H. H. Kress; treasurer, A. H. Stein, and secretary, J. Lutz. Mr. Gerdes, who succeeds the late Arthur E. Hauck, is a graduate of Stevens Institute of Technology and was for many years manager of the Treadwell Engineering Co. of Easton, Pa.

MANNING, MAXWELL & MOORE, INC., New York City, announces the election of J. M. David as president to succeed the late A. J. Babcock. Mr. David was formerly vice-president of the Baltimore & Ohio R.R. and general manager of its New York and Staten Island rail lines and terminals.

F. J. RYAN & CO., Philadelphia, Pa., announce they have just completed the installation of a large electric processing and solvent recovery equipment for the Termoid Rubber Co., Trenton, N. J., and an electrically heated belting table for the Victor Belata & Textile Belting Co., Easton, Pa. The Mires fuel-burning department, which has recently been added to the organization, announces the following installations: 1 large annealing oven, Mare Island Navy Yard, Cal.; 1 double chamber forging furnace, Naval Airship Construction, Lakehurst, N. J.; 5 pit annealing furnaces, 1 non-ferrous annealing furnace and 2 drying

ovens, Bridgeport Screw Co., Bridgeport, Conn.

THE STEEL FABRICATING CO. announces the completion of its new works and general offices at Michigan City, Ind., and the removal to that city from Harvey, Ill., of its executive headquarters.

New Publications

BOOKS

PRINCIPLES OF PHYSICAL CHEMISTRY. Second edition. By Edward W. Washburn, professor of ceramic chemistry in the University of Illinois. Pp. 516; 83 illustrations. New York: McGraw-Hill Book Co., Inc., 1921. Price, \$4.

In this new edition the general plan and arrangement of subject matter adopted in the first edition have been retained and the revision has consisted chiefly in the incorporation of new material representing the scientific advances which have been made during the past six years. Apart from minor changes, the topics included in the new material may be summarized thus:

In Chap. I on the structure of matter, the determination of the mass of an atom by the positive-ray spectograph of Aston; in Chap. III on the liquid state of aggregation, deductions from Poiseuille's law on the flow of fluids through capillary tubes and on plastic flow; in Chap. V on the crystalline state of aggregation, the Hull method for X-ray crystal analyses, illustrations of the crystal lattice of some simple substances, atomic diameters in the crystal lattice; in Chap. VI on crystal-gas systems, the kinetics of sublimation and condensation at crystal surfaces, rates of condensation and sublimation; in Chap. X on some principles relating to energy, a brief discussion of entropy, the quantum theory, the third law of thermodynamics and the Nernst heat theorem; in Chap. XIII on the thermodynamic environment of ideal solutions, the nature of the forces which determine thermodynamic environment; in Chap. XVII on conductance and the degree of dissociation, an amplified treatment of the viscosity correction; in Chap. XX on the heat capacity and internal energy of material systems, the Jeffries-Norton apparatus for the liquefaction of gases; in Chap. XXI on chemical kinetics, contact catalysis; in Chap. XXIV on the phase rule, the system SiO_2 , general temperature-composition diagram for two-component systems, three-component systems, solid models; in Chap. XXV on disperse systems, adsorption equilibrium; in Chap. XXVII on atomic structure and the periodic system, a detailed, illustrated exposition of the Lewis-Langmuir theory. To the miscellaneous problems in the appendix has been added a set of problems illustrating the application of physicochemical principles to the Lane and Lane-Bergius processes for the manufacture of hydrogen.

CONDENSED DESCRIPTION OF THE MANUFACTURE OF BEET SUGAR. By Franz Murke, Ph.D. Pp. 175. New York: John Wiley & Sons, Inc., 1921. Price, \$2.50.

In this book the steps in the process of preparing sugar from beets are treated in a concise, yet clear, form. Chemical, engineering and economic problems are all taken into consideration and the presentation is thoroughly practical. Thus in the chapter on evaporation the method of calculating the heating surfaces for any type of vapor distribution is given in detail. The chapters in order are: Harvesting; storing and receiving beets; fluming, washing and weighing beets; cutting beets; diffusion process; pulp; diffusion juice; first carbonation; filter presses; after-purification; evaporation; thick juice saturation and filtration; first fillmass and remelt sugars; further operations with the first fillmass; after-product operations; lime kiln; Steffens separation; osmose process; boiler house; miscellation; tables for calculations.

RUBBER, RESINS, PAINTS AND VARNISHES. By R. S. Morrell, M.A., Ph.D., F.I.C., and A. de Waele, A.I.C. Pp. 236; 33 Figs. New York: D. Van Nostrand Co., 1920. Price, \$4.

This volume of Dr. Rideal's series on industrial chemistry covers a number of important and interesting industries. The book is divided into five parts: part I is devoted to the rubber industry, rubber substitutes and synthetic rubber; part II to the drying oils, including the action of driers; part III to resins and pitches; part IV is divided into two sections, (1) pigments and paints, (2) linoleum, floorcloth and cork carpet; part V, on varnishes, has sections on the oil, insulating, spirit, and cellulose ester types of varnishes and on the methods of analysis. Bibliographies and an index complete the volume.

ORGANIC MEDICAL COMPOUNDS. By M. Barrowcliff, M.B.E., F.I.C., and Francis H. Carr, C.B.E., F.I.C. Pp. 331; 24 Figs. New York: D. Van Nostrand, 1920. Price, \$4.

In preparing this volume for Dr. Rideal's series on industrial chemistry, the authors have endeavored to treat the preparation of organic medicinal compounds on an industrial scale. Thus the method given for the manufacture of ether is that in use at H. M. factories Pembrey and Gretna. The compounds are grouped as follows: Narcotics and general anesthetics; naturally occurring alkaloids and their derivatives; natural and synthetic local anesthetics; antipyretics and analgesics; organic antiseptics and disinfectants; purgatives; vasoconstrictors and vaso-dilators; diuretics and uric acid solvents; organo-metallic compounds; the digitalis group; skin irritants, glucosides and neutral principles.

URANIUM IN STEEL. Pp. 32; 20 Figs. Pittsburgh, Pa.: Standard Alloys Co.

This little book, attractively bound and printed, gives a brief account of the history of uranium, its chemical determination in ores and steels, and its properties as an alloying element. Physical test charts and records of isolated tests are given to show that steels containing but a small percentage of uranium have an unusually high merit number on account of a very material ductility in hardness specimens after a low draw.

PAMPHLETS AND CLIPPINGS IN A BUSINESS LIBRARY. By Virginia Fairfax. Pp. 62. San Francisco: Journal of Electricity and Western Industry.

Coming Meetings and Events

AMERICAN CHEMICAL SOCIETY will hold a meeting at Rumford Hall, Chemists' Club, New York City, on June 10.

AMERICAN CHEMICAL SOCIETY, THE SOCIETY OF CHEMICAL INDUSTRY and the American Section of the latter society will hold a joint meeting in New York, Sept. 6 to 10.

AMERICAN ELECTROCHEMICAL SOCIETY will hold its fall meeting in Lake Placid, N. Y., Sept. 29 and 30, and Oct. 1.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS will hold its spring meeting June 20 to 24 at Detroit. Industrial excursions will be made to Ann Arbor, Saginaw, Midland and Bay City.

AMERICAN LEATHER CHEMISTS ASSOCIATION will hold its eighteenth annual meeting at the Hotel Ambassador, Atlantic City, June 9, 10 and 11.

AMERICAN MINING CONGRESS AND NATIONAL EXPOSITION OF MINES AND MINING EQUIPMENT will hold its twenty-fourth annual convention in the Coliseum, Chicago, Oct. 17 to 22.

AMERICAN SOCIETY FOR STEEL TREATING will hold its third annual convention and exhibition Sept. 19 to 24 at Indianapolis.

AMERICAN SOCIETY FOR TESTING MATERIALS will hold its 1921 annual meeting in the New Monterey Hotel, Asbury Park, N. J., during the week of June 20. Technical sessions are scheduled as follows: Tuesday, on Preservative Coatings and Textiles; Wednesday, on Cement, Concrete and Road Materials; Thursday, on Ceramics, Lime and Gypsum, on Petroleum Products and on Testing Methods; Friday, on Metals.

THE NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (SEVENTH) will be held during the week of Sept. 12 in the Eighth Coast Artillery Armory, New York City.

NATIONAL FERTILIZER ASSOCIATION will hold its twenty-eighth annual convention at the Greenbrier Hotel, White Sulphur Springs, W. Va., the week beginning June 20.

NATIONAL LIME ASSOCIATION will hold its annual convention in New York City June 15 to 17.

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stettens Restaurant, 842 Broad St., Newark, N. J., the second Monday of every month.

SOCIETY OF CHEMICAL INDUSTRY (BRITISH) at the invitation of the Montreal section will hold its annual meeting in Montreal and other Canadian cities during the week of Aug. 29, 1921. Details will be printed in this magazine from time to time.

STAMFORD CHEMICAL SOCIETY, Stamford, Conn., holds a meeting in the lecture room of the local high school on the fourth Monday of each month, except June, July, August and September.

Number 23

Mineral Tariffs And Raw Materials

THE tariff on minerals involves certain economic and political problems not always considered in the usual protection vs. revenue controversy. What, for example, should be our attitude toward the continual exploitation of basic materials, the deposits of which are already rapidly approaching depletion? What should be our responsibility to American capital invested in foreign mineral supplies, and should we discourage these investments by surrounding our domestic industries with insurmountable tariff walls? Is the doctrine of free trade in raw materials applicable to our mineral industries?

Elsewhere in this issue is presented an unusual discussion of these important questions and the relation they bear to the proposed mineral tariffs. The article, representing only the author's opinions on this subject, is not to be construed as an expression of the editorial policy of this journal, but we believe that it offers a viewpoint of interest to all who are concerned with our mineral developments. To be sure, the detailed classification of some of the minerals may be questioned and many of the proposed tariffs do not warrant serious consideration. It is evident, too, that most of the rates have purposely been set at comfortably high levels in anticipation of later compromise and reduction. The general principles involved, however, apply no matter what rates are to be fixed by the new tariff law, and it is to this broader phase of the subject that CHEMICAL & METALLURGICAL ENGINEERING invites the comment and criticism of its readers.

A tariff on those minerals which because of geological limitations cannot be produced in sufficient quantities to supply the domestic requirements must necessarily raise the selling price of these products. As the producer's margin of profit is broadened, he will attempt to increase his output and will thus hasten the depletion of our limited domestic resources. This must be regarded as an extremely shortsighted policy, especially in the case of minerals of essential war- or peace-time uses. It would be more advisable, perhaps, for the Government to purchase and hold in stock sufficient supplies of these ores to carry us through another emergency.

With reference to the question of American capital invested in foreign mines, it is somewhat surprising to learn that these investments amount to almost a billion dollars and are continually increasing. Many of the proposed mineral tariffs will seriously affect the future return on these investments; in such cases the capital must be withdrawn or the mines operated solely for foreign consumers.

The third question raised by the author is the relation of our mineral supplies to the general and broader

consideration of raw materials. One of the lessons taught us by the late war was the serious economic effect of artificial barriers erected in the path of the free interchange of basic materials. The unrestricted ingress and egress of such articles would place the industries of all countries on a parity with regard to fundamental supplies and leave them dependent for their success as fabricators solely on their own skill and ingenuity. The free and unhindered development of the natural resources of the world represents a goal which can be attained only through the adoption of the broadest principles of national and international service.

Season-Cracking and Intergranular Fracture

COOKS and metallurgists have little in common. The better the cook's work the quicker it vanishes, but metallurgists build to endure—when they put a piece of metal into service it is expected to stay. Spontaneous fractures, occurring under moderate or even no load, are therefore matters of much concern; one cracked condenser tube is of more moment than thousands of sound ones.

Metals widely used in structures, utensils and machines all possess ductility to a certain degree; they deform appreciably before breaking. It has been shown that such normal or healthy fractures almost exclusively pass along crystal planes rather than between the grains which make up the metal. On the other hand, spontaneous fracture of drawn or spun brass goods while in storage, like cartridge cases, cups, jars, or tubes, has in all cases been found to be essentially intergranular. Fire-cracking, the damage done during annealing stamped utensils, is another manifestation of intergranular rupture.

Mysterious failures in other alloys have been studied in the past two or three years, and in nearly every case the crystals have given way at their borders; it therefore appears that season-cracking is a special case of a more general disease. To cite several instances, boiler plates have been found badly cracked at locations of somewhat concentrated forces after long service at the temperatures of superheated steam. Mild steel under low stress can be quickly fractured by immersing in hot chloride solutions. Corrosion, without any accompanying tensile stress, seemed to be responsible for the failure of an iron stirring rod used in a fused niter bath. Ductile metals break at crystal boundaries if tested at temperatures near the melting point. Pure copper develops intercrystalline cracks in a salt bath, and lead crumbles in the same way if exposed to certain weak acids. Furthermore, as is well known, fractures apparently the same as season cracks can be developed in brass articles by immersion in mercury solutions or exposure to ammonia gas.

Now, if these are all manifestations of the same group of phenomena, it is important to discover what is common to all; then see if that common cause is also a sufficient cause. That known, it can perhaps be avoided.

Tension stresses, either internal or imposed, are conceded to be the companion of all intergranular rupture. But why should a piece withstand the load for days or even years, and then give way? Why should a fracture imposed in ten minutes be transcrystalline, another in the same metal but in ten years be intergranular? ROSENHAIN says it is due to the fact that the amorphous intercrystalline cement is a highly viscous liquid, which, like pitch, deforms slowly even at low temperatures and under low loads, if these are prolonged a sufficient time; movement is more rapid as the temperature increases. Consequently fractures under prolonged stress will always be intergranular.

Pushed to its limit this theory would call for ultimate breakdown in all metal, no matter how small the load. Such a conclusion violates common experience and history. Consequently certain counteracting factors must exist.

The one most favored by Dr. ROSENHAIN is the interlocking of crystalline grains—if this condition exists, a small yield in the amorphous cement merely throws the load on crystal projections which can endure it forever. He believes that intercrystalline failure requires polyhedral grains bounded by quite smooth surfaces, a common condition in recrystallized metal. His recommendation is, therefore, to relieve internal stresses by a gentle anneal, but see to it that interlocked crystalline microstructure is retained. By all means avoid prolonged, high-temperature anneals.

But many annealed pieces must endure imposed tension stresses. Will they eventually rupture? It is doubtful. A second factor preventing this unhappy event is the probability that highly viscous supercooled liquids such as intergranular cement act in a truly elastic manner under moderate loads. Granted that a definite yield infers ultimate rupture in unsupported amorphous material, there is evidence that the time required to cause yield becomes infinite before the related stress approaches zero. Ten thousand pounds per sq.in. tension will not produce corrosion cracking within a measurable time in recrystallized brass having smooth grain boundaries. Even though some stress is necessary to produce season-cracking, it seems reasonable to suppose that the metal will endure at lesser stresses. In other words, no metal will break at any temperature unless loaded beyond the elastic limit of the amorphous phase at that temperature, regardless of its age, its composition or lack of crystalline interlacing.

But in many cases, if not in most, corrosion or chemical action at the crystal boundaries is the determining factor. Rarely surface corrosion or a scratch will disorganize the equilibrium of forces, building up localized and unsafe stresses, but this is only in rare cases. Reagents which cause true intergranular failure have been shown by MOORE in England and RAWDON in America to have a very superficial action—not penetrating the crystalline material, confined entirely to its grain boundaries, harmless unless external or internal tension stresses open up the cracks at the affected surfaces, providing the way for further entrance. On this basis time is evidently a controlling factor. A rough crystal surface also obstructs its progress.

But, as argued previously in these columns, there must be some essential difference between intercrystal-

line amorphous material and the amorphous material formed at gliding planes in overstrained grains. That lies either in the fact that the first is a very thick layer, while the latter is only a very few atoms thick, or that the disorganized metal at slip bands is precisely like that of its bordering crystal blocks, as far as chemical composition is concerned, whereas the non-oriented material at grain boundaries is the natural location of slightly soluble impurities. Such segregation may reach high concentrations even in normal practice, but especially in second-rate or over-annealed metal, and are certainly influential in causing the selective action of corroding substances.

It appears that chemical heterogeneity at grain boundaries has not heretofore been given the consideration its importance deserves. It accounts for failures by selective corrosion, which in turn requires time and tension. It is sure to be increased by long annealing even if no new impurities are added, by burning or overheating, since the existing ones will become more concentrated. It decreases the "melting point" of the amorphous phase, and consequently lowers its viscosity at all temperatures.

It may be argued that such chemical segregation is not a determining factor in intercrystalline failure, since it is a perfectly normal attribute of all metal. The same is true of stress. Quality metal, however, must be free of one or the other in order to withstand minute amounts of reagents so common as ammonia and salt. Since the reason for metal's existence is to do work or support loads, it follows that safety can be attained only by carefully controlling the microstructure and microchemistry of the crystal boundaries.

Dryness of The Liquid Phase

THE *Ironmonger*, an English trade paper, notes with regret in its issue of April 30 the disappearance of the corkscrew from British exports to the United States. The phenomenon is declared to be a sequel of prohibition. Little does the editor know his America! Laws are said to follow customs and public opinion, but customs in language and even processes of thought sometimes follow laws. Thus in the olden days a dry liquid such as wine was held to contain a minimum of sugar. The expression did not indicate that the wine was sour, but rather the absence of sweetness. Now, under the enlightenment of prohibition dry indicates the absence of a fermentation product of sugar and not of sweetness itself. Vast quantities of sugar are employed in the manufacture of beverages without affecting the meaning of dry. Out of prohibition also has grown the rule of physical chemistry in regard to dryness of the liquid phase, viz.: The dryness of a liquor varies inversely as to its C_2H_5OH content and directly as the mass.

Now, since all potable liquors are by law between 99.5 and 100 per cent dry the quantities consumed become very great and so do the number of stoppered bottles that contain them. The demand for corkscrews would therefore become greater than before were it not for the crown stopper and another reason which the editor of the *Ironmonger* misses utterly. This is the powerful thirst which has developed among Americans. It is held that a good American of the 100 per cent variety can easily draw the cork from a bottle of high-proof spirits by merely kissing it.

Can Opportunity Be Capitalized?

IN RECENT conversation with a thoughtful scientist he drew our attention to a present tendency on the part of some labor organizations to claim the right to work as their property. In this attitude they do not claim to represent all the people, but they are unwilling to submit their contentions to all the voters. They are a minority, but in some cases they propose to force their views on an unwilling public.

The point at issue and which must not only be decided but made clear one of these days is whether opportunity is property or not. We have prided ourselves in this country that every man has his opportunity free. It is a partial truth, like the lawyer's claim for equity in a day at court. But more men have had opportunity in this country, we think, than elsewhere. It is and always has been our ambition to make opportunity as nearly free as it can be made. The point at issue is how far opportunity may be capitalized and held to the exclusion of outsiders. We have property rights in houses, in bank accounts, in business, in good will, but we have held that every man is free to work.

The rule is not universal. In China they have property rights in houses, land, etc., just as we have, but also such rights in work. The coolie, for instance, is an outsider. He has no property rights in his labor, but he buys the privilege from the man that owns it, that has the concession. This same ownership is claimed by the officials of many labor unions. The tendency under unionism is to insist that work be farmed out to the unions just as the collection of taxes used to be farmed out. The unions select their members, decide what is fair or unfair, and use the power of siege to enforce their decisions.

Now, we favor the organization of workers for their welfare and protection. The selfishness of many employers has made that necessary. But does such organization provide ownership in the privilege to work? Let's take a stupid job like carrying a hod that requires neither training nor intelligence beyond a twelve-year-old mind. Is the opportunity to do this thing restricted to men who belong to the union? Many claim that it is; that the union is sole owner of the opportunity to work at the so-called craft, and that only its members may be employed. But *does* the union *own* the access to work that its members perform? It may and does hold possession, but is it the union's property?

Without of necessity thinking so (and we admit we do not think so), let's grant for the sake of argument that it is. Then the closed shop follows as a natural conclusion. The work is done under centralized, outside control which does not own the business or the machinery. The man who has work to be done and the man who wants to work for him cannot come together without authority which rests apart from them both, in the officials of a union.

There are more things to be done in nearly every country in the world than there are persons to do them. But if the opportunity to work is not reasonably free, then the work cannot be done. If opportunity is property, invention of labor-saving machinery must be brought to a stop as soon as general unionization ensues.

But if opportunity is not property; if the outsider, no matter who he is, has access to opportunity, there would seem to be a lack of equity in the closed shop. In the open shop the union must prove itself and do well. In the closed shop it is an absentee landlord.

Common Honesty And Self-Interest

ONE of the notable features of the present economic situation is the fact that some commodity prices are very much higher than others, judged either by their pre-war standards or by the production costs involved. In his very able discussion of the business and economic situation before the recent meeting of the American Iron and Steel Institute Judge GARY intimated that some sellers who are still holding their commodities at very high prices "ignore the principles of common honesty." Many may hold that it is taking new or advanced ground to declare that it is not honest for the ordinary seller to seek the highest price he can obtain or ask any price he has a mind to ask. Judge GARY is the head of a large corporation, and it is commonly held that a corporation large in its field should not charge an unreasonable price. Why should it be right for a seller small in his field to do so, when circumstances unprecedented have made it possible? Society always decides that what is not good for itself is wrong, and the great majority of men today believe that the continuance of high prices for some commodities, when prices of other commodities have greatly declined, is retarding the resumption of business activity, which would be for the general good.

Entirely apart, however, from "the principles of common honesty" is the question of enlightened self-interest. Is it wise, from the purely selfish viewpoint, for a seller to maintain high and unreasonable prices, simply by the fortuitous circumstance that all sellers of the commodity chance to be of the same mind and competition does not reduce prices? General business activity will not be resumed before all prices are adjusted, and if the completion of the adjustment is expedited all will benefit.

The common view seems to be that business will become active when the readjustment is completed—in commodity prices, in wage rates and in charges for service. It is by no means certain that resumption on the full scale will occur at once. Two things are required—the investment of capital and the spending of a large percentage of the normal or full income of the people. When there is much idleness, as at present, that income is greatly reduced. The normal buying power of the people must be restored, and that is a process requiring time and it is the duty of everyone to do what he can to help.

It has always been recognized that for the good of society all prices should be fair and reasonable, whether for commodities, for service or for plain work. Prices too low are as bad as are prices too high. Hitherto we have depended chiefly upon competition as the regulator, as is seen, for instance, by our being very jealous of suppression or partial suppression of competition by the acts of men; and more than thirty years ago Congress enacted a law fixing penalties and establishing methods of procedure in cases of "conspiracy in restraint of trade." In essence the Sherman law did not make such conspiracies illegal, as it was recognized that they were contrary to the common law; it prescribed what should be done. Present experience indicates that reliance upon competition as a corrective has broken down and society needs something more for its protection and welfare. Hence arise references to "the principles of common honesty" and the hope that enlightened self-interest will have a controlling influence where competition fails to operate.

Readers' Views and Comments

Easy Money From Peat

To the Editor of Chemical & Metallurgical Engineering

SIR:—A few days ago I learned from a friend of mine that a friend of his and several other gentlemen were investigating and seriously considering investing in a world-revolutionizing process which is none other than the one you exposed in the article "Easy Money From Peat" in *CHEM. & MET.*, Feb. 2, 1921, page 213.

I told him of your article, which he subsequently brought to the attention of his friend, with the result that the prospective investors will save their money for other purposes. I would have been glad to see a demonstration of the process, but when the investors asked for a demonstration they were told that none could be made now, as the amount of stock at present offered for sale had already been subscribed. The promoter evidently surmised that the would-be investors had discovered his game and he found it expedient to look elsewhere for lambs to be shorn. I thought it would interest you to know that the process is still very much alive.

Newark, N. J.

CHEMIST.

A Suggestion for the National Research Council

To the Editor of Chemical & Metallurgical Engineering

SIR:—The National Research Council, like every other organization at the time of its creation, to become a functioning body has to grope around and possibly crowd itself into some niche partly or wholly occupied by some other organization already in existence. Without doubt in the effort to find some one duty the National Research Council can perform better than any other existing organization a number of experiments will be tried which will wholly or partly fail.

At the present time the council is vaguely offering aid to American scientists—and I am writing this from the organic chemist's standpoint—in their research problems. I believe that this endeavor will have little success for several reasons. First, no scientist will disclose his plans sufficiently for the council to get an adequate idea what he is trying to do and its advice can be very general only. Directions in research work should be more specific than the directors of the Research Council will be able to give. Second, the organic chemist in the smaller schools doesn't usually suffer from lack of material and apparatus, but from lack of access to literature; therefore he will not take advantage of the offer to lend apparatus. Books to be useful must be readily accessible. If one is to consult a reference it is important that it can be done promptly. One can anticipate very few of his needs in literature references. For this reason I do not believe the experimenter in the smaller school can make use of the offer of aid in research.

One who has taught in a small school, which is often located in a small town, knows that the greatest need of the teachers is the stimulus obtained from meeting and hearing our able chemists. Sending them around the country makes them accessible to a few of us, but we aren't asking for charity so much as we are asking for

an opportunity. Would it not be feasible and worth while to conduct a series of meetings resembling the present teachers' institutes, to be held in a number of centers where we could spend a week or ten days during vacation periods and hear and meet a number of our prominent chemists? In addition to hearing these men we would have the chance to exchange ideas with men who are interested in the same work and the result would be an increased interest and efficiency and an increased amount of research work.

These institutes could be conducted in a business-like way with a charge which would cover or at least partly cover the cost of the undertaking. I am interested in learning what others think of such a plan.

Miami University,
Oxford, Ohio.

HARVEY C. BRILL.

Cost of Fixed Nitrogen

To the Editor of Chemical & Metallurgical Engineering

SIR:—In your issue of April 20 K. W. Jensen makes some comment on my article concerning cost of nitrogen fixation in the issue of March 23. Mr. Jensen states that his knowledge of the question is derived from a visit to Rjukan, Norway, and from theoretical studies. As I have been connected for twelve years with the Norsk Hydro-Elektrisk Kvælstofaktieselskab, which operates the factories at Rjukan and Notodden, and during this time have conducted the work of projecting and fitting up the firm's most modern plant, Rjukan Fabrik anlæg II (100,000 kw.), Mr. Jensen's experience does not impress me very much.

In explaining the Birkeland-Eyde furnace Mr. Jensen has the ill luck to make an erroneous statement. The disk of flame is *not* due to the action of *two* magnets, alternately charged and discharged, but to the action of *one* magnet, charged with *continuous* current, one pole at each side of the furnace. The extension of the disk at both sides of the electrodes is due to the fact that the *electrodes* are charged with alternating current. It ought not to be necessary for Mr. Jensen to travel to Norway to gain this knowledge, as he might have learned it from the technical literature. (Cf. Geoffrey Martin, "Industrial Nitrogen Compounds and Explosives," 1917, page 23; Jean Escard, "Production Industrielle Synthétique des Composés Nitrés," 1920, page 40; H. Ost, "Lehrbuch der Chemischen Technologie," 1920, page 168.)

Mr. Jensen writes that I ought to have made a lengthy explanation of the Birkeland-Eyde furnaces. In giving a short statement of the steps in the process the intention was to give information to readers who knew little of the subject, or, like Mr. Jensen, had formed mistaken notions. Is Mr. Jensen aware of the fact that at Rjukan Schönherr furnaces are used besides the Birkeland-Eyde furnaces?

I must maintain that in all types of electrical furnaces for the fixation of atmospheric nitrogen the electrical arc is given an increased area in order to heat the air by forming an enlarged heating surface. I presume that after all Mr. Jensen and I are of one mind about this point.

Christiania, Norway.

T. C. HAGEMANN.

British Chemical Industries

FROM OUR LONDON CORRESPONDENT

LONDON, May 17, 1921.

BUSINESS in the chemical markets is still mainly of the hand-to-mouth variety and the increasing number of works that have closed down on account of the coal shortage has naturally had a cumulative effect in reducing the volume of business transacted. The undertone both prior to the stoppage and even now is, however, favorable, surplus stocks are dwindling, and it is expected that, taking into account the practical cessation of German imports, there should be a healthy revival two or three months hence. The financial resolutions for the protection of industries bill have been duly passed by Parliament, but it is too early to predict the effect of the actual measure when it comes up for consideration after the holidays. The reparations bill, under which 50 per cent of the value of German goods imported is to be recovered, has so far produced only \$25,000, a figure which is a true measure of its failure to date. It is understood that the amount payable will now be reduced to 26 per cent on account of Germany's acceptance of the Allied ultimatum.

MANY PLANTS CONVERTING TO OIL FUEL ON ACCOUNT OF COAL SHORTAGE

The big oil-producing companies have been quick to seize the opportunity afforded them by the cutting off of supplies of coal and so far labor has not attempted to place an embargo upon the importation of fuel oil as in the case of foreign coal. By a suitable reduction in the price, oil fuel has for the time being become a serious competitor of coal, particularly in power plants and works situated some distance away from the main colliery centers. The ease and cheapness with which conversion can be effected has induced others to install oil-burning appliances as a stand-by for existing coal-fired installations and the natural result has been a boom in oil burners new and old, good, bad and indifferent. It is a little difficult for a great oil-burning nation like the United States to realize that the use of fuel oil in this country is practically in its infancy, but provided the present reduced price can be maintained, there can be no doubt of a steady increase in demand, which in its turn would react upon the price and also upon the supplies available in the future for American consumption.

"CHALKOAL"—A JOKE OR AN ATTEMPT TO GULL THE PUBLIC?

A further sign of the difficult industrial and domestic position occasioned by the coal stoppage is the crop of coal substitutes such as peat, logs, sawdust and briquets of all kinds which are being advertised for sale. A good illustration of the potential gullibility of the public and perhaps also of the promoters of the enterprise is the amusing advertisement and propaganda of the Chalk Fuel, Power Gas and By-Products Corporation, Ltd. This company proposes to supply blocks or ovoids of "Chalkoal," a mysterious "patented" substance manufactured under a secret process and stated to contain 70 per cent of chalk mixed with "10 per cent of a rich carbon substance subjected to special treatment" and the basis of which is coal tar. The preliminary announcement states that it is "a scientific fact that chalk by itself is not a satisfactory fuel [*sic*], but in

conjunction with other substances it has more fuel properties." A user is quoted as follows: "I find that in burning the briquet the gas which the chalk contains readily combines with the carbonaceous matter, and therefore gives you a combustible gas, giving off great heat, and double that of the ordinary household coal at from one-half to three-quarters less cost." The tragedy of it all is, of course, that the residue amounting to between 10 per cent and 33 per cent is a valuable byproduct threatening the cement and lime industries with extinction. Why the promoters should have kept the matter secret since 1914, when it was first "tested," is not disclosed.

CHEMICAL STONEWARE FIRMS RETURN TO PRE-WAR APATHY

During the war several manufacturers of stoneware undertook, at the request of the government, the production of chemical stoneware, and while the need remained urgent, valuable work was done and chemical stoneware almost equal to the pre-war German material was obtainable. The enormous demand shortly after the armistice for stoneware other than chemical stoneware caused most of these firms to abandon the less profitable manufacture of chemical ware, and as a result it is almost impossible to obtain reasonable deliveries, or any deliveries, at the present time, while with one or two exceptions manufacturers are asking exorbitant prices, probably with a view of discouraging the continuance of this class of business as being too much trouble. Supplies of German stoneware came into the market only to stop on account of the reparations act. The position has therefore become an interesting one and French, Belgian and even American stoneware is likely to be in demand in the near future. Curiously enough, an American firm, Bush, Beach & Gent, is acting as the British agent for the Deutsche Steinzeugwaarenfabrik, of Friedrichsfeld, but judging by its advertisements in the press, the technical knowledge of its staff leaves much to be desired. It is generally thought that a progressive American firm able and willing to purchase an existing works in this country would soon find a ready field of activity in the chemical stoneware market, particularly if standardization were carried out as far as possible.

SIR WILLIAM POPE DEFENDS CHEMICAL WARFARE

In a closely reasoned contribution to *Chemical Age* (London), the president of the Society of Chemical Industry has once again displayed a fearlessness and independence of thought which has left some of his more staid and more conservative colleagues somewhat aghast. Not only is it claimed that the use of gas is less inhuman than other accepted forms of warfare—and this is effectively and humorously demonstrated by historical and practical evidence—but in effect it is shown that the most fatal weapon in the war was that of preventive medicine. By enabling millions to wage war and by depriving the non-combatants of the world of their meed of medical protection the responsibility for another and very large class of casualties is laid at the door of the medical profession. Sir William Pope, by his candor and innovations in other directions—for instance, by welcoming criticism as indicating a healthy tone in any society, by promoting joint local meetings of the Chemical Society and of the Society of Chemical Industry—has done more good than is realized by the "Old Guard."

The Tariff on Minerals

A Novel View in Opposition to the Policy of Tariff Protection for Minerals, Based on the Present Status of Our Mineral Industries and on the Effect of a Tariff on Their Development

By MARC PAWL

THE Ways and Means Committee of the House of Representatives has an exceedingly difficult job in trying to fix just rates in the new tariff bill that is to be introduced during the present session of Congress, for no man can know the conditions surrounding all the multifarious industries of this country, and no man can visualize the ramifying effects of a tariff. The difficulties are increased by the testimony and the briefs brought before the committee, for they are almost invariably highly colored by the desires of financially interested pleaders. In some of the briefs not a single fact is given without distortion, though a very few give fair and even scholarly presentations of their cases from the pleaders' standpoints.

In most pleas, especially by monopolistic concerns, costs, which ought to be the very foundation on which a tariff is erected, are carefully concealed, or excessively high costs covering the less defensible part of the industry are given, and the public is asked to grant a tariff to bolster prices, the justice of which is not shown.

In going over the reports of hearings before the Ways and Means Committee of the House, the unanimity of the emphasis placed on certain points is striking. Nearly all bills declare that they are "to provide revenue for the Government and for other purposes." One is to provide for the national security and defense, but I have seen one only that frankly states that it is merely to fix a duty on a mineral. One fears the Greeks who come bearing gifts.

Many of the pleas are for a tariff of 100 per cent or more of the price of the mineral or metal before the war, though some are less, and many have not yet reached the form of bills. Most of them ask for duties that will hold prices at or near the level reached during the Great War, but all show that the industry will not be overly enriched, and that the ultimate consumer will never know that his pocketbook has been touched.

Congress, in order that it might have less biased information than that introduced by special pleaders, provided for a Tariff Commission to investigate conditions governing the various industries, one of the most forward steps taken in tariff legislation in this country. This commission has done serious, hard work, but being composed of mortals, even as you and I, will require years to cover the huge and ever changing industrial world before it.

EFFECTS OF A MINERAL TARIFF

Perhaps no industry offers simpler conditions for weighing the application of a tariff than the mineral industry, and no industry except farming is more vital to our well-being.

General Hancock was, of course, wrong when he said that the tariff was a local issue. None but the immediate beneficiary has a local habitation. The payor is

every purchaser from Cape Prince of Wales to Key West, and the effect of a mineral tariff may be much more serious than the immediate effect it has in increasing the industry or raising prices.

Ore deposits are diminishing assets. They are like cisterns—they hold a fixed quantity, but unlike cisterns they cannot be filled again. The first production—that from the outcrop—is the cheapest, and as the deposits are worked to greater depth, or the richer ores are worked out, the costs become greater. The first deposits worked are usually the richest and nearest to transportation routes, and there is only one crop of ore.

On these truths, so axiomatic that they are almost trite, is built the mining industry, yet every appeal for a tariff is based on the assumption that these factors do not apply to the particular item under consideration. The plea is almost invariably made that if proper "protection" and "encouragement" are given, the industry will prosper, though the lack of prosperity may be due to lean deposits, inefficient operation and poor location, for ore deposits are where you find them and may be in very inconvenient places.

Never before has there been so good an opportunity for a proper estimation of the country's mineral resources as the present. During the Great War, the prices for minerals and metals reached heights unheard of. Prospecting took on new life, and men went over the country with a fine-toothed comb. Every possible outcrop was carefully examined and known deposits were worked to the limit. At the same time, governmental agencies gathered together all possible data thus made available.

OUR MINERAL RESOURCES AND PROPOSED TARIFFS

Although the United States is the richest mining country in the world, there are certain metals and minerals in which it is very poor, of which the principal are nitrates, the platinum metals, tin, nickel, soluble potash salts and diamonds. We have some of all of them, but by no possibility can we get enough for our needs from known deposits. If we think of our mineral resources as represented by a pyramid, these mineral products may be taken as forming the apex, thus approaching zero. If we imagine the lower part of the pyramid as curving so that at the bottom the sides become nearly horizontal, the base may be taken to represent our illimitable supplies of such minerals as salt.

Using such an idea, the minerals and metals on which duties are now being asked have been grouped in the accompanying table. The list is divided into two main groups: I. Minerals of limited quantity; II. Minerals in large quantity. Under the first group three divisions may be made: A. Minerals insufficient for domestic needs; B. Minerals insufficient for domestic needs ex-

MINERALS ON WHICH DUTIES ARE ASKED

	Proposed Tariff	Price in 1913
I. Minerals of limited known quantity:		
A. Minerals insufficient for domestic needs:		
1. Antimony ores.....	10c. per lb. contained Sb in ores, matte and antimonial lead.....	Best grade, 8.53c. per lb.
2. Cobalt oxide.....	75c. per lb.....	50c. or more per lb.
3. Tin ore.....	10c. per lb. Sn and 4c. on Sn in ore.	44.2c. per lb.
4. Graphite (lump and amorphous).....	Lump 3-6c., amorphous 2c. per lb..	Ceylon lump 6.5-11c. per lb.; amorphous 1-1½c. per lb.
5. Diamonds.....	10% (incl. borts).....	
6. Iodine (resublimed)...	33½% ad val.....	
7. Nickel.....	10c. per lb.....	38c. per lb.
B. Minerals insufficient for domestic needs, except at artificial prices:		
1. Aluminum (bauxite)...	Al 7c. per lb., bauxite, not determined	
2. Chromite.....	60c. per unit.....	50% Cr ₂ O ₃ , \$10.12 per long ton.
3. Manganese ores.....	40c. per unit.....	\$7-\$12 per ton.
4. Monazite.....	15c. per lb.....	None produced.
5. Tungsten ores.....	\$10 per unit (20 lb.) WO ₃	\$7.50 per unit WO ₃ .
6. Pyrite.....	10c. per unit S.....	8.4c. per unit S (Virginia).
7. Mercury.....	50c. per lb.....	52.7c. per lb.
8. Graphite (flake).....	6c. per lb.....	6-8c. per lb.
9. Mica.....	Unrefd. 25c. per lb. and 20% ad val.....	37c. per lb.
10. Potash.....	50c. per unit K ₂ O.....	66c. per unit.
11. Vanadium.....	\$1 per lb. (in ore?).....	
12. Magnesite.....	Crude \$15 per short ton. Calcined \$25 per short ton.....	Crude \$7. Austrian calcined \$16.20 per short ton.
C. Minerals sufficient for the immediate future:		
1. Arsenic (white).....	5c. per lb.....	4.4c. per lb.
2. Barite.....	\$15 per short ton.....	\$1.71 per short ton.
3. Bromine.....	7c. per lb. plus 30% ad val.....	20.1c. per lb.
4. Fluorspar.....	\$5 per long ton.....	\$6.37 per ton.
5. Fullers earth.....	75c. and \$1.50 per short ton.....	\$9.58 per short ton.
6. Lead ores.....	½c. per lb. Pb cont.....	4.4c. per lb.
7. Molybdenum ores.....	50c. per lb. on MoS ₂ and concentrates.	80% conc. 42½c. per lb. MoS ₂ cont.
8. Zinc ores.....	2c. per lb. Zn in ore.	5.6c. per lb.
9. Feldspar.....	Not determined.....	\$3.31 per ton.
10. Sulphur.....	0.75c. per lb.....	0.8c. per lb.
II. Minerals in large quantity:		
1. Lime.....	\$1 per bbl.....	75.3c. per bbl.
2. Building and monumental stone.....	\$1 per cu.ft.....	
3. China clay.....	\$6 per ton.....	\$6.76 per ton.
4. Gypsum.....	50c. per ton.....	\$1.51 per ton.
5. Magnesium chloride.....	\$15 per ton.....	Fused, \$8 per ton.
6. Magnesium.....	10c. per lb. plus 15% ad val.....	\$1.65 per lb.
7. Flint (quartzite is used as a substitute).....	Not determined.....	
8. Pumice.....	\$20 per ton.....	\$2.26 per ton.
9. Talc.....	\$10 per ton.....	\$11.90 per ton.
10. Salt.....	\$5 per ton and duty on container.....	\$2.72 per ton.
11. Coal.....	75c. per ton.....	\$1.33 per ton at mine.
12. Phosphorus.....	17c. per lb.....	

cept at artificial prices; C. Minerals sufficient for the immediate future. It is probable that few if any of the producers will agree with the grouping, but the divisions are as indicated by the statistics of the United States Geological Survey.

A. MINERALS INSUFFICIENT FOR DOMESTIC NEEDS

All of the minerals of the first group are necessary in our commercial economy and will be imported no matter what tariff is placed on them. Tin ore, diamonds, and graphite in lump form are three mineral products that the United States lacks almost entirely.

We do have some amorphous graphite, to which reference will be made again. Flake graphite is put in the second group.

ANTIMONY ORES

Our experience during the war showed that sufficient antimony to supply the needs of the United States cannot be produced from our known deposits at five times the price of 1913, the last normal year, or seven times the present price of 5.5c. per lb. Even at a price of 14 to 16c. which the proposed tariff would probably put on the metal, it is likely that not over 500 of the 7,500 tons normally used in this country could be produced. Ten cents per lb. above the normal market price for

7,500 tons would be \$1,500,000, that someone would have to pay as a tax, although the revenue that the Government would receive would be \$100,000 less. Besides the deposits in our own country, Americans own considerable antimony deposits in Mexico.

COBALT OXIDE

Cobalt oxide is produced in only one mine, that at Fredericktown, Mo. Queerly it is controlled by Canadian capital, and Americans produce much more cobalt ore in Canada.

TIN

We produce not more than 200 tons of tin concentrate per year, say 135 tons of tin, and we can not enlarge this notably. The war put a price of 75c. to \$1 a pound on tin for a considerable period, but production did not increase. Great Britain, through her assiduous and long-continued collection of unprotected territories, has acquired about 50 per cent of the world's tin deposits, not including Siam's, which she also virtually controls, but the United States, a non-producer, uses about 80,000 short tons (1918 figures) out of a world's production of 131,000 tons, or more than 60 per cent, and it seems possible to control commercially only a part of the ore necessary. The largest independent miner of tin ore is Bolivia, which produces 28,000 tons of tin in ore that is shipped to other countries for smelting, equivalent to more than one-third of our requirements, and it is possible that more ore may be mined under the initiative of outside capital.

Years ago the spectacle of American tankers carrying kerosene to Asia and coming back empty moved some American capitalists to build a tin smelter at Bayonne, N. J., with the idea of smelting tin concentrate to be brought back by the tankers from the Malay Peninsula, but a British company had a smelter at Singapore and the government promptly placed a 33½ per cent export tax on the ores and the smelter at Singapore continued a strict monopoly. The Bayonne smelter was put out of business, but five others have grown up, and all the Bolivian ore can now be handled here, though much of it goes to Europe and Singapore. Excellent electrolytic tin, apparently fit for all purposes, is now made here. A tariff on ores will give revenue, but cannot build a tin mining industry.

It must be remembered, however, that the United States cannot buy ore sufficient for her needs, for she uses 60 per cent of the world's output, and, including Siam's output, Great Britain controls nearly 60 per cent.

A duty of 10c. per lb. on tin would make an extra cost of \$3 a ton on tin plate, and unless a rebate were allowed on export material, this might readily kill the export trade. Americans, however, would have to pay the increased cost.

Americans have several million dollars invested in tin mines in Bolivia and other millions invested in tin mines in the Federated Malay States and China.

GRAPHITE

This country has no deposits of lump graphite, from which the best crucibles are made, but imports its supplies from Ceylon, the one great producer, and Americans are interested financially in Singalese deposits. Our American deposits of amorphous graphite are not to be compared with the deposits in Sonora owned and operated by Americans. These deposits formerly fur-

nished and probably yet furnish the graphite for the best lead pencils of both domestic and foreign make. The heavy duty proposed, about 100 per cent on flake graphite, is probably aimed at the Madagascar flake, which really competes with the American product, but the tariff on amorphous graphite is from 167 to 200 per cent of the 1913 prices.

DIAMONDS

The problem of the diamond is only a phase of the "woman question." The diamond millionaires of Great Britain, forming one of the most rapacious and complete monopolies known, were created and are kept growing by the American bride-to-be. Her solitaire is usually far more expensive than the young man can properly afford, and the price is maintained and kept up to all the traffic will bear. The mass of diamonds are indefensible luxuries for which prices beyond all reason are charged and paid to satisfy mere whims, so that no objection can be made to a tariff of any sum. A smaller part of the diamonds imported are for serious use. (It is not, however, intended to suggest that being a bride-to-be is not a serious matter!) They are the borts or imperfect stones and the carbons or amorphous diamonds, and are used in diamond drilling, glass cutting, etc., and a duty on them is a tax on necessities and especially on mining. The prices for these stones reflect the prices on gem stones and are out of all reason, even without a duty.

IODINE

Iodine has so far been produced only experimentally in this country. It comes from Chile, where it is obtained as a byproduct from the nitrate deposits in which American firms have millions of dollars invested, and can be produced in quantities far beyond the world's needs.

NICKEL

The suggestion that a tariff be placed on nickel is probably not to be taken very seriously. The richest nickel deposits in the world, those of Sudbury, Canada, are largely held by the International Nickel Co., an American company, and this company also supplies the larger part of the world's manufactured nickel. The investments of the company in Canada are valued at many millions. Under no imaginable circumstances could the United States supply its needs of the metal.

On none of the minerals of the first group except diamonds for gems does a tariff seem justifiable.

B. MINERALS INSUFFICIENT FOR DOMESTIC NEEDS EXCEPT AT ARTIFICIAL PRICES

In the group of minerals insufficient for domestic needs except at artificial prices are several minerals of which it is conceivable that if the price were high enough the entire needs of the United States might for a short time be supplied from domestic mines. During ordinary times, however, it has been found expedient to import a considerable part of our supplies, the proportion varying from almost the total quantity of potash to a comparatively small part of our flake graphite and mercury.

With the exception of monazite, this group of minerals was of enormous use in carrying on the Great War. Except for aluminum, graphite, mica and pyrite, these minerals were almost or quite irreplaceable by substitutes. We have not yet joined the League of Nations

and there is as yet no insurance against war. Few thought the Great War possible, another may be nearer than we think.

Using for our nation the same sort of thoughtful care that we do for our families, what must be our attitude toward these deposits, the depletion of which, comparative or total, is apparently only a handful of years away?

BAUXITE

An important item that must be stressed when considering the cost of minerals is the matter of purity. Thus American bauxite ordinarily carries from 8 to 9 per cent SiO_2 , against 2 to 3 per cent SiO_2 in good foreign material, and only 55 per cent Al_2O_3 , against 62 per cent Al_2O_3 in the foreign ore. These differences are equivalent to an added cost of several cents a pound to the manufacturer if he must use the lower grade mineral. The same reasoning applies to chromite and manganese ores, to monazite and pyrite. The mass of domestic ores are of lower grade than the imported ores, and if the American metallurgist is compelled to use them either he must bear the added expense of reduction, or he must pass the cost along with the duty to the ultimate consumer—to you and to me, and to William Jones and John Brown, who are so lost in the crowd that, like the grains of sand on the beach, we blend in blurred obscurity unless someone stoops to look at us.

CHROMITE

Under the desperate needs of the Great War we produced 82,350 long tons of chromite averaging 50 per cent or less Cr_2O_3 at \$48 per ton, but at the same time we imported more than 100,000 long tons averaging 50 per cent or more Cr_2O_3 at \$28.88 per ton. That is, we produced four-ninths of our needs at a cost one-third higher than that of the five-ninths imported. Not only were the actual costs higher during the war, but an indirect cost was added of which little account was taken. That was the excess of cost in working lean concentrates, of which I have just spoken. At a time when every pound of coal and every bit of electrical energy was so greatly needed, we had to waste a great deal of it in slagging off useless rock. This was a tax as burdensome as the higher prices, but invisible to any but the metallurgist.

MANGANESE ORES

Almost the same conditions applied to manganese ores. Our own deposits were mostly small and mostly poor. Some high-grade deposits were developed and some are now known, but they are very much smaller than our needs, and must have high prices to work successfully. The manganese deposits associated with the copper ores at Butte (rhodochrosite) and Phillipsburg, Mont., are large, and water power is conveniently developed, but mining is expensive and the ore is not the cheapest to reduce. But even under war conditions, we cannot produce the ores we need, and under peace-time conditions higher grade ores at much lower prices can be readily obtained from India, Brazil and Russia.

Americans own large manganese deposits in Brazil, and other deposits are owned in Mexico and India, involving investments of probably \$5,000,000.

MONAZITE

The proposed tariff on monazite is another case of a proposal to compel the use of American material of lower grade and higher price. The marketable mona-

zite from the Carolinas carries only 4.5 to 5.5 per cent ThO_2 , against about 6.5 per cent in the Brazilian monazite, and 8 to 9 per cent in that from Travancore. If the bill passes, either the waste of chemicals and the extra freight and labor costs required to use the American material or trebled cost for foreign "sand" must be faced. It is worth mentioning that John Gordon, an American, is the principal Brazilian monazite producer.

TUNGSTEN ORES

Tungsten ore is another particularly bad subject for a tariff. In 1917, under prices at least three times the normal and which had existed for two years, we were able to produce a little more than one-half of our needs. In 1918, under similar prices, we produced one-third of our needs. Under a price of \$17 per unit, two and one-half times the normal price before the war and the price which it is hoped will be reached under the proposed tariff of \$10 per unit, it does not seem probable that the United States can produce more than 3,000 tons per year for three years from the deposits now known. Indeed this seems a rather optimistic estimate. Remembering the intensive prospecting of the war period, we have no reason to expect the discovery of deposits that will greatly alter the situation.

Americans own tungsten deposits in Bolivia, Mexico, Portugal, Argentina, Korea and Siam, worth probably a million dollars. The imposition of a tariff will, of course, prevent their shipping their ores to this country.

PYRITES

Before the Great War most of our sulphuric acid plants were fitted to use pyrite only, and great cargoes were brought from Rio Tinto, Spain, to supplement domestic supplies. Huge quantities of acid are made from waste gases from smelters, and sulphur is now being burned in large quantities for acid making. The usefulness of sulphuric acid depends largely on its cheapness, and a high degree of civilization demands cheap sulphuric acid, but tariffs on pyrite and sulphur mean dearer acid. In their need for pyrite, Americans were forced to buy pyrite mines in Canada and have considerable money invested in them. Their output will be affected by the tariff like any foreigner's product.

MERCURY

Of mercury the United States mines about half of the world's supply, but according to testimony before the Ways and Means Committee our ores carry only about 8 lb. to the ton and our cost is 93c. to \$1 a lb. According to the same testimony, Spanish quicksilver is produced at a cost of 50c. per lb. During the Great War, the price of mercury reached \$125.89 per flask of 75 lb. If the figures for costs of production are accurate, American mercury cannot compete with foreign mercury even under the proposed tariff, for it certainly cannot be put on the market at less than 20 per cent gross profit. This added to the cost of \$70 to \$75 per flask will make a price of \$84 to \$90 per flask. The Spanish producers, if their costs are given correctly, should at the same rate of profit be able to lay their mercury down in this country at slightly less. Either the figures are wrong or the tariff proposed by the miners will be futile. For years American mercury has been sold for export at \$5 per flask under the domestic price.

FLAKE GRAPHITE AND MICA

Of flake graphite the deposits of the United States are comparatively large, and Americans are known to be interested in flake graphite deposits in Canada. The Madagascar flake is better than the American, and will probably be imported in spite of a tariff, the duty merely adding to the user's troubles.

Mica is mined from pegmatite dikes and like all pegmatitic minerals is proverbially in uncertain quantity. The mining of mica in this country has always been so precarious that large users have invested in Canadian deposits in order that they might be sure of their supply. No one can foresee or foretell what the future supply will be. It is peculiarly an industry adapted to countries like India, where labor is cheap. Prices for mica have always been very high, and with the advent of the great electrical industry they have become higher. It is at present a small industry employing very few persons.

POTASH

So far very few deposits of soluble potash salts have been found in the United States. They are confined to the small brine lakes of northwestern Nebraska, the salt fields in Great Salt Lake Desert, and Borax Lake in the Mohave Desert, California. There is no likelihood of our being able to supply our needs from these sources. More laboriously, potash is being obtained from kelp along the Pacific Coast, from the dusts of cement mills, from wood ashes, from alunite and from green sand marls of the Coastal Plain. Experiments without number have been made on the production of potash from the feldspars and other silicates, but to date these have not met with commercial success, though the use of glauconite is promising. We are still, and probably will be for a good while, dependent on the German and French deposits for a large part of our potash. The proposed tariff will add 75 per cent to the cost of potash, and may encourage continued experiments on the extraction of potash from the silicates. Potash is used mostly in fertilizers that are used in farming, the most poorly paid of the basic industries, and by the farmer must the cost of the experiments be paid. The passing along of the tax is in his case a grim pleasantry, for he does not and cannot fix the price of his products.

VANADIUM

The proposed vanadium tariff is probably not to be taken too seriously. More than half of the world's vanadium comes from the unique deposits at Minaragra, Peru. The deposits are American owned and operated, and recently changed hands at a price of \$3,000,000.

Our own vanadium deposits are mostly in southwestern Colorado and southeastern Utah. A large part of the output is made as a byproduct from radium ores.

It is likely that at recent prices we can supply most of our needs for five years or more from the known deposits.

MAGNESITE

Under normal open market conditions, magnesite has been a comparatively cheap mineral, but it is heavy and bulky. The American mines are located in California and Washington, but the principal users, the steel mills, are located from Chicago eastward to Buffalo. The California deposits are comparatively small, and for many years were worked with the tacit acknowledgment that without an unreasonable tariff they could not well

compete with the Austrian magnesite on account of the much greater size of the Austrian deposits and the high freight rates from California to the Eastern steel mills. Before the Great War it was not always easy to get supplies of magnesite as they were needed and one of the large American magnesite brick manufacturers bought an Austrian deposit and invested altogether \$1,000,000 in the project. Other Americans bought and operated magnesite deposits in Venezuela, Lower California and Canada.

In 1915, the year following the outbreak of the war, when all imports were cut off, Austrian calcined magnesite was selling for from \$25 to \$26 a ton in New York, and brought as high as \$60. The deposits near Chewelah, Wash., were rediscovered, and the high prices and shortage of magnesite offered an excellent opportunity for their exploitation. One company made an investment of nearly a million dollars and another company made an investment of half a million. At the prevailing prices and shortage of the material even the California deposits were enabled to ship to the East, and large developments were made. But the war came to a close and left the large Washington investments unamortized. With the cessation of hostilities in Europe, the usual sources of magnesite again became more or less available, and railroad freight rates had meanwhile increased largely so that neither the Washington nor the California operators would have been able to ship magnesite in competition with the European producers, even had the demand not collapsed with the steel business. It is now proposed that a duty of \$25 per short ton of calcined magnesite, equivalent to more than 150 per cent ad valorem, be levied, making the price to the Eastern consumer at least \$41 per short ton of calcined magnesite, and probably nearly as high to the Western buyer.

On the crude magnesite a duty of \$15, or more than 200 per cent, is proposed, making the cost at least \$22 per ton. Should the consumption be equal to that of 1913, it would be equivalent to 172,591 tons of calcined and 161,967 tons of crude, on which would be levied a total tax of \$6,740,000. It is explained that the cost is distributed over so many tons of steel that it will be unnoticeable. It will, however, put out of business the Americans who have invested in mines in foreign countries.

The proposed tariffs are so high that, if put into effect, they may defeat their objects, for at these prices it seems possible to make profitably an artificial magnesite and thus leave the Western mines without their market.

BAUXITE AND ALUMINUM INDUSTRY

It is impracticable to consider the tariff in relation to all the minerals as such and without regard to the manufactures from them; thus bauxite must be considered with aluminum. In the United States the aluminum industry is centered in a single company. It owns most of the American bauxite deposits and controls most of those in the Guianas—the best and largest known. This company, the Aluminum Company of America, has a monopoly of aluminum production both in the United States and Canada, and in 1919 its capacity in the United States was 90,000 short tons of the world's plant capacity (exclusive of Canada) of 270,000 tons, and including its Canadian plant, possibly 210,000 tons, or about 70 per cent of a total of 310,000 tons. It has kept free from competition probably as closely as any other American company.

It has net assets of more than \$110,000,000, apparently mostly derived from earnings.¹ Inquiry along this line at the tariff hearings was not allowed to proceed. The representative of the company admitted that it had had, through its Canadian branch, a selling agreement in Canada and Europe which on account of the law did not apply to the United States. The cost of manufacture is supposed to be from 12c. to 13c. a lb. The selling price is from 28c. to 30c. a lb. In the committee hearings no data were brought out or asked for on this point. In its brief the company speaks of using only Arkansas bauxite of low grade, although in British Guiana the company owns the finest known bauxite deposits, and has brought in large quantities of the ore.

A tariff on bauxite means a burden on any company that might have the temerity to try to compete with the Aluminum Company of America, and further profit to the present monopoly. Aside from raising revenue, it can do no good. The company manufactures aluminum products and a tariff on the metal means more profit to the company, added cost to competitors in the manufacture of aluminum articles, and added cost to the consumer.

IMPORTANCE OF SOME ORES IN MODERN WARFARE

Manganese, chromite, quicksilver and tungsten are indispensable in modern warfare. Without manganese the making of steel is immensely more difficult; without chromite armor plate is useless and tool steels sink to a level little higher than carbon steels; mercury makes our best percussion caps, and without tungsten high-speed steels we would have been unable to equip enough factories to turn out our munitions in the Great War.

It is possible that very high artificial prices may cut part of the metals off from some of their most useful though as yet unproved applications. This may be shown by chromium. Stainless steel, an alloy of 13 to 17 per cent chromium with iron, is remarkably resistant to rust and seems to offer great possibilities of usefulness. As an example, concrete sea walls now destroyed by the rusting of the steel reinforcement would probably stand indefinitely were stainless steel bars used for reinforcement. The extra cost for such material would be much less than the cost of replacing the walls.

In many oil wells the pipes are destroyed by corrosion long before the well is exhausted. In certain favored wells it seems possible that a stainless steel casing could be used. The present cost of the chromium in a ton of such steel would be from \$40 to \$50 per ton, and must be near if not above the limit of cost. The heavy duties asked may well be the deciding factor for such possible uses.

In proposing heavy duties on these minerals, the plea has been that there is great need of home development so that the Government might have the necessary quantity of the minerals in case of another war, and that the mines should be kept in a state of development so that the ores could be quickly obtained and that if the mines were allowed to close they would be flooded and ruined.

This is merely plausible sophistry, for no man will develop ore bodies to let them stand for the Government's convenience. Development means depletion, and a tariff on the ores means a premium on early depletion. Flooded and caved mines are bad, but exhausted

¹Hearings on general tariff revision before the Committee on Ways and Means, House of Representatives, Pt. 2, pp. 894-921.

mines are useless. If the Government held in stock supplies of these ores large enough to carry us through a considerable period of another great war, such a situation could be faced with more equanimity.

MINERALS SUFFICIENT FOR THE IMMEDIATE FUTURE

In the group of minerals the deposits of which seem to be sufficiently large to furnish our needs for an indefinite time are two of the principal industrial metals—lead and zinc; two elements usually recovered only as byproducts—white arsenic and bromine; molybdenum, a metal apparently just finding its use; and a number of non-metallic minerals, particularly sulphur. Of lead and zinc the United States is the largest producer. The only difference between the minerals of Group C and Group B is that our supply is larger, but the end is just as definite and as certain to be reached.

If I understand the pleas for a tariff on zinc aright, however, it is not that we cannot produce in competition with the world, but that many of our poorer mines cannot compete. So far as I know, no figures of costs are given for the Franklin Furnace mines nor for the best of the northeastern Oklahoma mines. For many poor mines undoubtedly the costs are higher than the market price, but that would be true if the price were a dollar a pound. The principle advocated seems to be that when once a camp is started the tariff should follow rising costs in order that the operators may continue to make money until the zinc ore is all mined. If for poor zinc mines, why not for every non-paying industry?

Much the same arguments apply to lead. It is, however, a remarkable and disconcerting fact that if we except the continuance of the Joplin field into Oklahoma, the Bawdwin deposit in Burma is the only really large new deposit of lead that is known to have been found anywhere in the world in the past ten years. This shows how much nearer the end of the mines may be than we have thought.

Bromine is saved as a byproduct from salt wells and will be saved only if the price and demand justify. Arsenic is caught in the fumes at the great copper and precious metal smelters and practically must be saved to prevent its being a nuisance. Though some is now being made from arsenopyrite, no direct production is needed if the fumes are saved. Before the great increase in freight rates it could be marketed very cheaply. The duty asked, 5c., is probably more than a 100 per cent tariff on cost f.o.b. New York.

Our supplies of sulphur are comparatively large and cheaply produced from the domes of Louisiana and Texas. It is difficult to see how anyone can compete with them more than temporarily. If prices on both pyrite and sulphur are revised upward by high tariffs, the price of sulphuric acid, fertilizers and other materials must rise accordingly, or be kept from approaching pre-war levels.

MINERALS IN LARGE QUANTITY

The minerals in large quantity are mostly those generally referred to as non-metallic, by which we mean that the compounds are more useful than the contained metals are after isolation. They are mostly bulky materials and the supply approaches infinity so far as human industry is concerned. Thus the ocean is a huge salt bed in solution and an inexhaustible supply of magnesium ore.

In these bulky products, position, freight and labor, rather than foreign competition, may cut the largest figures, and unless carefully drawn laws are made one locality may be placed at the mercy of a particular company.

This may be illustrated by a story told some years ago by a gentleman connected with a cement company. The company owned cement plants near the boundary in both this country and Canada. When a former tariff law was being framed in this country, he went before the Ways and Means Committee and asked for a specific duty of \$1 a bbl. on cement to keep out the "pauper-made" cement of Canada and other countries, explaining that an earlier tariff of 20 per cent was equal to about \$1 a bbl. He did not explain that, at the earlier date, the price of cement was \$5 a bbl., but that at the time of his plea cement was being made profitably as low as 70c. a bbl. Then he went to Canada and petitioned for a tariff of 20 per cent against the American cement, as he wished to put up a mill in western Canada, where an extensive region was being supplied by a recently erected American plant. After both tariffs were granted, a new plant was built to supply the field in western Canada, and both an American and a Canadian community were compelled to pay tribute to the company.

Before the war anhydrous magnesium chloride used as a source of magnesium and as a component of oxy-chloride cements came from Germany, where it was made as by a byproduct of potash refining. Probably it has not been very successfully made anywhere in this country, though the hydrous chloride is easily made.

Phosphorus is made in the electric furnace from lime phosphates. The other items are so familiar that little explanation is needed except as to coal.

M. R. Campbell estimates that at the present rate of use we have coal enough for 4,000 years, but the best steaming coal is being used rapidly and may not last more than fifty years, so that this might well be separated and put under Class C. Of the lignites and other poor coals the supply is huge, but on the other hand our uses are increasing at a rapid rate. As the United States is the largest exporter of coal, a tariff could have the effect only of raising the already high price in some poorly supplied locality like the Pacific Coast.

The fixing of a tariff on this group of minerals may well follow the same considerations as are applied to the fixing of tariffs on manufactured articles or farm products.

GENERAL CONSIDERATIONS

Some repetition in an effort to emphasize some of the points raised in this paper may be pardonable.

Of certain necessary minerals and metals we have practically none. Of certain other minerals, the bulky and common class, our supplies are very large, and of a few like salt, magnesium and lime, the supplies are, so far as human industry is concerned, unlimited. Between these two groups of minerals are two other groups. Of one we have a known quantity sufficient for our needs for a short time only and at highly artificial prices. Of the other we have a supply that is sufficient for our needs for some time to come. To all of the deposits of these two groups there is a definite end. Using them is precisely like drawing the water from a cistern, except that an ore deposit is filled only once, and when once mined, it is gone. There is no second crop. They are wasting assets.

Of the first group, that which we lack entirely, diamonds for gems are luxuries sold at absurdly extravagant prices, and no valid objection can be made to a duty of an amount comparable to the price. On the other substances, except borts and carbons, tariffs may be levied according to the theories of the party in power without directly affecting the mining industry of this country. To the last group tariffs may be applied much as to manufactures.

The minerals of the two middle groups, except bromine and arsenic, deserve entirely different consideration. Bromine and arsenic may also fairly be treated as manufactured products, for bromine will be saved from brines only if it pays, and arsenic can be supplied to fill all our needs as a byproduct from the smelters. We have the others in limited quantity. To place a tariff on them is to place a premium on depletion and to hasten the day when they too will be among the minerals of which we cannot supply our own needs. To bring that day more quickly than necessary is economic crime.

The civilization that we enjoy and that we are attempting to intensify is making more and more use of mineral products. To our grandfathers nickel was a curiosity; to our fathers aluminum was an unseen metal; tungsten, vanadium and chromium were heard of only among the abstruse things of chemistry. To us they are all necessities, and perhaps the Great War was won so soon because Germany lacked tungsten.

The mineral products are becoming more and more indispensable to us and depletion of deposits more and more of a menace. A hundred years ago iron furnaces were operated on chunks of iron ore picked up between Washington and Baltimore; now a single blast furnace will turn out as much pig iron in a day as one of those furnaces would in months, and it must have a large and assured ore supply to guarantee operation. When our great Lake Superior iron deposits were discovered they were heralded as inexhaustible—but our iron and steel industry has grown so that already we have had to commence beneficiation of the lean Lake Superior ores, and American firms are exploiting iron deposits in Cuba and Chile. It is probable that in 100 years the owners of the Brazilian iron fields will control the world's steel trade.

We have been the world's greatest copper producers, but our energetic mining firms have found it expedient to take over the great copper deposits of South America.

Besides these great investments by the most powerful of our mining interests, many smaller investments have been made in foreign mines—made at a time when our every endeavor has seemed to be to obtain foreign trade. These men have retained their American citizenship, and their ties with the United States are very real. Uncle Sam never forgets them when their income tax is due and they pay precisely the same rates as those of us who live at home where we have some advantage from the tax. These men have been, and are, the advance guard of American exports. They buy American machinery, foods and clothing; and in very many places they import American timbers for their mines and American lumber with which to build their mills. They are probably our best field agents for American exports. Do we believe in American exports, or is it mere cant?

Some of the American owned foreign mines are so close that the minerals are brought into the United States by aerial tramways; others are in the snowy heights of the Andes and in torrid India.

Probably the total American investment in foreign mines amounts to between \$600,000,000 and \$1,000,000,000, and if our metallurgical industry grows with our population it will mean greater and greater foreign investments. Are these then to be forgotten when we are passing tariff legislation?

Not only our own Americans but other miners in foreign countries are willing to sell us their cheap and rich ores. If we insist on making our own ores expensive by placing a protective tariff on foreign ores, then we place in the hands of our competitors the cheap ores of the world, and our manufactures must be increased in cost. The proposition that ores intended for incorporation in goods to be exported will be relieved of duty only half answers the question. Our own machinery and the manufactures of our own country must yet be made of the expensive ore, and the cost is passed on to the consumer, with the argument for each duty that it affects him little. Straws broke the camel's back.

But above all, the tariff puts a premium on the early depletion of our deposits. It will leave posterity only the caved mines that might have been an asset to them. Posterity will have to buy from the foreigner his deep mined ores and the United States will always work on expensive metallic products. The cynical question, "What has posterity done for us?" so glibly asked in reply to such an objection, may be answered by another and more honest question:

"Shall we rob our children?"

Imports of Carbonate of Potash Into the U. S.

There was 33,380,205 lb. of carbonate of potash, valued at \$1,218,851, imported into the United States during the calendar year 1920. The countries of origin were as follows, according to data compiled by the Statistical Division of the Bureau of Foreign and Domestic Commerce:

Countries	Lb.	Value	Countries	Lb.	Value
Austria.....	11,023	\$3,914	Switzerland.....	5,089,720	\$214,274
Belgium.....	227,736	3,702	England.....	346,735	35,716
Czechoslovakia..	170,854	26,695	Scotland.....	10,000	452
Denmark.....	22,386	5,148	Canada.....	61,529	4,414

Largest Electrified Sugar Mill in Central America

It has been decided to electrify the new sugar mill of the Sula Sugar Co. at La Lima, Honduras, and plans have been drafted which will make it the largest electrified sugar mill in Central America. Power will be developed by a 1,000-kw. turbo-generator set with an auxiliary set of 200 kw. for lighting and general purposes. All the electrical equipment will be furnished by an American company and installation will be made by the same American company that is constructing the mill. The fuel to be used for running this system will be cane fodder and scraps, the supply of which is expected to be sufficient. Construction of the new mill is going forward rapidly. The boilers have been set in place and smokestacks and water towers erected. Most of the heavier machinery is also installed and the machine shop is nearly completed. Consul Albert H. Gerberich, Puerto Cortes, Honduras, reports that the first cane will be crushed in October.

Preventing Corrosion in Iron and Steel Under Water*

The Intensity of Corrosion Under Water Is Almost Proportional to the Amount of Oxygen in Solution—Mechanical and Chemical Means of De-aërating the Water, Thus Retarding the Rate of Corrosion

By F. N. SPELLER

Metallurgical Engineer, National Tube Co., Pittsburgh, Pa.

THE electrolytic theory of corrosion as formulated in 1903 by Dr. Whitney has led to the development of certain protective systems which are based on the removal of dissolved oxygen from water. Careful experiments in the research laboratories of the Massachusetts Institute of Technology and the National Tube Co. have demonstrated that the amount of corrosion found is almost directly proportional to the amount of oxygen in solution and varies directly as the temperature. The predominating influence of free oxygen in water was suspected before this as a result of the early study of pipe corrosion, for the most striking fact in practical pipe experience is that hot-water-heating systems invariably showed no corrosion to speak of after 35 or 40 years' use, whereas frequently hot-water-supply systems operating at the same average temperature with the same water lasted only six or eight years. That this was independent of whether the material was iron or steel was fully demonstrated by many service tests which were conducted for a period of over ten years, in which representative pipes of each class were installed alternately in hot water lines. A few of the more recent tests by independent observers are given in Table I for reference. It is believed to be unnecessary in view of this evidence to refer to any of our older investigations recorded elsewhere several years ago.¹ Suffice it to say that all the reliable data on this subject which we have seen up to the present indicate that the composition of the iron—i.e., the varying amount of carbon, phosphorus, manganese, sulphur, silicon, oxides, slag and copper usually found in wrought iron and soft steel—makes very little difference on the amount or character of corrosion under water. This refers particularly to the depth of corrosion commonly known as pitting.

INFLUENCE OF MILL SCALE ON PITTING

The location and depth of pitting seem to be mainly determined by variations of potential on the surface of the metal, principally due to the mill scale in irregular patches usually found on the surface of rolled iron or steel. Welded pipe and tubes having a particularly heavy and tightly adhering scale are on this account susceptible to pitting. It has been found by experimenting that the useful life of the tube as measured by the time to perforate is materially increased by removal of all mill scale and rust. Several years ago, after considerable study of the influence of mill scale on corrosion of iron in service, the National Tube Co. gave me the opportunity to make an attempt to remove this scale from pipe. A butt-weld pipe mill was provided with

special machinery for this purpose. The pipe was made about 10 per cent larger than standard. After welding it was cooled to about 1,700 deg. F. and passed at this temperature through a train of circular reducing rolls by which the section was reduced to standard size, and the pipe elongated, thus breaking loose all scale. The usual straightening operations followed during which a light loosely adhering scale formed which has little influence on corrosion and is easily removed if desired by pickling.

In the absence of oxygen such electro-negative materials as mill scale, oxides of iron, copper or brass have much less influence in accelerating corrosion.

It is necessary to establish these points before entering on a practical consideration of the subject of protection of steel, which in the case of closed systems can evidently be accomplished in most cases by elimination of dissolved oxygen from the water.

In practice oxygen removal has been accomplished economically in two ways, namely: By de-aërating the water mechanically and by fixing the free oxygen by chemical combination.

MECHANICAL DE-AËRATING OF WATER

The mechanical de-aërating of water is accomplished by passing the water over baffles or spraying into a high vacuum chamber at normal temperature or by increasing the temperature and controlling the pressure and temperature so that more or less complete removal of all the gases is obtained.

One system which has been proposed involves heating the water above the boiling point corresponding to

*Paper presented at the spring meeting of the American Electrochemical Society at Atlantic City, N. J., April 21, 1921.

¹Comparative service obtained with wrought iron and soft steel pipes as water lines in the United States. International Association for Testing Materials, New York, 1912.

the pressure and spraying into a chamber at lower pressure. The air and aqueous vapor are drawn through a condenser where the vapor is condensed with a simultaneous transfer of heat to the incoming cold water. Almost perfect removal of gases is said to be accomplished in this way and there is no reason why nearly perfect removal cannot be thus obtained with a properly designed plant, but the condenser and other apparatus required makes such a plant quite costly and subject to severe deterioration.

For practical protection of water pipe from internal corrosion at 180 deg. F. (80 deg. C.) it is not necessary to have the oxygen lower than 0.4 c.c. per liter (cold water carries from 5 to 10 c.c. per liter, depending on the season of the year and temperature). For the protection of steam boilers, superheaters and economizers operating at a much higher temperature, the oxygen should be below 0.2 c.c. per liter or an appreciable amount of corrosion will occur. This may be accomplished by means of de-aerators now on the market, which are simple in construction and operate without heating the water to the boiling point. (Fig. 1.) The design of the apparatus used should be adapted to the particular conditions in each case. Several of these are in use doing good work in the protection of iron and steel hot-water piping systems and boilers. A large system has recently been installed to de-aerate 5,000,000

to 20 per cent of that previously experienced, this being a very corrosive water.

FIXING FREE OXYGEN BY CHEMICAL COMBINATION

The fixing of the free oxygen in the water by chemical combination has been carried out in practice in the case of hot-water systems by passing the heated water through a storage tank carrying a mass of expanded sheet iron giving about 60 to 70 sq.ft. of surface per cu.ft. of space (200 to 230 sq.m. of surface per cu.m. of space). In half an hour or so at 170 deg. F. (77 deg. C.) the oxygen may be reduced in this way to 0.3 c.c. per liter. If the water carries free CO_2 and bicarbonates, as is usually the case, the free CO_2 contents are often a little higher after this treatment, notwithstanding which practically no corrosion is found. My first experiments with the use of scrap iron in 1907 were made with steel turnings, which after a time clogged up tightly into an impermeable mass. This difficulty was overcome by the use of expanded steel sheets suitably formed so that they would not pack tight. The first plant of considerable size based on this principle was designed and built by the author in Pittsburgh in 1915, and has now been in successful operation for over five years; the essential features involved are indicated in Fig. 2. For domestic use the water after this treatment should usually be filtered.

COMBINATION OF MECHANICAL AND CHEMICAL DE-AERATION

This method of "de-activation" (the term suggested to designate this process) may be used to supplement mechanical de-aeration as described above, which combination seems to be the most economical means for oxygen removal from hot water on a large scale under average conditions. For example, take a power plant equipped with open-feed water heaters operating at 180 deg. F. (80 deg. C.); it will be found possible by means of the heaters alone to reduce the free oxygen in the feed water from 8 c.c. to 2 c.c. per liter. If the water space of the heater is filled with thin steel lathing or the water, preferably in some cases under reduced pressure, be made to flow through another tank containing steel scrap in this form, the residual oxygen will be fixed in a few minutes. Water so treated is practically inactive toward iron, and may be used in boilers or steel economizers without fear of corrosion so far as the water is concerned.

Other metals in scrap form may be used for oxygen removal, such as zinc, but iron is the most economical, not only because of its low first cost but for the reason that the ferrous hydrate formed removes an equivalent of oxygen in addition to oxygen taken up by the hydrogen. Furthermore it has been proved to be true, as would be inferred from the above, that the corrosion of zinc, brass and other metals is greatly retarded if not entirely stopped by the removal of oxygen from the water which comes into contact with these metals.

Brass and copper piping are seriously attacked by heated water under pressure. For example, we find that the water which is heated for our laboratory in a copper coil heater of the usual type loses nearly one-half of its free oxygen in passing through this heater, and brass pipes after ten or twelve years are frequently found to have lost nearly all their zinc contents. The same has been observed with alloy condenser tubes, so that there is apparently an important field for the application of these principles of protection to brass and copper piping systems.

FIG. 1. MECHANICAL WATER DE-AERATOR

In operation the cold water enters the aerator at the bottom and flows upward through the coils, taking up some heat from the down-flowing water. The temperature of the water is raised to about 205 deg. F. (96 deg. C.) as it passes through the middle steam-heated compartment. From this the water rises and flows over baffles, where the air is nearly all separated, the residual oxygen being removed by some suitable de-activating material before the water passes downward to the outlet, its temperature being reduced to about 150 deg. F. (66 deg. C.) in passing through the lower heat exchanger.

gal. (20,000 cu.m.) of cold water per day for the protection of the 30-in. (75-cm.) steel main from the Darling ranges to Coolgardie mining district, Western Australia, which is reported to have reduced the corrosion

TABLE II. SUMMARY OF RESULTS OF INVESTIGATIONS OF THE CORROSION OF WROUGHT IRON AND STEEL PIPE IN HOT WATER SUPPLY SERVICE

Date	Where Test Was Made	Length of Time Pipe Lines Were Installed	Authority and References	Number of Cases on Record	Average of Deepest Pits, Inches		Conclusions
					Wrought Iron	Steel	
1919	Irene Kaufmann Settlement, Pittsburgh, Pa.	2 yrs., 7 days.	Jas. O. Handy, Technical Director, Pittsburgh Testing Laboratory. Report made to Resident Director Teller, Jan. 22, 1920; p. 97, Jan., 1920, A. S. H. & V. Engrs.; p. 276, Mar., 1920, A. S. H. & V. Engrs.	Fifteen lengths of steel, 15 lengths of wrought iron arranged alternately.	0.1144	0.1095	"These figures show that no marked distinction is possible between the rate of corrosion of the steel and the iron pipe."
1919	Harvard University, Cambridge, Mass.	3 yrs.	Melville C. Whipple Inst. in San Chem., Harvard University. Jrn'l New England Water Wks. Asso., p. 42, Mar., 1920.	Two sections each of scale-free (steel); galvanized steel, copper steel and wrought iron pipe.	0.073	Scale Free 0.045 Copper Steel 0.068 Galvanized 0.078	"Judging from the depths of pitting and the general appearance of the inside of the pipe, it was evident that, so far as the conditions of this particular experiment with the Cambridge hot water service were concerned, scale-free pipe had suffered less real damage than any of the others after three years' exposure."
1919	Irene Kaufmann Settlement (2d Test), Pittsburgh, Pa.	1 yr., 2 mos.	Jas. O. Handy, Technical Director, Pittsburgh Testing Laboratory. Report by Pittsburgh Testing Laboratory, April, 10, 1918, p. 217, 1918 Trans. A. S. H. & V. Engrs.	Six sections each of steel and wrought iron pipe.	0.131	0.122	"This test and other similar tests have shown beyond question that in the Pittsburgh district wrought iron and steel pipes in hot water lines are rapidly corroded by pitting and that the laminated or fibrous structure of wrought iron produced by the included layers of slag, does not give any added durability to wrought iron, as compared with steel pipe."
1918	Brown University, Providence, R. I.	11 mos.	Wm. F. Kenerson, Professor of Mechanical Engineering, Brown University. Report made June 7, 1918. Bulletin 2—"Corrosion of Hot Water Piping." National Tube Co.	Two sections each of black and copper steel and wrought iron; one section each of galvanized and copper steel, galvanized.	0.0674	Black Steel 0.0544 Copper Steel 0.0639 Galvanized 0.0547 Copper Steel Gal. 0.0938	"There is evidently no marked superiority of either the wrought iron or steel for the test conditions described. The wrought iron failed first by developing the deepest pits. The steel developed a greater number of shallower ones."
1917	This test was conducted in four different places as follows: (A) West 41st St. Bath, New York. (B) East 76th St. Bath, New York. (C) East 109th St. Bath, New York. (D) Cherry and Oliver Sts. Bath, New York.	2 yrs., 9½ mos. 2 yrs., 5 mos. 2 yrs., 6 mos. 2 yrs., 6 mos.	James S. Macgregor, Instructor in Civil Engineering, Columbia University. Report made Jan.-March, 1917. Bulletin 2—"Corrosion of Hot Water Piping." National Tube Co.	(A) 3 sections each of wrought iron and steel pipe. (B) 4 sections of steel and two of wrought iron pipe. (C) Same as test B. (D) One section each of steel and copper steel.	(A) 0.057 (B) 0.075 (C) 0.035	0.052 0.070 0.035 (D) Steel 0.021 Copper Steel 0.022	Taking the total averages of steel (which includes scale-free and copper steel, as well as ordinary black), pipe as against those for iron in the four tests we find the latter to have pitted deeper by 0.025 in., which indicates in favor of steel pipe in these particular tests.
1916	Irene Kaufmann Settlement, Pittsburgh, Pa.	11 mos.	Jas. O. Handy, Technical Director, Pittsburgh Testing Laboratory. Report made December 6, 1916. P. 125, 1917 Trans. of A. S. H. & V. Engrs.	Two sections of steel, one of galvanized steel and one of wrought iron pipe protected by deoxidizer; 2 sections each of steel and wrought iron pipe not so protected.	Protected by Deoxidizer (Galvanized) 0.045 (Black) 0.016 Unprotected by Deoxidizer 0.121	0.040 0.016 0.125	This test had as its chief aim a study of the protection of pipe by use of a deoxidizer, and the author does not draw direct conclusions on the comparative corrosion of the iron and the steel pipe. The figures on depth of pitting, however, stand in favor of steel pipe.
1916	Irene Kaufmann Settlement, Pittsburgh, Pa.	10 mos.	Jas. O. Handy, Technical Director, Pittsburgh Testing Laboratory. Report made October 31, 1916. P. 125, 1917 Trans. of A. S. H. & V. Engrs.	Seven sections of steel and 4 of wrought iron pipe.	0.116	0.110	The author states that a certain sample of wrought iron showed the most general corrosion, while a steel section showed the greatest number of separate pits. No direct reference to comparative corrosion is made.

In connection with our tests in Pittsburgh we placed some zinc, brass, and steel-brass and steel-copper plates in contact in raw and de-activated hot-water service for one year with the losses in weight shown in Table I.

The accelerating effect of copper and brass in contact with steel under these conditions has been greatly reduced by the lack of a depolarizer, as would be expected, and it will be noted that the loss in weight of the steel when in riveted contact with copper and brass is very little more than that suffered by the insulated zinc plates in de-activated water under the same conditions. In this experiment the test pieces were placed in two horizontal steel water lines, one carrying raw water

FIG. 2. CHEMICAL WATER DE-AERATOR

In this system the oxygen is removed by combination with scrap steel sheets in the upper tank (the de-activator). The heater circulating pipes and filter are shown.

with about 6 c.c. per liter of oxygen and the other water with an average free oxygen content of about 0.3 c.c. per liter.

RETARDING THE RATE OF CORROSION

The rate of corrosion may be retarded by increasing the proportion of hydroxyl ions with relation to the hydrogen ions present in the water. In practice in the case of boiler water this can be carried out by the use of 5 to 10 grains per gallon of hydroxide alkalinity, but with domestic water it is possible to use only a comparatively small amount of alkali and the protection afforded is proportionately lessened. Great Lakes water with about 8 grains per gallon of calcium carbonate is very much less corrosive than New York city water with 1 or 2 grains per gallon of carbonates, although each have about the same amount of oxygen.

There are cases where natural waters used for cooling purposes in condensers or transformers may have their corrosive activity reduced with economy 50 per cent or more by passing the water through a bed of crushed limestone, but this treatment is not nearly so effective as partial de-aeration and may cause an insulating scale to form if this treatment is carried too far.

The more important research on the subject of relative corrosion of piping in hot water feed service that has been accomplished within the last five years is summarized very briefly in Table II.

Alsatian Potash Production in 1920

Commercial Attaché Huntington, at Paris, has transmitted comparative statistics on the Alsatian potash situation.

The total production of the Alsatian mines in 1913 was 350,341 tons, corresponding to 56,000 tons of pure potash; in 1919 the production was 464,607 tons, corresponding to 92,006 tons of pure potash; and in 1920 the total reached 1,061,191 tons, corresponding to 199,230 tons of pure potash.

The following shows the amount of the 1919 production of the grades named compared with the production of 1920:

Grades	1919 Tons	1920 Tons
Sylvanite, 12 to 16 per cent.....	262,779	664,019
Rich sylvanite, 20 to 22 per cent.....	163,714	335,820
Chloride of potassium, 50 to 60 per cent.....	38,114	61,352
Total.....	464,607	1,061,191

Shipments during 1919 and 1920, expressed in terms of pure potash, were in amount as follows:

Grades	To France		To United States		To Other Countries	
	1919 Tons	1920 Tons	1919 Tons	1920 Tons	1919 Tons	1920 Tons
Sylvanite, 12 to 16 per cent.....	20,820	43,994	11,022	27,355	6,303	25,557
Rich sylvanite, 20 to 22 per cent....	16,260	31,420	8,276	19,720	9,096	17,679
Chloride of potassium, 50 to 60 per cent.....	9,973	11,164	3,849	8,892	6,407	13,394
Total.....	47,053	86,578	23,147	55,967	21,806	56,630

Since March, 1921, the concentration plants of the Alsatian potash mines have been manufacturing rich sylvanite of 30 per cent K_2O content and sylvanite of 40 per cent K_2O content.

Niagara Hydro-Electric Canal Nearing Completion

The hydro-electric canal is and has been making rapid progress toward completion. This great public work has been especially favored by the weather, which made it possible for the work to go on unimpeded during the past winter.

Of 13,500,000 cu.yd. of earth excavation, 12,500,000 cu.yd. has already been removed; while of the 4,000,000 cu.yd. of stone excavation, 2,500,000 has been taken out. This speed in the removal of earth and stone has been accomplished by shovels which excavate 8,500 cu.yd. of earth or 3,000 cu.yd. of stone in twenty hours with two shifts of men. These shovels handle 8 cu.yd. of earth or 6 cu.yd. of stone at a time. The deepest cut in the canal is 135 ft.

At the present rate of progress the earth excavation will be finished by July next and the stone excavation by August. The excavation of earth and stone are now ahead of schedule.

There is 280,000 cu.yd. of concrete work in the walls of the canal, while in the power house, screen house, intake and control works there is 145,000 cu.yd., making a total of 425,000 cu.yd. of concrete work. Three turbines of 52,500 hp. have already been installed; generator 1 is well on the way to completion, and generator 2 is set in place, but not yet wound. By Jan. 1, 1922, there will be in operation 100,000 hp.

There are now, and have been during the past winter, 7,200 men working on this job. To house the workmen it has been necessary for the Hydro-Electric Canal Commission to construct many buildings, as it is has been impossible to get adequate housing accommodations in the City of Niagara Falls, Ont.

A New Type of Benzene Still in European Operation

Descriptive Details of the Tubular Type Bamag Benzene Still—Tee Head Joints—Vapor and Condensate Countercurrent Flow Positive—Central Control
—Notes on Corrosion

By A. THAU

Superintendent of the Oxelösund's Iron Works, Sweden

DURING the war a new type of benzene still was brought out by the Bamag Co. of Cologne which was the result of many forerunners and while not free of faults, it can at least claim perfection in its line. The still consists of a number of horizontally arranged cylinder sections joined by flanged branches. A short description will be given and in order to make the somewhat complicated looking design readily comprehensible the rectifying sections in which no heating arrangements are provided will be described first.

RECTIFYING SECTIONS

Fig. 1 shows such a still section in vertical section, Fig. 2 the left head in line *AB* of Fig. 1 with its connections through which the vapors enter from below, while the condensed oil runs down from above through the upper branch. Fig. 3 shows a vertical section of the apparatus in line *CD* of Fig. 1, and Fig. 4 a section through the opposite head of the still section in line *EF* of Fig. 1 with the vapor outlet through the upper branch, while the condensate leaves through the lower branch.

The section consists mainly of a cylindrical, horizontally suspended tubular body *a* of 200 mm. internal diameter with flanges *b* on both ends. The tee heads enable a number of sections to be assembled into one still. The tubular body *a* in Fig. 1 is partly closed by

a cast-in partition *c*. This partition is grooved inside, projects into the head *d* and holds the wrought iron distributing pipe *f*, which is expanded into the socket *e* and passes through the entire length of the section, projecting a little into the opposite head *g*. The closed end distributing pipe *f* is bored with two rows of holes *h*. The construction of the head *d* can be seen upon inspection of Figs. 1 and 2. The condensate flows through the branch from above and is diverted upon reaching the cast partition *i* to both sides and conducted into the passage *k* under the socket *e*. In the lower half of the partition *c* a radial opening *l* is left as shown in Fig. 1 and conducts the condensate from below, thereby filling the whole section and sealing the openings of the vapor distributing pipe *f*. On the open end of the body *a*, opposite to the liquor entrance side, a vertical support *m* is fixed which holds the distributing pipe *f* rigidly and positively level. In the lower half of the head *g* the dam *n* is cast and cut to the height of the upper edges of the holes *h* in the vapor distributor *f*. In the opposite head *d* the dam *o* is higher than *h*. In the head *d* the partition *i* forms a closed annular space (Fig. 2) which is in direct connection with the distributor *f*, being open on this end, while the annular channel continues downward into the connecting branch *p*.

ROUTE OF VAPOR AND CONDENSATE

The vapors entering from the still section through the branch *p* are conducted through the channel formed by the partition *i* inside the end piece *d* and reach the distributor *f*. Equally distributed by the holes *h*, the vapor is forced through the liquid seal and enters the end piece *g*, from which it escapes through the connecting branch *q* and enters the next higher section, in which it repeats the operation. As indicated by the dotted lines in Fig. 1, representing joining sections, they are put together in the returning direction, so that piece *g* always goes on head *d*.

The condensed benzene entering the head *d* from above through the branch *r* circulates through the section as described before and increasing in volume by the addition of condensate, runs over the upper edge of the partition *n* and leaves the end piece *g* through the lower connecting branch *s*. The liquid enters the next section below through a head *d*.

By such means a positive and segregated countercurrent flow of liquid and vapor is obtained through the whole still. They pass separately through the connecting heads and are in contact only when inside the sections. The cylindrical bodies of these sections between the flanges *b* are thickly insulated to prevent too rapid condensation.

The distilling sections in which heat is introduced

FIGS. 1 TO 4

Fig. 1—Longitudinal section of rectification section. Fig. 2—Vertical section through Fig. 1 at *AB*. Fig. 3—Vertical section through Fig. 1 at *CD*. Fig. 4—Vertical section through Fig. 1 at *EF*.

by indirect steam resemble those just described very much and the action set up in them is decidedly the same. The difference is in the use of three heating elements in each section, which results in a greater internal diameter of the cylindrical bodies. Fig. 5 shows a longitudinal section through a still section, Fig. 6 a cross-section through the right head of Fig. 5 in line *AB* and Fig. 7 shows in the left half an outside view of the left head of Fig. 5 and to the right a cross-section through this head in line *CD* of Fig. 5.

In these sections the vapor-distributing pipe *a* is of cast iron and has two rows of equally spaced 1-in. holes.

FIGS. 5 TO 7

Fig. 5—Longitudinal section of distilling section. Fig. 6.—Vertical section through Fig. 5 at *AB*. Fig. 7—Vertical section through Fig. 5 at *CD*.

The distributing pipe *a* is fastened at the entrance end of the vapors by the bolt *c* and supported in the socket *d* by means of asbestos packing. At the opposite end the distributor *a* is closed by a cast-iron plug *e* calked in with lead packing. The plug *e* holds a bolt *f* projecting through the hole *g* giving support to the distributor *a* and holding it level. Below the distributor *a* three heating elements are arranged in the distilling sections. The two heating elements *h* introduced from the left-hand side in Fig. 5 occupy the space below the pipe *a*, while the third, *i*, being introduced from the other end, is located immediately under the distributor *a* in the section between the other heating elements. These elements consist of tubular castings strengthened by side ribs and the steam passage through the elements is shaped like a U-tube. As will be seen from Figs. 6 and 7, the elements *h* on both sides are provided with three ribs, and *i* with four. The heating elements have a circular flange *k* which is drawn tight by bolts. The flanges are machined on both sides. The connections are so arranged that the upper openings of each element are connected to the high-pressure steam supply, the lower ones to a common pipe leading to a steam trap. The ends of the heating elements opposite the flange lids *k* are provided with a flat nose piece *m* reaching into a fork *n* cast into the branch lids of the sections. The heating elements are supported by these on both

ends. The nose piece *m* is somewhat shorter than the fork *n*, allowing for expansion of the elements.

OIL CIRCUIT

The oil entering from above passes through the branch *o* exactly as shown in the rectifying sections without heaters (Figs. 1 and 2) and is diverted by the partition *p* to both sides and enters the section through the two openings *q*, one of which is indicated on the left side of Fig. 7. The oil passes through the section, which is filled so that the holes *b* of the vapor distributor *a* are completely immersed in accordance with the level of the dam *r*. The surplus oil runs over the top edge of the dam on the heating element *i* (as far as this crosses the passage in the branch lid) and leaves the section through the passage in the head *s* to the next section. The vapors enter from below through *t*, pass through the annular space formed under the partition *p*, which is in direct connection with the open end of the vapor distributor *a*. They are then bubbled through the hot oil covering the ports *b*. The vapors pass upward through *u* to the next section, through which they are conducted in the same fashion. To obtain the zigzag passage of oil and vapor through the assembled units, it is necessary to connect the adjoining sections in opposite directions to Fig. 5—that is to say, if the letters marking the four connecting branches in Fig. 5 are applied to all the sections of which a still is composed, then the following combinations are observed: *ut*, *os*, *tu*, and *so*.

To drain these sections in case of repairs the head through which the heating element *i* is introduced is provided with the drain valve *v*. A hole *w* is drilled immediately above the bottom of the dam, which is closed by the valve. By opening it the section is drained completely, and the oil runs out through the opening *w*. The holes *x* are drilled through to drain the distributor dry when emptying the section. The cylindrical part of the sections is insulated and covered by sheet iron, giving the still a pleasing appearance.

THE ASSEMBLED STILL

The arrangement of a benzene plant in which continuous distillation of the crude products is effected in three such stills is shown in Fig. 8 in front view, while in Figs. 9 and 10 the stills are shown in side view, Fig. 9 in line *AB* and Fig. 10 in line *CD* of Fig. 8.

A strong concrete foundation supports two vertical frames *a* of steel construction. They are provided with cross beams *b* by which the weight of the stills is partly taken up by means of suspension bolts. The diagonally strengthened frames *a*, which are somewhat higher than the stills, hold the preheaters, dephlegmators and a platform with stairs.

A light-oil still *c* of normal capacity consists of seven cylinder sections each of about 2,700 mm. length and 600 mm. outer diameter. The sections are flanged together at the heads. The three heating elements of each section are supplied with high-pressure steam from the two common pipes *e*, while the two common pipes *f*, being connected to a steam trap *g*, drain the condensed water. The third steam pipe *h* running parallel to *e* and *f* conducts the steam to the heating elements of the oil preheater *i* on top of the platform. The enriched wash oil, which arrives somewhat preheated, having passed through heat exchangers in which it has taken up part of the heat of the light-oil vapors and of the spent oil

leaving the still, enters the preheater *i* through the pipe *j* and leaves it through the pipe *k* to enter the still *c*. It is admitted in the top section on the front, circulates through it toward the back, runs into the next lower section, through which it passes in the opposite direction, and so forth through the whole still, leaving the bottom section through a branch under the back side provided with a siphon.

DESCRIPTION OF OPERATION

The light-oil vapors leave the section through the head on the back side and enter the next section, which they leave through the head on the front side, and so forth through the whole still. From the head on the back side of the top section the vapors are conducted through the pipe *l* into the dephlegmator *m* and leaving the latter on the top are brought to a condenser. The pipe *l* is connected with the top of the preheater *i* by means of a pipe bent to so high a pitch that no oil can pass that way and only the vapors which are given off in the preheater are conducted direct into the dephlegmator.

The light oil produced in the still *c* is collected in a receiver and pumped to a tank sufficiently high to supply the preheater *n* by gravity. The preheated light oil is conducted through the pipe *o* into the top section

FIG. 8. FRONT VIEW OF ASSEMBLED STILL

of the still *p*, which, consisting of three distilling and six rectifying sections *r*, drives off the crude 90 per cent benzene. The still *q* is immediately under the still *p* and consists of two sections in which the products with a higher boiling point than benzene are driven off in one single fraction called crude naphtha.

The individual sections in the three stills *c*, *p* and *q* are of identical design. The preheated light oil fed into the still *p* through the pipe *o* circulates through the upper distilling section from front to back, through

the second from back to front and through the third and last again from front to back, where the rest arrives free from benzene. It passes now through a siphon pipe *s* and enters the upper of the two sections of the naphtha still *q*. The residue leaving the lower section of the still *q* consists of wash oil holding naphthalene in solution and is conducted through a steam-

FIGS. 9 AND 10.

Fig. 9. (left)—Side view showing preheater. Fig. 10 (right)—Side view showing naphtha still and dephlegmator.

heated pipe siphon to crystallizing pans, where the naphthalene solidifies, while the wash oil can be decanted off and brought back into the wash oil circuit.

The benzene vapors leaving the upper distilling section of the still *p* enter the rectifying sections *r* on top, which are in immediate connection with the still *p*. The surplus benzene condensed in the section *r* flows from the lowest section into a T-piece built into the light-oil feed pipe *o*, so that light oil and condensed benzene enter the still *p* together. The vapors leaving the upper section *r* are conducted through the water dephlegmator *t* of usual design with vertical water-cooled tubes. The vapors enter the dephlegmator from above and a pipe bent to a U is connected between the vapor pipe and the light-oil preheater *n* to conduct the vapors developed in the preheater direct into the dephlegmator *t*. Under the bottom of the dephlegmator a catch box is provided which conducts the condensed benzene from the dephlegmator through a siphon pipe back into the upper section of the rectifying still *r*. The vapors leaving the dephlegmator *t* are brought to a condenser of usual design.

The vapors driven off in the naphtha still *q* are conducted through the pipe *u* into the dephlegmator *v*, into

which they are admitted through a branch connection in the bottom. Leaving at the top, the vapors enter the small water dephlegmator *w* arranged immediately above the former. The vapors leaving the latter through a branch in the lid are conducted to a condenser of usual design. The naphtha condensed in the dephlegmators *w* and *v* runs to the bottom of the latter and collects in a catch box which is connected by means of a pipe to the siphon pipe *s* and thus enters again the section *q* of the naphtha still.

It will be quite clear now that the stills *q* and *p*, although arranged in one vertical line, are two independent units, the still *q* receiving the residue from the still *p* by means of an interconnected siphon *s*. Continuous benzene distilling is obtained in one process up to the point where the products must be washed. Two fractions are continuously produced—viz., 90 per cent crude benzene and crude naphtha, of which the latter must be separated in the desired fractions during the final distillation after washing.

NAPHTHA STILL

The lowest section of the stills *c*, *p*, and *q* differs from those described in Figs. 5 and 6 in that no vapor-distributing pipe is provided. This is not required, as no vapors enter the bottom sections in which the last traces of benzene are driven out. There are also only two heating elements in these sections and in place of the middle one a perforated steam pipe is introduced into the section resting on its bottom over the whole length. Through this a small amount of direct steam is admitted to the still—just enough to start and accelerate distillation. The three bottom sections *c*, *p* and *q* are also provided with glass gages to observe the liquor level inside, as indicated in the side views, Figs. 9 and 10.

The rectifying still *x* suspended from the platform and the water dephlegmator *y* on top shown to the extreme right in Fig. 8 form a quite independent unit from the apparatus so far described. They are of identical dimensions and construction as the unit *r* and *t* and are connected to the intermittently working finishing still for the treatment of the washed products. This still is of the usual design and thus not included in the figures.

The large dephlegmator *m* of the light-oil still *c* and the one *v* of the naphtha still *q* are hollow cylinders filled with wrought-iron cylindrical rings.

CENTRAL CONTROL BOARD

To control these stills the bottom section is provided with a gage glass to show the liquid level. The steam valves and pressure gages for each still are united on a control board, of which the one serving the crude benzene and the naphtha still at the same time is shown in front and side views in Fig. 4. The gage board is placed and fixed in front of the still and consists of lacquered sheet iron mounted on an iron frame and bent over to a right angle on both sides. Behind this plate the steam pipe entering with a main valve *a* is divided into several branches. By means of a separate branch with valve *b* steam is admitted to the heating elements of the benzene still. The pressure thereby applied to the elements is indicated by the high-pressure steam gage *c*. Through the valve *d* direct steam is introduced into the bottom section of the benzene still, the pressure thereby created in the section being indicated on the low-pressure gage *e*. The steam to the heating elements

of the naphtha still is admitted through the valve *f*, the pressure indicated by the high-pressure gage *g*. Direct steam is introduced into the lowest section of the naphtha still by means of the valve *h* and the pressure created therein is indicated by the low-pressure gage *i*. The valve *k* admits the steam to the light-oil preheater and its steam pressure is shown on the high-pressure gage *l*.

As indicated in Fig. 11, near every valve and gage an enameled plate is fixed labeling its purpose. The writer suggests in order to enlarge these very useful control boards that the thermometer dials belonging to the particular apparatus be installed on the same

FIG. 11. CONTROL BOARD

board, which by using mercury steel tube thermometers with flexible connections between dial and mercury bulb does not present any difficulties. The control board should be provided with a thermometer showing the temperature of the steam, which, in connection with light-oil stills, is of great importance to keep the spent oil free of water on leaving the still.

The advantage of these latest designs of benzene stills is in the high efficiency reached. They have been working over a year, have not given cause for complaints and their steam consumption is relatively low. The distilling effect is mainly obtained by large indirectly heated surfaces over which the liquid is forced to travel almost continuously on its way through the stills. The amount of direct steam used is comparatively very small and in the case of light-oil stills the spent oil is kept free from water without the least difficulty.

CAST-IRON CONSTRUCTION

Before concluding, a few words should be included on the material employed in benzene stills. For the stills themselves, cast iron must invariably be used and although with steam coils bent from seamless steel tubing a much better heating effect is obtained than with cast-iron elements or cells, the latter are to be given preference, or frequent stoppages and renewals are encountered. Wrought iron is strongly attacked and

blank flange of 2.5 mm. thickness which the writer applied on the outside of a still was eaten through completely within ten days when the oil leaked out. For the same reason oil preheaters with steel tubes lead to continuous repairs. Two attacking agents are ammonia and cyanides, though of the former only traces should be found in the gas after it has passed the saturators. Ammonia and cyanogen are not easily absorbed by the wash oil, but the latter contains a sufficient quantity of water to saturate them and cause trouble. Ammonia and cyanogen are completely volatilized if the temperature is maintained sufficiently high and the corroding effect of the oil in the still, into which no ammonia or cyanides should be carried over, has for a long time remained a mystery.

CORROSION DUE TO ORGANIC SULPHUR

Quite recently, however, the results of the research of Dr. Weissgerber¹ show that the corroding effect of tar oils on wrought-iron tanks, etc., must be attributed to organic sulphur compounds in the oil, and especially in naphthalene oil. These observations are confirmed by the experience of the writer, who found the corroding effect of the wash oil in the still more pronounced the higher the contents of naphthalene were. It would mean a deviation from the present subject to dwell further upon these interesting investigations, and the conclusion must be drawn that a departure from cast iron in the construction of preheaters and distilling sections in preference to other metals is to be avoided, or heavy and frequent repairs must be reckoned with after a time.

Preliminary Reports of 1919 Census of Manufactures—Sugar and Glass

Preliminary statements of the general results of the 1919 census of manufactures with reference to beet sugar, cane sugar and glass have been issued by the Bureau of the Census. The statistics for 1919 and 1914 are summarized in the following tables, prepared under the direction of Eugene F. Hartley, chief statistician for manufactures. These figures are subject to such change and correction as may be necessary from further examination of the original reports.

BEET SUGAR INDUSTRY

Reports were received from 85 establishments engaged in the manufacture of beet sugar in 1919 and

their products for the year were valued at \$149,155,892. At the census of 1914 there were 60 establishments with products valued at \$62,605,210. The value of products therefore has been increased \$86,550,682, or 138.2 per cent.

In 1919 there were 16 establishments each in Michigan and Utah, 14 in Colorado, 10 in California, 8 in Idaho, 5 in Ohio, 4 each in Nebraska and Wisconsin, and 1 each in Illinois, Indiana, Iowa, Kansas, Minnesota, Montana, Washington and Wyoming.

CANE SUGAR INDUSTRY

Reports were received from 202 establishments in 1919 engaged principally in the manufacture of cane sugar. The products for the year were valued at \$57,741,320. At the census of 1914 reports were received from 181 establishments with products valued

Legal Notes

BY WELLINGTON GUSTIN

Grosvenor Process for Hardening Siccative Coatings Held Invention

The United States District Court upholds the validity of the William M. Grosvenor patent, No. 1,186,477, claims 2 and 4, for a process for drying and hardening siccative coatings, in a suit by the Wenborne-Karpen Dryer Co. against the Rockford Bookcase Co.

Siccative coatings are said to be such as varnish, oil paints and oil-containing fillers which harden by oxidization. It was pointed out that hardening of paint was oxidization—a chemical action—while drying or evaporation of water is a physical process. Grosvenor's process was intended to harden the coatings rapidly and to produce them superior to those treated by other processes. It was not claimed to be new in the arts. In its simplest form it consists of simultaneously adding heat and moisture to the air surrounding the siccative coatings. Such a process has been used for years in drying lumber. It was learned early that if lumber were subjected to artificial heat it would dry rapidly, but the outside would become case-hardened. Steam vapor was therefore introduced into the drying chamber simultaneously with the heat circulation procured by fans, etc., and in that way the outside drying was retarded until the inside drying caught up, and the whole dried thoroughly and evenly.

A QUESTION OF PATENTABILITY

The only question, said the court, was whether the old lumber dry-kiln methods, when applied to harden siccative coatings, was patentable. (269 Fed., 144).

It was shown that prior to the Grosvenor process it required from eighteen to forty-eight hours to harden thick varnish, whereas under the new process the same result was reached in from six to eight hours. The so-called drying of paints and varnishes is not the same as evaporating moisture from wood or other products, nor does the use of the earlier lumber dry-kiln process even suggest that it might be used to dry paints, said the court. For years it was thought the introduction of moisture would delay hardening and water was generally kept away from fresh paints. The court held that the old and well-known process referred to was not only applied in a different art, but with a new and different result.

It required genius to discover, thought the court, by experimentation or otherwise, that the old process was suitable for the new use, and would produce a beneficial result therefrom unforeseen. It is apparent that the suitable hardening by oxidization of substances like a siccative film was not suggested by the drying of substances like a porous block of wood; because before the Grosvenor process it was the consensus that moisture was one of the greatest obstacles to the rapid drying of varnish, observed the court.

NO ANTICIPATION, DECIDES COURT

The second defense to the suit was anticipation by patents in the prior art, along with a published article, entitled "Pigments, Paints and Painting," written by

George Terry in 1893, where the author says: "The drying of paint being a process of oxidization and not evaporation, it is essential that a good supply of fresh air should be provided," adding that the presence of moisture in the air was beneficial and tends to counteract the tendency of the paint to crack or shrink. But Terry not only failed to indicate that moisture increased the rate of drying; he made no suggestion of any advantage to be secured by the rapid circulation of currents of air or other oxidizing agents across the surface of the material. Terry at best only anticipated the drying of paint under the action of heat, fresh air and whatever moisture nature happens to give in the air.

Grosvenor took a decided and important step in advance, said the court. His process cuts down the time of drying one-half, and in that way saved huge sums tied up in time and space in the manufacture of articles requiring such coatings. No prior reference or patent points out that the use of moisture in excess of natural humidity would be of any value, if indeed it was not said to be a disadvantage.

The patent was held valid and the usual reference was made for an accounting on the part of defendant.

Crop Surplus Awarded Fertilizer Works Where Surplus Was Due to Fertilizer Used

In a lien creditor's suit by the Armour Fertilizer Works against John W. Taylor and others, the Supreme Court of Appeals of Virginia reversed the lower court and directed that the fund in controversy be paid over to the fertilizer works. Taylor owned valuable farm lands which were heavily encumbered by many deeds of trust and judgments. To enforce these liens a lien creditors' suit was instituted. Later the several tenants who had leased the lands from Taylor purchased fertilizers from the Armour Fertilizer Works for use in making crops, giving their notes for the fertilizers purchased, securing the notes by crop liens duly executed under the Virginia statute.

A sale was had of the lands under direction of the court, under a decree in the lien creditors' suit. After payment of the old liens there was a balance left, applicable to either the crop lien claim or to payment to the trustee in bankruptcy for distribution among general creditors of Taylor who had become bankrupt. On Armour's crop lien claim it was found that the proceeds of the sale of the lands were augmented by the value of the crops, and that such crop value was due to the known and recognized effects of the fertilizer, which had been obtained upon by the security afforded by the crop liens. In other words, the court said the crop liens must be regarded as having produced the surplus.

DECISION SETS A PRECEDENT

The law is that where crops are planted after a mortgage is given on lands the crops pass with the lands for the benefit of the mortgagee, whether planted by the mortgagor or his tenant. No authority was found on the point involved, and the court was forced to proceed on equitable principles. It said the fund in controversy and claimed by the fertilizer works under its crop lien was in existence as a direct result of the sale of fertilizers to the tenants of the landlord, who had agreed or should have agreed in equity and good conscience for that fund to go to the seller of the fertilizer. The trial court's holding that the surplus belonged to Taylor's creditors was therefore reversed and the amount awarded to the fertilizer works.

Gases in Aluminum Furnaces and Their Analysis

**A Number of Common Gases Are Mixed in the Atmosphere of Various Furnaces Melting Aluminum—
The Problem Is to Develop a Portable Gas-Sampling Apparatus Which Will Extract
a Portion From a Desired Spot and Store It for Analysis**

BY ROBERT J. ANDERSON AND J. H. CAPPS

NO SYSTEMATIC studies of the actual constitution of the gas atmospheres prevailing in the interior of industrial metallurgical melting furnaces have been made. The constitution of flue gases in boiler-room practice and in coal-fired furnaces has been examined exhaustively by Kreisinger¹ and others, and is of interest and importance in connection with coal-fired metallurgical furnaces, since many gas analyses are given of the atmospheres obtaining in the fuel bed and in the combustion space.

LITTLE KNOWN ABOUT FURNACE ATMOSPHERES

As to the constitution of the gas atmospheres in the interior of metal-melting furnaces, the available data are very meager. In the publication of the Bureau of Mines on brass-furnace practice,² some analyses of the waste gases from a gas-fired, pit-crucible furnace are reported. The results of these analyses indicated the presence of a slight trace of carbon monoxide, never exceeding 0.40 per cent, and the proper proportions of nitrogen and carbon dioxide, indicating good combustion. Just recently, Bamford and Ballard³ have reported the sampling of gases from points near the top of a coke-fired pit-crucible furnace. In all cases the gases over the crucible contained an excess of oxygen and also small quantities of carbon monoxide ranging from 0.50 to 0.90 per cent. In one case, where the fire had burned down badly, 1.30 per cent hydrogen was found. In no case was there more than a trace of sulphur dioxide, but this is stated to be a condition dependent upon the character of the coke used, since when the coke contains any sulphur the combustion products must show the presence of sulphur dioxide.

It will be plainly evident that the constitution of the gas atmospheres in most industrial melting furnaces will be dependent upon a number of governing factors. The most important of these are the following: (1) Kind and quality of the fuel used; (2) type and design of the furnace; and (3) operating conditions.

KINDS OF FURNACES USED IN ALUMINUM MELTING

In large foundries, the stationary and tilting iron-pot furnaces appear to be favored considerably, but the tilting open-flame furnaces are also used a good deal. In small foundries, pit furnaces, using a plumbago crucible for both melting and pouring, are still employed

quite largely. Electric furnaces for melting aluminum and its light alloys are just now receiving considerable attention, and a few installations have been made. In the case of melting and smelting furnaces for aluminum and light aluminum-alloy borings, scrap and drosses, the domestic practice is not standardized. For smelting borings and other light scrap for the production of so-called "casting aluminum," stationary iron-pot furnaces, reverberatory furnaces, pit furnaces and tilting, open-flame furnaces are employed commercially. Experiments have also been made on the electric smelting of these materials.⁴ More recently a number of companies have made preliminary studies of the electric smelting of light aluminum-alloy borings, but no electric furnace is operating commercially on such material at the present time.

CONSTITUENTS OF MELTING-FURNACE ATMOSPHERES

It will be shown in a later contribution by detailed lists of analyses that the constituents which may be present in various furnace atmospheres vary widely as to kind and amount.

Carbon dioxide is a frequent constituent in the atmospheres of practically all types of furnaces used in the commercial melting of aluminum and its light alloys. The complete combustion of fuel results in the conversion of all the carbon, in whatever form, to carbon dioxide.

Carbon monoxide is a frequent constituent of melting-furnace atmospheres. In certain types of furnaces, it is normally present in small percentages under ordinary operating conditions, but the amount contained in the atmosphere can be varied within wide limits by varying the method of firing. A high carbon-monoxide atmosphere is normal in most electric furnaces.

Free cyanogen is of comparatively rare occurrence in furnace atmospheres used for melting aluminum and its light alloys. Cyanogen is formed in small amount when a discharge of electricity takes place between carbon electrodes in the presence of nitrogen. Thus, cyanogen is normally present in small amount in arc-type electric furnaces.

Hydrogen is normally regarded as a reducing gas; it is a frequent constituent in fuel-fired furnace atmospheres in small but variable amounts, and it has also been found in the atmospheres of electric furnaces. The presence of hydrogen in a fuel-fired furnace atmosphere normally indicates incomplete combustion, since the combined or free hydrogen in a fuel should burn to water.

Methane, in small but appreciable amounts, occurs in the atmospheres of furnaces fired by methane-containing fuel, due to incomplete combustion. It can scarcely

⁵Gillett, H. W., and James, G. M., Melting Aluminum Chips, Bureau of Mines Bull. 108, August, 1916.

be doubted that no methane is formed by the direct union of carbon and hydrogen. The occurrence of free methane in a furnace atmosphere indicates incomplete combustion, since methane burns to carbon dioxide and water in air.

Nitrogen is a normal constituent of all furnace atmospheres, being derived from the air. It is, of course, evident that nitrogen will always constitute a large percentage of the atmosphere in any fuel-fired furnace, since air is required for combustion.

Free, uncombined oxygen may be present in varying amounts in the atmospheres of industrial melting furnaces operating on aluminum and its light alloys. Ordinarily, free oxygen is the result of a large excess air supply, but it is possible that considerable carbon monoxide may be present in furnace gases together with some oxygen. This condition is stated by Gillett⁵ to be common in industrial melting furnaces when the attempt is made to avoid an oxidizing flame. At the same time, free oxygen is normally present in open-flame furnaces when run with an excess air supply; here, both oxygen and carbon dioxide may be present in large percentages, together with nitrogen and other gases. As in the case of other constituents of furnace atmospheres, the oxygen percentage depends upon the type of furnace, upon the fuel used and upon the operating conditions.

Sulphur dioxide may be present in furnace atmospheres in appreciable amounts when high-sulphur fuel is used. It results from the combustion of the sulphur in fuels, and at least small amounts occur normally in furnace atmospheres.

Unsaturated hydrocarbons in a furnace atmosphere normally come from the fuel used and are the result of incomplete combustion. The percentages present in various furnace atmospheres are usually quite low. No examination of the effects of unsaturated hydrocarbons upon the properties of aluminum and its light alloys has been made so far as is known.

Water vapor is a constituent of many furnace atmospheres, and it results from the combustion of free or combined hydrogen. The amount of water vapor in an atmosphere at high temperature is not readily determinable quantitatively, since the water vapor condenses on exposure to temperatures below 100 deg. C. From the chemical analysis of the fuel used, it is possible, however, to gain an idea of the amount of water vapor produced on combustion.

PORTABLE SAMPLING APPARATUS

In view of the influence which correct atmosphere control undoubtedly has upon melting losses, the Bureau of Mines resolved to make an effort to supplement the meager data now available on the composition of furnace atmospheres.

Most of the furnaces from which the gas samples were taken were located in plants several hundred miles from the Pittsburgh station of the Bureau of Mines. Hence it was necessary to devise a portable sampling apparatus for taking the gas samples. The apparatus described below has proved to be entirely satisfactory for the authors' purpose, and it is believed that the method of drawing off the gases by means of the mercury "pump" will be found preferable to any aspirating device. The apparatus as devised can be readily packed in a small box for shipment, and it can be carried about

in the plant for set up at a given furnace. The gas samples collected from furnaces at different plants throughout the country were contained in heavy glass bottles fitted with a spring cork and a rubber gasket. They were packed in excelsior at the plant where the samples were taken and shipped to the gas laboratory at the Pittsburgh station for analysis.

The portable sampling apparatus used for the removal of samples from furnace atmospheres is shown in Fig. 1. Tube *a* is attached to a fused silica tube, 4 ft. long, $\frac{1}{4}$ in. internal diameter and $\frac{3}{8}$ in. external diameter which is placed in the furnace so that gases may be drawn through it. Part *b* is a rubber tube, of the heavy-walled pressure type. A 20-ft. length is sufficient for most conditions met with in furnace installation. Part *c* is a glass bulb of about 100 c.c. capacity mounted upon a support.

SAMPLING PROCEDURE

In collecting the gas samples from the atmospheres of the various furnaces, the method for drawing off and holding the gas was the same throughout. The detailed method for obtaining a gas sample is as follows: The

FIG. 1. PORTABLE DEVICE FOR SAMPLING FURNACE ATMOSPHERES

sample bottle *g* is filled with mercury and sealed with the rubber spring stopper; it is then inverted in the ring stand *h* into the dish *f*, which contains sufficient mercury to seal the mouth of the bottle when the stopper is opened. Bulbs *c* and *d* contain mercury in the amounts indicated in Fig. 1—i.e., when the mercury in both bulbs is at the same level the bulbs are each about half full. The actual amount of mercury required for manipulation depends upon the size of the bulbs and the connecting tube. With the sampling tube placed in position in the furnace atmosphere to be sampled, pinch cock *j* is opened and the delivery tube *e* is placed in such a position that it may exhaust gas into the mercury in the dish *f* but not into the bottle *g*, which is not opened until the apparatus is thoroughly "washed."

Bulb *d* is now lowered, the falling mercury in *c* causing gas to be drawn from the furnace through *a* and *b* and into *c*. The tube *b* is then closed by the pinch cock *j*, thus preventing the egress of gas through that line on raising *d*. When *d* is now raised, the mercury rising in *c* expels the gas, drawn into *c*, through *e*, through the

⁵Gillett, H. W., *Brass-Furnace Practice in the United States*, Bureau of Mines Bull. 73, second ed., June, 1916, p. 214.

mercury, and into the air. The apparatus is washed through with furnace gas from six to fifteen times before admitting gas to the sample bottle. When ready to deliver gas to the sample bottle, assuming that a quantity of gas is inclosed in *c*, the sample bottle is uncorked under the mercury in dish *f*; the end of the delivery tube *e* is inserted into the neck of *g*, and by raising the bulb *d* (*j* being closed), gas is delivered to the bottle. Then *b* is opened at *j*, and the operation is repeated until the sample bottle is full of gas, the mercury having been displaced and discharged into the dish *f*. The mercury in *f* acts also as a seal for *e*, thereby preventing ingress of air when *j* is opened and *d* is lowered.

As indicated, the "pump" is operated until the sample bottle is full, after which the bottle is sealed with the stopper, still under the mercury, removed, labeled, and its whole neck with stopper dipped in liquid paraffine to insure an air-tight seal. With this apparatus, samples can be taken at the rate of one every four or five minutes. Changes in the composition of a furnace atmosphere and variations in furnace operation can thus be detected during the course of a complete melting period.

In general, the open end of the sampling tube was placed in a position at about the center of the interior of the furnace and very near the surface of the liquid melt, say $\frac{1}{2}$ to 1 in. from the surface. In all cases the aim was to secure samples of the gas in contact with the alloy. For open-flame tilting furnaces, and in some closed furnaces, the sampling tube was admitted into the interior of the furnace through a hole in the door or through the pouring spout and luted firmly with clay. The intention for all furnaces was to bring the intake end of the tube to a position in about the center of the furnace and very near to the surface of the liquid alloy. This was not possible in the rocking-type indirect-arc electric furnace, nor in other furnaces under some conditions—such as in the early stages of a melt when the interior was filled with bulky scrap. In such cases the sampling tube reached well into the furnace, although not to the center. For open iron-pot furnaces and crucible furnaces, the sampling tube was simply supported by a stand in such a way that the intake end reached to within about one inch of the bath near the center.

GAS ANALYTICAL METHODS

In the analysis of the various gas samples a Bureau of Mines modified Orsat apparatus was used. Detailed description of the apparatus or of the methods employed for the determination of the constituents of the samples is not necessary here, since these subjects have been treated fully in other publications⁶ of the Bureau of Mines. Briefly, the different constituents in the gas samples are determined as follows: Carbon dioxide is determined by absorption in potassium hydroxide, oxygen by potassium pyrogallate solution, and unsaturated hydrocarbons by fuming sulphuric acid. Hydrogen and carbon monoxide are determined by the copper-oxide combustion method and saturated hydrocarbons by slow combustion. Cyanogen is determined by absorption in 2.0 per cent sodium bicarbonate solution and titration with standard iodine.

Growth of the American Sulphur Industry

During the year 1910 crude sulphur imports into the United States totaled 28,648 long tons, valued at \$495,988, or an average of \$17 per ton. These figures were closely related to the domestic exports of brimstone and other refined forms, amounting to 30,742 tons, invoiced at \$552,941, an average export price of \$18 per ton.

For the calendar year 1920 imports were only 44 tons, valued at \$1,722. The domestic exports of sulphur amounted to 477,450 tons, worth \$8,994,350. From 1880 to 1903, the average annual importation was approximately 100,000 tons. Since 1907, annual imports have never gone above 30,000 tons. The average was about 20,000 tons. Receipts have been considerably lower since 1917.

Domestic sulphur was originally exported in 1904. In 1907, for the first time exports exceeded imports. From 1906 to 1911, about 30,000 tons was exported annually, increasing more than fifteen times, to 477,450 tons, in 1920.

The decline of imports followed the development of the Louisiana deposit, the first to be discovered in the United States. According to the United States Geological Survey, early attempts to mine the Louisiana deposits were unsuccessful, until the double problem of reaching the deposit and extracting the sulphur was solved by Dr. Herman Frasch. The original Frasch patents having expired, the same general process is now in use, both at the original locality and at Freeport, Tex., the next most important center. The United States Geological Survey has more recently investigated additional sulphur deposits in New Mexico and Alaska.

Exports in 1916 exceeded imports by 107,000 tons and were valued at over \$2,500,000. They showed increased valuation for each year thereafter. The annual growth in the export trade and the corresponding decline in imports during the past eleven years is shown in the following table, compiled from statistics from the Bureau of Foreign and Domestic Commerce:

EXPORTS AND IMPORTS OF SULPHUR 1910-1920

	Exports		Imports	
	Tons	Value	Tons	Value
1910.....	30,742	\$552,941	28,647	\$495,988
1911.....	28,103	545,420	24,250	436,725
1912.....	57,736	1,076,414	26,885	494,778
1913.....	89,221	1,599,761	14,636	278,56

French Steel Companies Combine

Through the office of the commercial attaché at Paris it is learned that three of the largest steel corporations in France have recently combined. The principal company of the new combine is the Société Anonyme des Forges et Aciéries du Nord et de l'Est, the capital of which is to be increased from 46,000,000 to 86,000,000f. It will absorb the holdings of the Société des Forges et Aciéries du Nord et de Lorraine and of the Usines Métallurgique de la Basse-Loire. It is stated that the new company will control an ore domain with equipment for an annual production of 4,000,000 tons, and also six large French coal companies and important coal deposits in England as well as coke, cement and building material companies, rolling mills, foundries and casting plants.

Some Chemical Considerations of Petroleum Refining*

Factors Influencing a Change in Attitude of Petroleum Refiners Toward Chemical Research and Development of Non-Benzenoid Hydrocarbon Chemistry—Unsaturated Hydrocarbons Misunderstood—Polymerization Phenomenon Should Be Studied

By BENJAMIN T. BROOKS

PROF. IRVING FISHER in outlining his analysis of reconstruction problems has made use of the headings, "1. What is it? 2. Why is it? 3. What of it? 4. What are you going to do about it?" and it seems to me these questions may well be asked in discussing the chemical aspects of petroleum refining.

One might seriously debate the question whether or not there is such a thing as the chemical technology of petroleum. As to whether or not there *may* be a chemical technology of petroleum is another question, and I believe that this possibility is one of the best reasons for the formation of a petroleum section of the American Chemical Society. It is not the purpose of this discussion to quibble over definitions, but I believe that most of us will agree that while we have a more or less specialized technology of petroleum, chemistry has thus far played a relatively unimportant part in this industry. Many of us believe that chemistry should have played a much more important part in the technology of petroleum and the utilization of its products than it has done in the past, and that it is destined to do so. Let us attempt to analyze this situation and find out the reasons why.

Petroleum has been plentiful and it has until quite recently yielded handsome profits when simply burned as fuel. Greases and lubricants at least as good as anything to which the public was accustomed were easily made; not much chemistry required here. Petroleum has been so plentiful that refiners have often been hard pressed to take care of it; "throughput" has been the first consideration and only the simplest refining operations were permitted.

Research has been regarded as a kind of "wildcatting" in which the chances of success were not very good, the objectives often hazy and indefinite and not well understood; the gulf between scientific men and "practical oil men" has been very wide indeed. Burton's cracking process is the one important exception of a process having been originated and developed entirely by the works. This process and its demonstrated success is the best sign that the character of works management is changing. The Gulf Refining Co. has maintained a small research organization in the Mellon Institute for several years.

Work that has been done by chemists in the employ of oil companies has usually been buried, owing to the supposed value of secrecy and to the inertia of conservative oil producers of the old school. No one knows how much valuable work has been done and practically lost or buried in this way. Under these conditions initiative and the incentive to investigation are killed.

There exists no journal or publication which is recognized as serving the interests of petroleum technology, with the result that such few matters as are published

are scattered in a number of publications of indefinite or heterogeneous character. Petroleum investigations published in this way get lost in the shuffle and their message does not "get across." At present chemists interested in petroleum research are inarticulate.

There is a broad gap between petroleum technology and theoretical organic chemistry, and in this connection it should be emphasized that comparatively little systematic work in the chemistry of the non-benzenoid hydrocarbons which should serve as the fundamental groundwork of petroleum investigations has been done. Easily 80 per cent of the work which has been done must be credited to Russian chemists.

Poor training and narrowness of chemists; a chemist must be vastly more than an analyst to be of great service in this or in fact any industry.

FACTORS INFLUENCING A CHANGE

Let us see if there are any factors now operating which may change this state of affairs. I believe the following are likely to prove important.

Compared with demand, petroleum is much less plentiful than in former years. Its use as fuel has already ceased in many localities, and the cost of gas oil, for the manufacture of carburetted water gas, has become almost prohibitive.

Greater flexibility in refining operations is demanded so as to increase the production of the more valuable products.

The quantity of high-grade crudes, such as that of Pennsylvania, is relatively much less than ever before and it is far more difficult to manufacture products of satisfactory quality from oils such as Mexican or Californian oil.

The large refining losses resulting from treatment of highly unsaturated oils, together with the general economic situation, alluded to above, makes a study of refining, with the object of eliminating or minimizing these losses, almost imperative. Pyrolysis of oils as in the Burton process is now an indispensable process; shale oils and oils from the low-temperature carbonization of coal are on the way and the losses resulting on refining such oils by ordinary methods are very large indeed. In spite of the many years of oil-shale practice in Scotland, the losses on refining are enormous, and it may be said that no satisfactory method of treating these oils exists today.

The reaction of the automobile industry on the petroleum industry has been to emphasize the need of getting down to bed rock fundamentals, particularly as regards motor fuels, lubrication and the study of lubricating oils, their refining, carbonization, air oxidation, etc.

Following the lead of the Russians in the application of scientific research to petroleum, the Anglo Persian Oil Co. has established a large research laboratory in

*Read before the Petroleum Section of the American Chemical Society, Rochester, N. Y., April 27, 1921.

England under the direction of an able theoretical chemist, Dr. Dunstan. American petroleum interests probably will follow these leads. The American Petroleum Institute will undoubtedly be strongly influential in bringing this about.

NON-BENZENOID HYDROCARBON RESEARCH

A larger number of men, well trained in chemistry, are available than ever before. University laboratories are more handsomely equipped and the number of post-graduate students in chemistry is greater than ever before. If interest in the chemistry of the non-benzenoid hydrocarbons is stimulated, we may yet acquire the necessary fundamental information which petroleum research needs so badly. Such research should be systematic and broad in scope and will require the labor of many for a long period of years. Work of this kind in Russia has practically ceased, and American organic chemists may well give this field of work its due share of attention.

The formation of this petroleum section may promote chemical research on petroleum products and assist in placing chemistry in a more important relation to this industry. Dr. R. B. Sosman, president of the Philosophical Society in Washington, has recently called attention to the difficulties in the way of utilizing scientific information which arises from the great volume and heterogeneity of published scientific research and the wide gap which exists between isolated producers of scientific information and others who can apply or make use of it. It is worth while to recall that American investigations of interest to petroleum technologists have been published in a number of different journals, so that this literature is scattered and inaccessible to many. These considerations were partly responsible for the formation of the Institute of Petroleum Technologists in England, which now publishes an admirable journal. American investigations relating to petroleum have been published chiefly in the *Bulletin of the American Institute of Mining Engineers*, *Engineering and Mining Journal*, *CHEMICAL & METALLURGICAL ENGINEERING*, *Journal of Industrial and Engineering Chemistry*, *Journal of the American Chemical Society*, *American Chemical Journal*, *Proceedings of the Philosophical Society of Washington*, *American Journal of Science*, *Journal of the Franklin Institute*, and also many trade journals, which are filled with personalia, pictures of gasoline-filling stations and like matter, which very few libraries consider valuable enough to bind and preserve. In addition to this, there are a large number of Government bulletins and, as Dr. Sosman has so well pointed out, matters of real value may become submerged in the enormous flood of wood pulp which is thus fed through our printing presses. In view of this scattering of petroleum literature in this country, works such as Bacon and Hamor's recent volumes should be particularly welcome, and one of the most valuable results which this section might possibly bring about is the centralization of material published in America relating to petroleum.

Most large industries have passed through a stage in which secrecy was much prized. Each manufacturer imagined that he possessed keys to mysteries which others did not possess. As instances of this I need only mention the steel industry, the metallurgy and refining of copper, zinc, lead, aluminum, nickel and other metals, the paint and varnish industry, the electrochemical industry, the refining of sugar—and many

others might be added to this list. It may be conceded that in matters of industrial importance, and particularly in the case of patentable matter, a delay in publication sufficient for patent protection is reasonable, but beyond this there is no excuse for the burying of scientific information in private office records. I do not believe that well-informed and progressive business men would consider this question to be a subject of debate, and yet certain petroleum refiners adhere to the old policy, and it may be noted that such refiners are usually the kind who refer to the person whose duties are to make flash point and viscosity determinations as their "chief chemist." The latter remarks are not made in any spirit of criticism merely—in fact such testing work has to be done—but if chemical investigation of petroleum and refinery problems is ever seriously undertaken, the so-called "chief chemist" will not be one whose duties are almost solely taken up with routine tests on the refiners' products.

WHAT CONSTITUTES REFINERY PRACTICE

As regards the refining of petroleum products, we may well use Prof. Fisher's expression, "What is it?" and ask "What does refining really consist in?" Opinions may differ, and usually do, as to what constitutes refining and whether or not a given oil is "refined," "well refined," "poorly refined," "properly refined" or "suitably refined" for a given purpose and what not, but I believe the only answer or definition of refining which can at present be given is substantially this: *Doctoring it, so it will sell.* Petroleum products are "refined" according to the dictates of the salesmen and the standards to which the public has become accustomed. People outside of petroleum refineries object to offensive odors, and therefore one of the first requirements of a refined oil is that its odor shall not be unduly offensive. People generally like pretty colors and the public has become accustomed to insist upon water-white oils in certain cases, light yellow or amber oils in others, pretty red ones in other cases, or oils with a pretty green, bronze or blue fluorescence, as the case may be. The public has become accustomed to and expects these properties in certain oils, but does not expect petroleum oils to be perfumed or colored pink. These physical properties, odor and color, are mentioned in the first place as they are most conspicuous and have considerable to do with the salability of these products, but have little or nothing to do with their suitability or relative excellence in their usual applications.

UNSATURATED HYDROCARBONS MISUNDERSTOOD

One class of hydrocarbons which has been considerably discussed, particularly since the development of the now well-established processes of pyrolytic decomposition, as for example, the Burton process, is the class known as olefines or unsaturated hydrocarbons. Previously the general notion has been that refining consists essentially in removing these unsaturated hydrocarbons, and practically everything in the calendar which could be considered objectionable in an oil, including odor, was attributed to the presence of unsaturated hydrocarbons. But in the case of gasoline or motor fuel it has been shown by Hall and others that ordinary simple olefines behave just as well in internal combustion engines as saturated hydrocarbons; perhaps a little better. In fact, several years ago at the Mellon Institute Dr. Harry Essex made very satisfactory block tests on an automobile engine running entirely on unsatur-

ated hydrocarbons, even turpentine doing very well considering its boiling point and volatility, once the engine had become warm. Offensive odors in motor fuels are due to relatively very small proportions of derivatives containing sulphur, nitrogen and naphthenic acids, and these malodorous constituents can be completely removed independently of the unsaturated hydrocarbons and the resulting motor fuel may be quite superior in odor, and keeping qualities as regards color, to most of the gasoline marketed today.

The economic importance of an adequate supply of motor fuel is such that the unsaturated hydrocarbons present, which in the aggregate represent many millions of gallons, particularly in the case of cracked oils, should not be removed unless it can be conclusively shown that there is good reason to do so. In fact, I have shown in a previous paper on the subject,¹ that refining by ordinary sulphuric acid does not remove all of these olefines, but polymerizes a considerable proportion of them to higher boiling hydrocarbons, which are themselves unsaturated. The presence of these polymers in refined motor fuel may be objected to on the ground of their high boiling point, but not on account of their chemical unsaturation. It would undoubtedly be better to leave the original volatile unsaturated hydrocarbons in the motor fuel than to partly remove and partly polymerize them, as is done in ordinary refining, resulting in loss and in introducing heavy oily residues into the refined product.

In this connection it is worth while to point out that there is no analytical method which gives at all accurately the per cent by volume of unsaturated hydrocarbons in mixtures such as commercial motor fuel or other petroleum products, and in my opinion it is not worth while to seek such an analytical method. These unsaturated hydrocarbons have in the past merely served the purpose of something on which to blame all sorts of troubles and have often been used merely as a cloak for our ignorance. Founded upon some of these notions is the idea that they should be hydrogenated to saturated hydrocarbons and that this would constitute an excellent refining method. At least as regards odor it would do nothing of the sort, and in the case of lubricants the writer agrees with Dunstan that it would be preferable to have larger proportions of them in such oils.

RESINOUS DEPOSITS

It is well known that highly cracked oils leave a thick resinous deposit on slow evaporation in air, and this might conceivably lead to carburetor troubles if such oils were used, but Hall has shown that these resin-forming constituents, present in exceedingly small proportions, can be removed by fullers earth. These resin-forming constituents are probably conjugated unsaturated hydrocarbons, illustrated by isoprene, dimethylhexadiene, cyclohexadiene and the like, which, as is well known, tend to resinify in contact with air. These conjugated diolefines also react very energetically with concentrated sulphuric acid, and this behavior is particularly pronounced in crude benzene from water-gas tar, the light condensate from Pintsch gas and the like. That ordinary unsaturated hydrocarbons, containing one double bond, do not exhibit this behavior has been definitely established—in fact, even pure olefines, with no saturated hydrocarbons present, do not yield

tars with ordinary concentrated sulphuric acid at ordinary atmospheric temperatures, but, on the contrary, the most reactive ones, amylenes and hexylenes, give amber-colored solutions in sulphuric acid. On standing these solutions give steadily increasing proportions of light, amber colored, oily polymers, which form an upper supernatant, oily layer. In the case of the usual hydrocarbon mixtures these polymers are found in the so-called refined oil.

When we consider the refining of lubricating oils we encounter another set of trade customs and prejudices, together with a series of unsolved scientific problems, the most important of which is naturally the subject of viscosity and lubrication. Every one knows that when an unrefined lubricating oil distillate is allowed to stand it darkens rapidly in color, and this proceeds from the exposed surface gradually downward until the whole oil has become very dark in color. This phenomenon is evidently one of air oxidation. As usual, following the old formula, the blame is put upon olefines. However, viscous oily polymers consisting entirely of unsaturated hydrocarbons do not show this behavior. This has been shown in the case of polymers of a wide variety of olefines including amylenes, hexylenes, octenes, decenes, including unsaturated cyclic hydrocarbons of the terpene type, and other unsaturated hydrocarbons of 12 to 18 carbon atoms, either pure, made synthetically or derived from the decomposition of natural waxes and fatty acids. The substances which cause this development of color may easily be minor constituents constituting less than 1 per cent of the crude lubricating distillate, but just what they are we do not know.

TAR-FORMING CONSTITUENTS

It may also be pointed out that unsaturated hydrocarbons, so far as these are actually known, are increasingly stable to sulphuric acid as the molecular weight increases, and do not form tars. As to what the constituents of crude lubricating distillates are which do form the tars observed in refinery practice we do not know, but it does not get us anywhere simply to follow the old tradition and say that the cause of these tars is olefines. We know practically nothing regarding the constitution of the unsaturated hydrocarbons obtained by the polymerization of simpler olefines by sulphuric acid, zinc chloride, fullers earth and the like, but it is practically certain that aluminum chloride acts much more energetically and that the products obtained by its action do not contain ethylene hydrocarbons.

UTILIZATION OF POLYMERIZATION

Is it worth while, from a practical standpoint, to study this question of polymerization? Personally, I am convinced that it is, and a first attempt to utilize this phenomenon in a practical way was made recently by Brownlee, who during the recent war period made lubricating oils by the polymerization, by means of aluminum chloride, of unsaturated hydrocarbons, made by pyrolytic decomposition of gas oil distillate or other cheaper oils. Dunstan in England has suggested that it is desirable to retain olefines in lubricating oils and that they may have lubricating qualities superior to the saturated hydrocarbons. Every possible means of reducing the present large refining losses must be carefully considered. The refining of lubricating oils should, therefore, be carefully studied with the object of discovering methods of refining which will accomplish

¹J. Am. Chem. Soc., vol. 40, p. 822 (1918).

the particular results desired and *no more*. Whether or not Dunstan's contentions are correct should be easily capable of experimental proof or disproof, and Archbutt has recently suggested that such questions be settled once and for all time by studying the behavior of different types of hydrocarbons, either made by synthesis or isolated from commercial oils. When the days of "slaughtering" crude petroleum are over—and they are rapidly passing—research on such problems will be imperative. A study of our production statistics indicates that if the refining losses of lubricating oils could be halved many millions of gallons would be added annually to our supply of lubricating oils.

Brownlee's process of making lubricating oils by polymerization of oils which by themselves are too fluid for lubrication is particularly suggestive and, it may be noted, is a change diametrically opposed to cracking processes. One of the most valuable features of the Burton process is that it gives considerable flexibility to the refinery operations, and the polymerization process should also be of increasing value on this account.

TESTING FOR LUBRICATING VALUE OF OILS

In connection with Dunstan's claim as to the lubricating value of unsaturated hydrocarbons, it may be pointed out that none of the testing methods now employed are any measure of the film strength of a lubricating oil. Physical chemists have pointed out that for a liquid to lubricate two moving surfaces the liquid must be adsorbed by the solid surface, and that the thickness of the effective lubricating film is of the order of 10^{-7} cm., or, in other words, of the order of one to two molecules in thickness, and that flooding a bearing with more oil does not improve lubrication. During the war the value of castor oil or additions of 1 to 2 per cent of free fatty acids to a lubricating oil was clearly shown, this benefit chiefly consisting in greater tenacity or wetting power of the oil for the metal. So far as I am aware there is no term which expresses precisely this property, although the terms "oiliness" and "body" connote something of this behavior. In a moving bearing, under heavy duty, the tendency is for the oil to be squeezed from between the moving surfaces, and if the oil film has not sufficient tenacity or adhering power the film will be broken and metal to metal friction will result. Viscosity measurements, together with years of observation and experience with lubricating oils, has come to be generally considered as being roughly parallel to, if not a measure of, this film stability or film tenacity. Given this analysis of the problem, any reasonably competent mechanic could devise an instrument which would measure this property of oils in a way which would constitute a much more rational means of determining the lubricating value of different oils.

ECONOMIC VALUE OF RESEARCH

It is not too much to expect that economies which can be effected through better refining methods will more than cover the sum total of the cost of all petroleum investigations, even should these investigations be undertaken on a very large scale indeed. Other possible results of research might, therefore, be reckoned as pure gain, and it is worth pointing out in this connection that the actual experience of manufacturers who maintain research is that the big difficult problems yield by far the greatest financial returns in the long run, as compared with the benefits of solving a multitude of easy little problems.

A New Principle of Rotary Pump Construction

BY S. H. FARKAS

THE rotary types of pumps thus far evolved may be divided broadly under the classifications: those using the rotary gear movement, the rotary plunger, and the rotary bucket and packing strip. Practically all these various types require continual replacements, due to the friction taking place either between the moving parts themselves or between the moving parts and the casing.

The illustrations, Figs. 1 to 4, show the two rotating elements of the Exeter rotary pump in sequence of position during one complete revolution. Fig. 5 shows the geometrical construction employed in the design of the two rotors.

Taking Fig. 5 first, an equilateral triangle ABC and a square of equal side are erected on a common base AB .

FIGS 1 TO 4. SEQUENCE OF ROTOR POSITIONS

The angles of the triangle are bisected and the lines produced; the diagonals of the square are also drawn and produced. The circumscribing circles of both triangle and square are also drawn. It will be seen that at the bottom of the figure a distance X is obtained by the intersection of the two circumscribing circles. With the points of the triangle as centers, circles with radii equal to one-fourth of the common side of the triangle and square are described. With O as center and OF as radius, the diagonals of the square are intersected; from the points so found as centers and with one-fourth the common side of the square and triangle as radii, circles are described. The joining arcs for the completion of the square figure are struck with the height of

the initial triangle as radius, while the similar arcs on the triangular figure are struck with the side of the square or triangle as radius.

The first center found is along the vertical center line and the arc contacts with the extreme top of the triangular figure. The explanation is more involved than the actual construction, which can easily be followed from the diagram and the foregoing text using a pair of compasses. The only variation from the geometrical figures so found is that the recesses in the square figures are paralleled out so that the projections on the inner figure may enter. It will be readily seen that all the curves can be generated with relative ease, and even the variation mentioned presents no particular difficulty.

ROTOR POSITIONS

Taking the illustrations in Figs. 1 to 4, in sequence: in Fig. 1, the space 9 between the two rotors is at the maximum. The inlet port has just closed and the outlet

FIG. 6. PARTS OF A 4-IN. PUMP

port is about to open. The entire cycle of movement and variation of one space can be progressively followed through the four diagrams by the numbers 1 to 16. Starting with maximum volume as 9 in Fig. 1, then going to 10, 11, 12, 13, 14, 15, 16, 1, 2, 3, 4, 5, 6, 7, 8 and 9 completes the progression. The capacity of the pump per revolution is three times the volume of space 9.

The pump consists of an outer casing of cylindrical form having a pair of rotors meshing, the inner rotor being keyed to the driving shaft. These two rotors are set eccentric one to the other, the axial line being at the intersection of the bisection lines at O in the geometrical diagram on Fig. 5. The outer rotor has four ports which are open to the chamber of both the suction and discharge side of the pump during rotation. These ports are closed momentarily by a lip at both the top and the bottom of the pump body in order to effect the cut-off between the suction and the discharge of the pump. The liquid is drawn into the pump through the ports of the outer rotor while the pocket is increasing, and forced out at the opposite side of the pump during the last half revolution when the pocket is decreasing.

The rotors themselves are flat acid-resistant castings of suitable thickness, worked on edge to the figures described, their faces being in parallel planes. The outer rotating member is a working fit in the casting at its periphery and is otherwise free, the inner rotor imparting motion to the outer.

The pump is self-priming, easy of installation and can be adapted to almost every pumping condition. Dirt and grit do not seem to affect the pump, inasmuch as there is no rubbing or wearing contact.

Synopsis of Recent Chemical & Metallurgical Literature

Welding Blow-Holes in Steel.—Harry Brearley read a notable paper on this subject before the May meeting of the British Iron and Steel Institute, in which his principal thesis is that the best of welds is never perfect, because the welded surfaces can always be pulled apart, provided the steel is tough naturally, or can be made tough by heat-treatment. Stead's law of welding,¹ "Unless the crystals become common to the two pieces there is no welding," is not rigid on account of the varying amount of interpenetration which may exist, all in apparently good welds, yet all of which can be split apart. Ingots are never quite free from shrinkage cavities, cracks or blow-holes, especially near the axis, and Brearley questions whether these can be welded perfectly—meaning thereby made into metal in all respects as good as any unwelded part of the same piece. In fact, even under most skillful working he feels that such ingot defects are responsible for the "hair-lines" which caused so much trouble during the war in such parts as aero-engine crankshafts. Segregates (especially sulphides) concededly mark their former location; but the trouble lies in the small cavities themselves rather than the sulphide segregate.² In fact, the latter is the telltale witness, in sulphide printing, of the greatest value to metallography, often indicating the pouring temperature, whether top or bottom cast, whether early blow-holes have been subsequently filled by liquid metal, whether axial unsoundness is due to unskillful forging or piped metal; sulphur printing indicates spot segregates on the surface, and "finally it is an indispensable touchstone for the careful steel maker who is making steel for such special purposes as rifle barrels."

As an illustration of the limitations of the present modes of testing welds, several different 3½-in. blooms were drilled axially, a machined 1-in. bar of the same material pressed

¹Jour. Iron & Steel Inst., 1911, vol. 1, p. 54.

²Dr. Rosenhain, in discussing Stead's paper, said he had some experimental evidence to show that certain impurities, especially soluble impurities, facilitated interpenetration of crystals at surfaces being welded.

in, and welded at the ends, heated and rolled into a bar $\frac{1}{2}$ by $4\frac{1}{2}$ in.

Steel	Microscopic Examination	Nick and Break	Impact on Toughened Bar
0.15 C steel.....	Welded perfectly	Weld split	Weld split
0.35 C steel.....	Welded perfectly	Not split at weld	Weld split
3% Ni steel.....	Welded perfectly	Not split at weld	Weld split
5% Ni casehardening steel.....	Welded perfectly	Weld split	Weld split
3 $\frac{1}{4}$ % Ni-Cr steel.....	Welded perfectly	Not split at weld	Weld split

The "nick and break" test must be used with especial caution since it would show the fallacious result that all rolled and forged bars are the better in welding the higher the hardening elements, including phosphorus.

The author proposes a tentative test of weld-ability. Take Izod test-pieces from the sound edge, and the cored middle part of such a bar. The impact strength of the first will represent in great part the force required to propagate the crack already started by the notch. If no weld has occurred in the second bar, the crack will come to a dead stop when it enters the core or leaves it, and a new crack will have to be started in each case, which, as is known, requires proportionally much more energy. A welded bar will have less impact strength across the joint than one which is not so well made. On the other hand, impact strength varies inversely with the hardness, so very hard steels will break through whether properly welded or not. The same is true of all metal having low impact

BROKEN IMPACT PIECES FROM CORED BARS

values. The proposal therefore is to measure the perfection of a weld in terms of the degree of toughness in Izod foot-pounds which must be induced in a steel by quenching and drawing before the weld will be pulled apart in the impact machine, as in the illustration.

On this basis the results of some steels tested are shown below:

Steel	Analysis			Weld-ability	Tension Fracture
	C	Ni	Cr		
A	0.34	3.26	0.28	28	Cored
B	0.34	3.11	0.28	20	Cored
C	0.32	3.11	0.28	18	Normal
D	0.35	3.57	1.05	14	Cored

Under the microscope all the welded surfaces were distinguishable; after annealing all but steel D showed well defined ferrite strings at the former junction, enclosing minute dark spots or threads supposedly of slag.

Even granting that blow-holes cannot be perfectly welded, it would appear that bars made from open steel would be better than from dead-melted under cross-grained impact. Hence the toughness of wrought iron, due to its slag inclusions which would be an unacceptable defect in steel. Hence also the preference for effervescing steel shown by many makers of leaf springs. However, since Brearley's experiments on cored bars, made under the best circumstances as to cleanliness, do not weld perfectly, he concludes that segregates in cavities are not the cause of imperfect welding, nor the cause of transverse weakness in tension.

American Patents

Complete specifications of any United States patent may be obtained by remitting 10c. to the Commissioner of Patents, Washington, D. C.

Calcium Carbide and Cyanamide.—The heat required for the formation of calcium carbide may be derived from the combustion of an excess of carbon in the charge provided that an oxygen blast is used. Oxygen for this purpose may be available from air separation or reduction apparatus of any well-known type, which will also supply the necessary nitrogen for the conversion of the carbide directly and continuously into cyanamide. Apparatus for accomplishing these results is described by FRED E. NORTON of Worcester, Mass. The charge with its excess of carbon is fed into the top of a vertical retort, the bottom of which is flared into a large chamber. Tuyeres for the introduction of oxygen are situated just above the chamber. Molten carbide which collects in the form of slag in the bottom of the chamber is discharged through a taphole in a continuous stream. If it is desired to make cyanamide, the reaction can be carried continuously as fast as the molten carbide flows out of the furnace, without resort to the heretofore intermediate steps of cooling, pulverizing and reheating the carbide. To this end the spout may discharge the molten substance into a disintegrator consisting of a water-cooled tunnel and a continuous blast of nitrogen from a jet or nozzle. The disintegrated and partly cooled substance passes continuously to a conveyor within a closed nitrogen-filled container in which the cyanamide reaction is completed. (1,374,317; April 12, 1921.)

Temperature Control in Production of Anthraquinone by Catalytic Oxidation.—This invention is for a process of producing anthraquinone from anthracene. By this invention use is made of the principle that vaporizable liquids will absorb latent heat in changing from the liquid to the vapor state without change in temperature, the heat being carried away by the vapors from which it may be extracted, thereby condensing the vapors which may be returned for absorbing more heat.

In Fig. 1 the reference character 1 refers to a container which is provided with a perforated plate 2 upon which a layer of catalyst 3 or carrier such as pumice or asbestos for said catalyst is placed. Electrical heating means are shown at 4 and a series of pipes 5 with closed ends extend into the catalyst 3 or the carrier for the same. The upper ends of the pipes 5 terminate in a header 6, which may be connected to a pump 7, which may be used either to create a vacuum or pressure in the pipe or to introduce a gas, preferably neutral, into the header from a source, not shown. A valve V in the pipe P may be closed, if desired, after the pump 7 has been operated to obtain the desired condition in the system. The lower ends of the pipes 5 are filled with a liquid which may be vaporized and then be condensed in the upper end of the tubes 5 and run back into the lower ends. A deflector 8 is shown in the lower part of container 1, which has an inlet 9, and the container 1 is surrounded by a casing or housing 10 having a partition 11 and an outlet 12.

In the modification shown in Fig. 2, the container 1¹ is provided with an outlet 12¹, and a pipe 13 leads to the inlet 9¹ from the jacket 14 which surrounds the upper portion of the tubes 5¹. The other parts shown in Fig. 2 are similar to the corresponding parts described in connection with Fig. 1.

The operation according to Fig. 1 is as follows: The reaction mixture is introduced through inlet 9 into container 1, where it comes into contact with the catalyst 3. If necessary, the heater 4 may first bring the temperature up to that required to initiate the catalytic reaction which is an exothermic one. The catalyst 3 becomes heated and the heat is conducted through the walls of the tubes 5 to the liquid

therein, which is caused to boil and the vapors rise in the tubes 5, the upper ends of which are cooled in any convenient way so that the vapors become condensed and trickle back into the lower ends of the tubes 5. The liquid in the tubes is not heated above its boiling point, because an increase in the heat transmitted to the same merely causes an increase in the ebullition without a rise in temperature. The pressure in the system may be increased or diminished by means of the pump 7, thereby varying the temperature

Fig. 1.

Fig. 2.

at which the liquid will boil. After the reaction mixture has passed through the catalytic zone, the products of reaction pass upward around the wall 11 and out of the outlet 12, so that the products may be collected and used. The operation according to Fig. 2 is the same as that above described in connection with Fig. 1 except that the reaction mixture is passed through jacket 14 so as to come into contact with the catalyst 3'. The products of reaction pass out through the outlet 12'.

A specific application of this invention is in the oxidation of anthracene to anthraquinone in the presence of vanadium oxide as a catalyzer. It has been found that the proper temperature at which this reaction should be carried out is about 375 deg. C., because very much higher temperatures cause the oxidation to progress too far, and the reaction will not take place satisfactorily at very much lower temperatures. Mercury boils at 357 deg. C., and if a proper pressure is applied upon the mercury its boiling point is changed sufficiently so that if a mixture of an oxygen containing gas and anthracene in the vapor phase is passed into the catalyst the exothermic reaction to produce anthraquinone will raise the temperature enough to provide sufficient temperature gradient or head between the catalyst 3 and the liquid in tubes 5 when this liquid is mercury so that the exothermic heat is transmitted from the catalyst to the mercury with sufficient rapidity to keep the temperature of the catalyst at about the proper point, or near 375 deg. C. The temperature will be automatically regulated to a certain extent, for when more heat is evolved the mercury will boil more rapidly and thereby remove heat more rapidly. The cooling surfaces of the pipes 5 will be made large enough to assure condensing of all the vapors, and the pressure maintained in the pipes will be such as to keep the boiling point of the liquid mercury so that it will hold the catalyst at the proper temperature. When mercury or other oxidizable liquid is used as the heat-removing agency it may be advisable to introduce into the tubes 5 a neutral gas, such as nitrogen, to prevent oxidation of the liquid. Further examples of chemical reaction to which this invention is applicable are the oxidation of naphthalene to phthalic anhydride, ethyl alcohol to acetaldehyde, and the chlorination of hydrocarbons, etc. (1,347,721; CHARLES R. DOWNS, of Cliffside, N. J., assignor to The Barrett Co.; April 12, 1921.)

Acid-Resisting Articles.—While an alloy of iron and chromium containing certain proportions of iron and chromium carbides is highly resistant to the action of sulphuric acid, such an alloy is brittle and difficult to machine. ALVAH W. CLEMENT, of Cleveland, Ohio, first prepares an alloy of about 60 per cent Cr and 40 per cent Fe under conditions which make the alloy practically carbonless. Articles formed or machined from this alloy are then carbonized to give an acid-resisting surface. (1,375,673; assigned to Cleveland Brass Mfg. Co.; April 26, 1921.)

British Patents

For complete specifications of any British patent apply to the Superintendent British Patent Office, Southampton Buildings, Chancery Lane, London, England.

Separating Creosote From Tars.—Phenolic bodies are extracted from tars such as lignite, shale, peat, coal, producer and low temperature tars, and from tar distillates and residues and from mineral oils and distillates by washing with a mixture of acetone and water. Acetone extracts of the tars, etc., may be mixed with water or aqueous acetone to cause the separation of the oils, while the creosote remains in solution. (Br. Pat. 156,694; not yet accepted; E. ERDMANN, Halle-on-Salle, Germany. March 16, 1921.)

Zinc White.—Zinc carbonate, oxide and sulphide are prepared from any zinc-containing material by the following reactions. The zinc ore, fume, etc., is first dissolved in acid, preferably hydrochloric, and purified by known means. By passing carbon dioxide in the presence of magnesia or magnesium carbonate into the zinc solution, zinc carbonate is precipitated while magnesium chloride, if hydrochloric acid was used to dissolve the ore, is formed in solution. After filtration and washing, the liquor is concentrated and by the addition of magnesia solid magnesium oxychloride is formed which is readily converted into hydrochloric acid and magnesia for re-use, by heating. Zinc oxide may be obtained from the carbonate by calcination, but preferably by treatment with dilute caustic soda or potash solution which is recovered by means of lime from the resulting alkali carbonate. The precipitated zinc oxide is removed and dried and the solution made by dissolving it in acetic acid or dilute mineral acid is used to prepare zinc sulphide. After the precipitation and removal of the latter, the liquor is used again by redissolving a further quantity of zinc oxide or carbonate and reprecipitating as sulphide. Alternatively the sulphide is prepared by passing sulphuretted hydrogen into a closed mixing device containing a suspension of excess of zinc carbonate in water, or in a dilute solution of hydrochloric acid or zinc salt. Sulphuric acid may be used in the place of hydrochloric for dissolving the ore, but the latter is preferred since it enables the magnesia and acid to be recovered readily. (Br. Pat. 157,860; not yet accepted; C. CLERC and A. NIHOUL, Paris. April 6, 1921.)

Separating Air From Feed Water.—Apparatus of the character described in the parent specification for separating gases from liquids is arranged on the suction side of the water feed to steam-generators. The air-removing

chamber *h* is supplied with water from the tank *g* through the valve *x*, and the purified water is drawn off through the outlet *k* by the injector *d* and forced through the pipe *c* into the boiler. The overflow pipe *v* dips into a reservoir *w*. The air-removing chamber *h* is constructed with a perforated plate *o*, alternating inclined shelves *p*, *p'*, *p''*, *p'''* supporting the turnings, shavings, fibrous material, or other substance for causing the air to separate, and with a series of angle-bars *s* supported on an angle-ring *r* which form a kind of partition between the purified water and the uppermost layer of water which is in contact with the separated air at the top of the chamber. (Br. Pat. 157,790; not yet accepted; C. HULSMAYER, Düsseldorf. April 6, 1921.)

Treating Tin-Bearing Tailings.—Tin-bearing rocks having a small content of stannic oxide, or "tailings" left after the mechanical separation of stannic oxide, are reduced by suitable gases, and the resulting metallic tin associated with a large quantity of gangue subjected to the action of anhydrous chlorine.

The reaction vessel is provided with a jacket through which a cooling medium may be circulated in order to maintain approximately atmospheric temperature. The stannic chloride thus produced is separated by leaching with a solvent such as warm water or caustic soda solution, by distillation preferably at reduced pressure, or by blowing hot air on the heated mass. The volatilized stannic chloride is condensed in water and the hydrated chloride used to prepare other tin salts or metallic tin. The latter is extracted by passing the solution of stannic chloride into a series of boxes each containing zinc turnings; spongy tin is precipitated, while zinc chloride free from tin collects in the last box. The addition of a small amount of stannic chloride is found to facilitate the commencement of the reaction between the metallic tin and the chlorine, and if the ore contains arsenic or sulphur these are removed by roasting before the reduction of the stannic oxide. (Br. Pat. 159,071; J. J. COLLINS, Winsford, Cheshire. April 27, 1921.)

Book Reviews

RESEARCH AND METHODS OF ANALYSIS OF IRON AND STEEL (Second Edition). Pp. 220. By Research Department of the American Rolling Mill Co., Middletown, Ohio, 1920. Price \$4.

This book is a publication of the control practice, along physical and chemical lines, adopted by the well-equipped laboratory of a modern rolling mill producing a specialized product—ingot iron. In addition, chemical methods used by this company in research and investigative work are also described, such as for the determination of the gaseous constituents of iron and steel. Following the introduction and a short chapter given to Ancient Irons and Modern Research, the book is divisioned accordingly: Research on Corrosion; Magnetic Testing; Metallurgical Control; and Chemical Analysis; with subsequent pages including Useful Data and the Index.

The dissertation on research on corrosion is devoted exclusively to the possible or probable effects that gaseous impurities in ferrous metals have on their corrosion. One is first acquainted with the respective works of Miller and Austin relative to the considerable quantities of occluded gases found in both liquid and solid steel, and also with the beneficial results obtained in the physical properties of a steel degasified by vacuum treatment. From these observations arise a conception that possibly the gaseous constituents of steel may have a considerable bearing on its life under corrosive conditions. The results of investigations by the research department on the gas content of materials showing good and poor corrosion resistance are then given, with the fact stressed that in all cases the nitrogen content is higher in the rapidly failing steels than in those that are more resistant. Throughout this chapter are presented photographs of old iron and modern steel fabrications, showing respectively excellent and poor states of preservation after service.

Under Magnetic Testing the description of necessary apparatus and procedure for testing the magnetic properties of steel and iron is essentially the same as found in the standards of one of our national societies. The heading Metallurgical Control covers principally a description of the equipment used by the American Rolling Mill Co. for the pyrometric, metallographic and physical control of its output during and at completion of production, with a general outline of the work entailed in the mill and laboratory. More than half of the volume is devoted to Chemical Analysis, where are given in alphabetical sequence methods for the determination of all elements, common and rare, encountered as impurities in iron and steel.

This includes the gaseous elements, hydrogen, oxygen, nitrogen (as nitride), and also the compound carbon monoxide. Considerable space is allotted to different procedures for carbon, with the inclusion of a detailed description of the gasometric method devised and used by T. D. Yensen for the separate determination of the different forms of carbon in iron—viz., gaseous and solid. Besides the procedures for determining the constituents occurring in iron and steel, complete instructions are given for the evaluation of the metallic coatings commonly applied to ferrous products. Details are presented regarding the selection of samples, with particular reference to sheets. A description of Dr. A. S. Cushman's new method for determining the weight of spelter coating by measuring the hydrogen evolved brings up to date this branch of testing.

Taken as a whole, the book can scarcely be recommended as a general text for the iron and steel chemist or metallurgist. While true to the title, in that methods are given for the determination of practically every constituent encountered in iron, in many cases valuable details or notes are lacking, a fact at least partly recognized by the authors, who state in the preface, "Where well-known methods have been described, we have omitted details which are well understood by the skilled chemist. Where new methods are described, we have entered into minute details." Therefore the value of the book revolves largely about the call the user has for these uncommon procedures. As the treatise Research on Corrosion deals only with the rôle that may be played by gaseous inclusions in iron or steel and no mention is made of those constituents whose presence in ferrous metals has been more or less generally recognized as inhibiting corrosion, the non-inclusion of these types in the data exhibited militates seriously against the significance that might otherwise attach to the interesting findings here presented.

This handsomely finished little volume is palpably a medium of publicity; however, since it contains some uncommon technical data of value and a contribution of new thoughts and work, it has a certain value in the library of those interested in iron and steel.

PYROMETRIC PRACTICE; Technologic Paper 170, Bureau of Standards. By *Paul D. Foote, C. O. Fairchild and T. R. Harrison*. 326 pages, 7 in. x 10 in. Price, 60c., from the Superintendent of Documents, Government Printing Office.

Pyrometric practice has become so widespread in recent years that a real need has been felt for a supplement to the standard work of Burgess and LeChatelier on "Measurement of High Temperatures," describing the many successful instruments which have been recently marketed. It is only fitting that such a book should come from men attached to Dr. Burgess' division of the Bureau of Standards, men who have had every opportunity to compare the various types and who have already written much helpful information on various phases of this subject in technical journals and society proceedings.

The Burgess-LeChatelier work is indispensable for its treatment of fundamentals; indeed there seem to be no instruments described in "Pyrometric Practice" which are not directly traceable to the types discussed in the older book. However, the new publication illustrates the large number of available pyrometers, indicators, recorders and fittings by photographs and diagrams of actual instruments or installations, whereas the sketches as well as the discussions in the older book are more of ideals.

In recent years there has come into being a type of metallurgist who must know about temperature control of industrial operations; some men are so specialized that the care of pyrometer installations occupies their whole time. All such will welcome the new book, and find in it a clear, unbiased description of practically every type of temperature-measuring device now on the market, invaluable information on the proper installation and use of all this various equipment, and a large number of helps in keeping it operating correctly. Burgess and LeChatelier and Foote, Fairchild and Harrison will be the pyrometricians' Old and New Testaments.

in the Chemical and Metallurgical Industries

Hotel Accommodations for Fall Meeting, A. C. S.

Hotel headquarters for the meeting of the American Chemical Society in New York City, Sept. 6-10, 1921, will be at the Waldorf-Astoria Hotel, Fifth Ave. and Thirty-third St. Through the courtesy and co-operation of the Hotel Association of New York City the committee has arranged to receive applications and make reservations at the various hotels throughout the city. Applications should be made promptly, and it is suggested that two or more persons take advantage of double rooms and suites wherever possible. Prices at the various hotels range from \$1.50 to \$5 per day for single rooms and from \$3 to \$10 for double rooms.

Columbia University has offered the facilities of its dormitories to aid in meeting the requirements of those desiring to attend the meeting. Rooms for men, rooms for women and rooms for married couples have been reserved in the dormitories at the rate of \$1.50 per day per person, with a maximum per person of \$10 for the period Sept. 6 to 16, for those wishing to stay for the Chemical Exposition.

Applications, giving the following information, should be forwarded as soon as possible to Charles F. Lindsay, chairman of the hotels committee, c/o United States Rubber Co., 1790 Broadway, New York City:

Application for.....persons.
Names of those in party.
Type of reservation desired.
Maximum price per day per person.
Time of arrival.
Expected departure.

Reservations will be confirmed from the designated hotels.

Young Opposes Longworth Resolution

The only Republican member of the Committee on Ways and Means of the House of Representatives who objected to the Longworth resolution, which has as its object the placing in immediate effect the duties carried in the forthcoming tariff bill, was Representative Young of North Dakota. He did not submit a minority report, but in a statement he takes the position that such legislation would be unconstitutional. He says that the decisions of the United States Supreme Court always have been that Congress cannot delegate legislative authority. Representative Young contends that it will require a faith in the Ways and Means Committee nothing short of sublime to give rates of duty force of law before those rates are known to members of Congress. He points out that the agitation of the question is likely to result in waste of time. He doubts if the resolution will pass the House and he feels very certain that the Senate will not abdicate and calmly allow a general tariff bill to become a law for a period of five months without its having been considered by the upper house. He also doubts if the President will tie his own hands in matters not only affecting economic considerations but possible complications with foreign countries.

Representative Young contends that the proposed action does not have a parallel in the somewhat similar procedure of certain foreign governments. "The government" in those countries, he points out, holds office at the pleasure of the popularly elected branch of the legislature and can be voted out of office promptly if it reports customs rates or provisions which are unsatisfactory. The government or ministry in these foreign countries, Mr. Young points out, is charged with executive functions and responsibilities, whereas the Ways and Means Committee has no such responsibility.

Final Program, American Leather Chemists Association Meeting

The eighteenth annual meeting of the American Leather Chemists Association will be held at the Hotel Ambassador, Atlantic City, June 9, 10 and 11. Morning sessions will convene at 10 o'clock, afternoon sessions at 2 o'clock.

THURSDAY MORNING, JUNE 9

Opening remarks by the president, F. H. Small.

Report of secretary-treasurer, H. C. Reed.

The Effect of Atmospheric Humidity on the Determination of Moisture in Leather, T. D. Jarrell.

Committee report: Determination of Epsom Salts in Leather, R. W. Frey.

Committee report: Determination of the Sugar Content of Leather, J. S. Rogers.

THURSDAY AFTERNOON, JUNE 9

Relation of South America to the Leather Industry, G. A. Kerr.

Committee report: Sampling and Preparation of Leather for Analysis, F. H. Small.

Soaking and Liming Hides, C. M. Morrison.

Some Applications of Synthetic Tanning Extracts, J. B. Hill and G. W. Merryman.

Some Effects of Post-Mortem Changes in Fresh Hides, G. D. McLaughlin.

Demonstration of the Explosiveness of Tannery Dusts, R. W. Frey.

FRIDAY MORNING, JUNE 10

Committee report: The Determination in Leather of Matter Extractable by Water, J. A. Wilson.

Notes on the Extraction of Leather, F. P. Veitch and R. W. Frey.

Further Observations on the Wilson-Kern Method of Tanning Analysis, G. W. Schultz.

Committee report: The Direct Measurement of the Plumping Power of Tan Liquors by the Clafin Method, A. A. Clafin.

Rapid Washing of Chromed Hide Powder, R. W. Frey and I. D. Clarke.

FRIDAY AFTERNOON, JUNE 10

Chestnut Wood Tanning, R. W. Griffith.

Colloids, H. N. Holmes.

Conditions in the Leather Industry, L. J. Robertson.

Tanning Materials in the Far East, L. Balderston.

Determination of Available Calcium Oxide in Lime Used for Unhairing Hides, F. P. Veitch and T. D. Jarrell.

SATURDAY MORNING, JUNE 11

Committee report: The Color Measurement of Vegetable Tanning Solutions, T. Blackadder.

Committee report: Estimation of Oils and Greases in Leather, F. P. Veitch.

Executive session.

Election of officers.

Council meeting.

Research Chemicals Committee Named

The National Research Council has approved the appointment of a committee to prepare a list of research chemicals. The membership of the committee is as follows: W. D. Collins, chairman; Roger Adams, Captain D. B. Bradner, H. T. Clarke, W. F. Hillebrand, George C. Spencer and Clarence J. West. This committee will prepare a list of sources of various materials not commonly available, particularly those needed for special researches.

INTERIOR EIGHTH COAST ARTILLERY ARMORY

Seventh National Exposition of Chemical Industries

Announcement has just been made that the Seventh National Exposition of Chemical Industries will be held in the Eighth Coast Artillery Armory, Jerome Ave. and Kingsbridge Road, New York City, during the week beginning Sept. 12. Some idea of the facilities available may be obtained from the accompanying illustration showing the drill floor of the armory. There will be ample room for the 400 or more exhibits on this floor, which, it will be noted, is entirely free from obstructing posts and pillars. The armory is readily accessible from all parts of the city, the running time from Grand Central by way of the Jerome Ave. extension of the Lexington Ave. subway being about 30 minutes. It is also provided with an auditorium in which the symposiums and exhibitions of motion pictures will be held and with a dining room that will accommodate 1,400 persons.

During the week preceding the Exposition, chemists and chemical engineers from all parts of this country and from abroad will gather in New York for the joint meeting of the Society of Chemical Industry and the American Chemical Society. Those present at this meeting will thus be able to attend the Exposition as well.

Dr. Charles H. Herty, editor of the *Journal of Industrial and Engineering Chemistry*, is chairman of the advisory committee in charge of the 1921 Exposition. Others on this board include Raymond F. Bacon, director, Mellon Institute; L. H. Baekeland, honorary professor chemical engineering, Columbia University; Henry B. Faber, consulting chemist; John E. Teeple, president, the Chemists Club; Bernhard C. Hesse, chemist, General Chemical Co.; Acheson Smith, president, American Electrochemical Society; A. D. Little, president, Arthur D. Little, Inc.; William H. Nichols, chairman of the board, General Chemical Co.; H. C. Parmelee, editor, *CHEMICAL & METALLURGICAL ENGINEERING*; Fred W. Payne, co-manager of the Exposition; R. P. Perry, vice-president, The Barrett Co.; Charles F. Roth, co-manager of the Exposition; Edgar F. Smith, president, American Chemical Society; T. B. Wagner, vice-president, U. S. Food Products Corporation; David Wesson, president, American Institute of Chemical Engineers, and M. C. Whitaker, president, United States Industrial Chemical Co. The headquarters of the Exposition are now located at 342 Madison Ave., New York City.

Helium Repurification

The U. S. Bureau of Mines has undertaken to complete the installation of apparatus for the repurification of helium at the Langley Field plant. The work is being done in co-operation with the Army and is under the general direction of Dr. R. B. Moore, chief chemist of the Bureau of Mines. D. M. Ferris is the engineer in immediate charge.

Bureau of Mines Technical Motion Pictures

Motion pictures of ingot iron manufacture and of sulphur production formed the program of the 320th meeting of the Chemical Society of Washington on May 25. These films were furnished by the Bureau of Mines, which has a long list of such technical motion pictures for distribution. Any society or local section desiring the use of this sort of an entertainment should apply to T. T. Read, Division of Education and Publications, Bureau of Mines, Washington. There is no charge made by the bureau for this use of the various pictures which have been prepared in co-operation with the industry.

American Society of Mechanical Engineers Spring Meeting

The spring meeting of the American Society of Mechanical Engineers convened at the Congress Hotel, Chicago, Ill., May 23-26. A large attendance held a number of activities which were of direct interest to operators and owners in the chemically-controlled industries. Some of the papers presented are briefly abstracted in the following report.

FUEL SESSION

E. G. Bailey in an exhaustive paper on recording ash-pit loss from chain-grate stokers gave data obtained from a recently-developed device which enables firemen to effectively control this factor. The device in the main consists of a steel tube or bulb filled with nitrogen and connected through a capillary tube to a recorder consisting of a mercury U-tube, one leg of which is open to the atmosphere and carrying a float to which the recorder pen is attached. It has been found that when this bulb is properly located near the rear of a chain-grate stoker, its temperature will respond definitely to changes in the amount of combustible matter going to the ash-pit and will vary in direct proportion to the heat thus lost. This relation between temperature and ash-pit loss is not materially affected by grate feed, rate of combustion or percentage of ash in coal, but should be determined for different types of installations by actual tests.

Recording instruments have been devised which show on the same chart the ash-pit loss, excess air, unburned gas, flue-gas temperature and steam flow. The records thus obtained make it possible to plot characteristic performance curves for stokers showing the losses due to unburned combustible, unburned gases and excess air, and to determine the proper amount of excess air to be maintained and also the most efficient capacity. These curves can be used to compare the relative efficiencies of different types of stokers, the suitability of different kinds of coal, and the effectiveness of the control by the fireman.

Henry Kreisinger and John Blizzard presented a summary of the results obtained in an extended series of tests on a

468-hp. water-tube boiler fired with pulverized Illinois coal which showed that contrary to the customary specifications it is not necessary to pulverize the coal to the extreme fineness of 85 per cent through a 200-mesh screen in order to get good combustion and good efficiency. This ability to burn coarser coal means increased capacity of the pulverizing mills and decreased cost of coal preparation. The results also show that it is not necessary to dry coal to about 1 per cent moisture in order to burn it successfully in pulverized form and it is stated that with most Eastern coals drying is not at all necessary. Good results can be obtained when the coal is burned at rates varying from 0.5 lb. to 2 lb. per cu.ft. of combustion space per hour, and the best results at a rate of 1 to 1.5 lb.

Edward H. Tenney discussed the limitations imposed on mechanical stokers by the use of Mid-West coals, which are characterized by higher moisture, volatile and ash contents as compared with Eastern coals; the limits imposed by air supply and by the design of the furnace; and the effect of these various limitations on stoker operation. In general the application of mechanical stoking equipment to the use of Mid-West coals has proved to be eminently successful. Specially designed arrangements for air supply and to facilitate ignition of the fuel have been provided, and furnace volumes and gas passes have been scientifically studied, with the result that the most difficult problems—namely, those incident to operation at high rates of combustion—have been satisfactorily solved.

John E. Wilson, of Swift & Co., in speaking of capacity and efficiency limitations of stokers using Mid-West coals, said that less progress had been made in the direction of securing efficient combustion than in any other direction immediately connected with stoker service. In the case of natural draft chain-grate stokers the greatest losses are those due to the dry chimney gases and carbon in the ash, and the possibility of making a material gain in the efficiency lies to a great extent in ability to reduce these two losses. A certain amount of air admitted over the fire has been found advantageous when high volatile coals are used, such as those found in the Middle West. Chain-grate stokers provided with forced draft operate successfully under continuous high rating, respond quickly to load requirements and will successfully burn coal containing a large percentage of ash which fuses at a comparatively low temperature.

Underfeed forced-draft stokers in the Mid-West district have a large number of very satisfactory operating records to their credit both from an efficiency and a capacity standpoint. Some types of overfeed stokers have also been used with success in this section where only a limited capacity was required and suitable coal was available. The necessity of securing improved refractories as well as improving the furnace design is emphasized by the difficulties encountered with the brickwork when forced-firing is employed, and it is possible that these may prove factors governing the capacity which will be obtained in future installations.

A paper by Frank Chambers on the "Latest Requirements of Chicago in Furnace Design" with special reference to hand-fired boilers was presented in abstract by Robert Kuss. It contained some data on draft drop through the setting and in the gas passages, velocity of gas flow, area and height of stack, city requirements and typical designs of furnace.

GENERAL SESSION

Snowden B. Redfield described some capacity tests of dry vacuum pumps by the low-pressure nozzle. A nozzle was used in which the downstream or back pressure is higher than the critical. This permitted the determination of several values of volumetric efficiency over a range of vacua without changing the nozzle. Graphic proofs of the accuracy of the theory of the nozzle were presented, showing clearly that the method of plotting results permits ready estimation of approximate performance of any given pump.

Magnus W. Alexander and Dugald C. Jackson, in a paper on "The Engineering Industries and Engineering Education," stated that a combination of empiricism and training in rational science is needed in engineering education, because it is needed in the engineering industries. This consideration has led to various plans for placing engineering stu-

dents within the influence of industrial operation, the most common being for engineering college graduates to enter industrial establishments as engineering apprentices or student engineers. The plans put into effect at the Massachusetts Institute of Technology and the University of Cincinnati were outlined. It is believed that these experiments in co-operative engineering training will exert a most beneficial influence upon the relation of the engineering college to industry upon the activities of each. While co-operative training in engineering cannot replace the regular engineering courses at colleges, it is nevertheless destined to become a vital integral part of a comprehensive system of engineering education to the detriment of none of the other parts, but to the mutual benefit of all, and is particularly important to the manufacturing industries of the nation.

R. S. Johnston, of the Bureau of Mines, Washington, reported the results and conclusions from an elaborate series of tests on oxy-acetylene welding and cutting blowpipes. This paper, without doubt, described the most complete series of tests on oxy-acetylene welding that has ever been published. The general conclusions were that there is a great deal of difference between the characteristics of different designs of cutting blowpipe and that there is no make of apparatus which is equally efficient and economical for all thicknesses of metal.

J. R. McDermet, in a discussion on the "Interpretation of Boiler-Water Analyses," emphasized the importance of taking into consideration the corrosive properties of a boiler-feed water as well as its scale-forming tendencies. Feed-water impurities fall into at least one of three groupings: dissolved solids, pollution products, and dissolved gases. The dissolved products determinable under a technical analysis naturally group themselves into corrosive and scale-forming constituents according as they are or are not highly ionized in aqueous solutions. Pollution products are detected by inferential methods in a partial sanitary analysis, but the effects of various types of pollution other than manufacturing wastes as indicated by the analysis are concretely set forth. Dissolved-gas analyses (meaning in the main dissolved-oxygen analyses) were discussed in relation to the safe operating limits of hot-water feed lines, boilers, and cast-iron steel-tube economizers.

An appendix to this paper translates the facts into a working plan for use in the chemical laboratory.

POWER SESSION

Samuel Insull, presiding officer, opened the power session with the remark that it took a great war and a British commission to convince this country that concentration in the production of electrical energy was an economic gain. Superpower plan proposed for the East was good and well worth considering, but if engineers in general would pay more attention to the forwarding of similar projects in their respective localities their efforts would be more effective. In the Mississippi Valley there are few locations where large plants can be located at the mouth of the coal mine due to the lack of water, and they must therefore be placed at the centers of distribution with no waste or duplication, each serving the surrounding territory and all tied together with a network of transmission lines. This can be done economically. Prominent factors, then, in this territory where relatively small water power is available, are cheap transportation and ample water facilities for cooling and boiler-feed water.

W. L. Abbott, in discussing the location and distribution of central station power in the Middle West, stated that this section of the country contained only 18 per cent, or 776,000 kw., of the water power of the United States, the greater part of this lying in the States of Michigan, Wisconsin and Minnesota. Ohio, Indiana and Illinois, which are the richest in coal, are poorest in water power. It is cheapest to ship coal by rail to plants advantageously located than to generate at the mouth of the mine and have a standby station in the city with a transmission line between, this being true even with the excessive and unequal freight rates now in force.

C. W. Place, speaking of the future power development in the Middle West, pointed out that in this territory large centers of generation have been developed, but they are

far apart, and each has its tributary country of low load density made up of towns and villages with farming country drained by innumerable streams that should supply power to the towns and villages near them. In the fourteen central states there are 102 cities of over 25,000 people each with a fairly efficient steam plant. It is proposed that the power houses of these cities be connected together not by heavy high-voltage lines, but by lines which will pick up the small town and village loads to the point where its next large neighbor would take its share. Hydro-electric plants along these lines would be automatically connected in.

BUSINESS SESSION

The following nominations were announced for officers of the society: President, Dexter S. Kimball; vice-presidents, Colonel E. A. Deeds, Robert Sibley, L. E. Strothman; managers, Sherwood F. Jeter, Horace P. Liversidge; treasurer, William H. Wiley. Members of American Engineering Council, Francis Closson, Charles A. Booth, Gano Dunn, H. H. Esselstyn, W. S. Lee, Irving E. Moulthrop, John A. Stevens, A. E. Walden and Perley F. Walker. Atlanta, Ga., was named as the place at which the next spring meeting would be held.

Subjects for Papers Before the American Society for Steel Treating

Prof. H. L. Campbell, Ann Arbor, Mich., has been appointed chairman of the meetings and papers committee of the American Society for Steel Treating. Associated with Prof. Campbell on this committee are: George O. Desautels, president of the Imperial Drop Forge Co., Indianapolis, Ind., and Victor Hillman, metallurgist, Crompton & Knowles Loom Works, Worcester, Mass.

The board of directors has authorized the awarding of a gold medal for the best paper presented at the Indianapolis convention and a silver medal for the second best paper. While the awarding of these medals for this year has been made to apply to those papers presented for this year's convention, the policy in future will be to award the medals to the first and second best papers presented before the society during the year.

A list of subjects upon which papers will be presented follows:

GENERAL TOPICS

1. The Organization and Management of a Heat-Treating Department.
2. Practice of Handling and Checking Materials to and From Heat-Treating Department.
3. Quantity Production Methods for Forging and Heat-Treating Tools.
4. Methods for Heat-Treatment of Very Small Machine Parts.
5. Heat-Treatment of Sheet Steel Parts as Saws, Hack Saw Blades, etc.
6. The Artificial Seasoning of Hardened Steel.
7. Furnace Design With Reference to Fuel Economy.
8. Metallography and Its Application.
9. Comparative Study of Methods for Heating Furnaces by (a) Coal, (b) Fuel Oil, (c) Gas, (d) Electricity.

ALLOY STEELS

1. Topical Discussion of Alloy Steels and Their Heat-Treatments for Specific Purposes; as (a) Springs, (b) Gears, (c) Finishing Tools, (d) High-Speed Cutting Tools, (e) Dies.
2. Practice of Ordering Tool Steel on Specifications.
3. Cutting Efficiency of High-Speed Steel Which Has Received Different Methods of Hardening.
4. Die Blocks and Their Heat-Treatment.

CARBURIZING

1. Carburizing Practice Adapted to Alloy Steel Parts.
2. Determination of Unit Cost of Carburizing Steel Parts.
3. Efficiencies of Different Mixtures for Cyanide Hardening.
4. Practice of Cyanide Hardening.
5. The Service of Annealing Boxes Made of Different Materials.

Personal

C. L. BRYDEN, chief engineer for the Kelly Filter Press Co., New York City, has associated himself with W. P. Heineken, engineer and manufacturer, New York City.

PAUL H. HSU, a graduate of the Massachusetts Institute of Technology and formerly research chemist with the Larkin Co., Buffalo, N. Y., and the chemical division of the Procter & Gamble Co., Cincinnati, Ohio, is now on his way to China, where he expects to engage in consulting work and marketing of chemical machinery and materials.

Dr. R. B. MOORE, chief chemist of the Bureau of Mines, delivered the Sigma Xi lecture at the University of North Carolina on June 3. His subject was "Helium."

O. C. RALSTON has been named assistant chief metallurgist by the Bureau of Mines. His appointment will become effective July 1. His headquarters will be at Berkeley, Cal., where he also will have charge of the work at the Berkeley station. He will direct all the work of the bureau on non-ferrous metals. Since Jan. 1 Mr. Ralston has been superintendent of the Seattle Experiment Station.

Dr. R. E. ROSE, of the chemical division of the du Pont Co. has been transferred to the dyestuff division, as assistant director of the technical laboratory.

JOHN J. RUTLEDGE has been transferred from station superintendent at St. Louis to the position of superintendent of the Urbana Experiment Station. G. J. Salmon has been designated to be acting superintendent at St. Louis.

O. V. URBAN took charge of the chemical work of the Guttenberg refinery of the American Cotton Oil Co. on June 1.

E. R. WILES has resigned his position as chief chemist of the Southern Oil Corporation to assume the position of chief chemist with the Barnsdall Refining Co., Bigheart, Okla.

J. C. WITT of the Structural Materials Research Laboratory, Chicago, recently returned from an inspection trip to the arid regions of Colorado, in connection with research on the effect of alkali on concrete.

Obituary

FRANK D. BAKER, for twenty years chief engineer for the Colorado department of the American Smelting & Refining Co., died in Denver on April 29, at the age of sixty-three, following an operation for ulcer of the stomach. During his long service with the smelter company Mr. Baker was in charge of or intimately connected with much of the metallurgical plant construction in the state, and was widely known and admired by Western metallurgical and mechanical engineers. He was the inventor of numerous metallurgical devices, of which the best known is the Baker cooler, for cooling calcined materials on a large scale. Mr. Baker was graduated in 1888 from the course in mechanical engineering at the University of Illinois. He was a member of the American Society of Mechanical Engineers and the Colorado Society of Engineers. He is survived by his wife and five children.

Colonel THOMAS CURTIS CLARKE of New York City, a metallurgical and civil engineer, died suddenly May 26 at the Roosevelt Hospital, of pneumonia following an operation. Colonel Clarke had engineering charge of special work for the Illinois Steel Co., was formerly general superintendent of the Lackawanna Iron & Steel Co., supervising engineer of the Deutsche Bank of Berlin and was a consulting engineer, located in New York City, specializing in coal and coke and its byproducts until the entry of the United States into the war. He served in the A. E. F. as Colonel of the 110th Engineers, 35th Division.

Current Market Reports

The Chemical and Allied Industrial Markets

NEW YORK, June 6, 1921.

Trade conditions have been decidedly better in the chemical market, even though the week-end holiday intervened. Business has been going along in extremely good fashion and interest from consumers seems to be growing. The strengthening of the resale market for alkalis is probably the most hopeful sign in the market. Although alkalis are being imported in good-sized quantities, the demand has increased to such an extent that prices on the spot are noticeably firming up. All general indications point to a steady improvement with the present market as a basis. The most important occurrence of the week was the pronounced advance of *caustic soda* and *soda ash* with higher prices asked despite offers from abroad of large quantities. The market on caustic opened at \$3.85 per 100 lb., and at the close there was enough odd lot buying to lift prices up to 4c. per lb. Along with these two leading chemicals has been a stronger market for bichromate of soda and potash, prussiate of soda and other items of varying importance. On the other hand, some chemicals have remained in a somewhat dormant position, with consumers still following the hand-to-mouth buying policy. Signs of improvement are apparent in many of the more important industries and it must be admitted that while there is a certain amount of this improvement taking place in basic conditions, buying confidence has been so badly shattered during the recent business depression that expansion can be along gradual lines only. Sellers feel encouraged that the long period of hand-to-mouth buying is visibly dwindling away and that shelves among the consuming element are well cleared. The tendency among leading industrial plants is to increase capacity. Soap factories are buying in freer style and glass-makers seem to be working toward a more normal output. Paper mills and tanneries are still lagging behind in production.

CHEMICALS

Resale lots of domestic *chlorate of potash* were quoted by second hands at 8½¢@9½¢. per lb., according to seller. Prime domestic material is quoted by producers at the former price of 12c. per lb., f.o.b. works. German shipments were quoted at 8½¢. per lb. The *muriatic acid* situation is extremely sluggish, with consumers contenting themselves with only minimum quantities. Makers are still holding prices at the former levels, as it is expected that consumers will sooner or later come into the market for more normal requirements. The present basis is quite close to the cost of production. Quotations on the 20 deg. are based on \$1.50@1.75 per 100 lb. Prices on *sulphuric acid* remained unchanged at recent levels, with the demand very light. Quotations on 60 deg. acid in tank cars f.o.b. works are around \$11@13 per ton. The 66 deg. strength is quoted at \$18@\$20 per ton. Demand for *oleum* has been very slow, with quoted prices for the 20 per cent in tank cars at \$22@\$25 per ton. Consumers are showing very little interest in this item. Makers of *aluminum sulphate* are quoting the iron free at \$3 per 100 lb. in the face of a very slow demand. The commercial grade could be obtained all the way down to \$1.75 per 100 lb. The market on *ammonium sulphate* continues very dull, with stocks heavy and only a few buyers in the market. Prices are subject to shading on any firm business. The spot price is around \$2.75 per 100 lb. *Bleaching powder* is very sluggish, with resale material offered at \$2.15 per 100 lb. f.o.b. works. Makers are still holding their prices around \$2.75 per 100 lb. There were only a very small number of buyers during the week. Resale lots of *carbon bisulphide* were offered on the spot down to 6c. per lb., against a producers' price of 8c. The manufacturers were given the preference, however, as resale stocks at low figures are of a limited nature. Prices on *caustic potash* remained with-

out any quotable change at former levels. The demand has been very slow. Resale caustic of American manufacture is offered around 5½¢. per lb. German caustic is held at 6½¢@7½¢. per lb. on spot.

Yellow prussiate of soda appeared firm, and dealers reported sales at 12½¢. per lb. ex-store. Shipments are offered at 12½¢. per lb. N. Y. Spot material is not so plentiful at the moment and several large sellers quote 12½¢@13c. per lb., according to quantity. Dealers of *bichromate of soda* are not willing to quote below 8c. per lb. for standard brand material and in some quarters 8½¢. is being asked. A scarcity of round lot offerings is holding the market in a firm position. Resale solid *caustic soda* reached 4c. per lb. in the late trading on all standard brands. Sales were made earlier in the week at \$3.85@ \$3.95 per 100 lb., and it was reported that some large tonnages were closed at the inside figure. Those close to the pulse of trading stated that shelves have been well cleared of resale material and some of the large dealers admitted that their surplus has been exhausted. The final offering was firm with 4c. per lb. quoted for limited quantities.

Resale light *soda ash* in single bags continued to be in limited supply on spot and dealers are holding the market at \$2.20@\$2.25 per 100 lb. At the works it was stated that small quantities of resale stock could be purchased at \$1.90@\$2 per 100 lb. Small lots of ash in barrels are moving at 2½¢. per lb. ex-store N. Y., while at the works limited quantities were quoted by second hands at 2½¢. per lb. Producers quote \$1.65 per 100 lb., basis 48 per cent, in single bags and 2c. per lb. in barrels, basis 48 per cent. Special quotations are being made for contracts, the price varying according to quantity. Prices on *carbonate of potash* are still very uncertain, with supplies rather heavy. It is possible to shade any quoted figures on either the 80-85 per cent or the 96-98 per cent material on the spot market. Quotations on the former grade are around 6c. per lb. and on the latter about 9c. per lb. The announcement of the passage of the emergency tariff measure has so far had no pronounced effect on *nitrite of soda*. Prices are around 7½¢@8c. per lb., although some factors are quoting as high as 10c. per lb. The prospect of the inclusion of a 2c. duty on nitrite in the permanent tariff will undoubtedly have a better effect than the present measure. Sales of *formaldehyde* are reported at 14½¢@14¾¢. per lb. in barrels on spot. The call is limited mostly to small lots, while in general a rather satisfactory amount of business is reported.

Considerable business of small lot nature is passing in *oxalic acid* at prices ranging from 16½¢@18c. per lb. Some sellers are not meeting these figures, but others state they are in a position to fill inquiries and say the demand is rapidly increasing.

The consuming demand for the various forms of *alcohol* still continues to be along light routine lines. Consumers are still unsettled in their ideas as to future needs and are buying only from hand to mouth. *Ethyl alcohol* is readily available in most directions and prices range from \$4.65@\$4.90 per gal. Supplies of *denatured alcohol* are easy and moving very slowly, while prices range from 31¢@42c. per gal., depending on formula. Consumers of *methanol* are not showing any interest in future needs and confine themselves to picking up small odd lots at cheap prices.

COAL-TAR PRODUCTS

The market in the coal-tar products industry presented a steady tendency during the week, but trading was confined to the usual small-lot requirements for immediate use. The speculative boom in *beta naphthol* has been the feature of the intermediate market. Trading otherwise has been spotty along more or less routine lines. Stocks of *beta naphthol* have passed into firmer hands, but it is still questionable whether they will be able to hold out until the consuming demand returns. Manufacturers now quote 40c. per lb. for *beta*, while second hands in most quarters are not far below with 38c. as their asking price. Sellers are generally quoting 85c. per lb. on *para-nitraniline* for spot goods. The tone of the market is firmer and contract busi-

ness ranges around 90@95c. per lb. *Aniline oil* is being neglected, but prices are still unchanged and range from 20@25c. per lb.

Crude prices have shown no special changes during the week, although the tone is firmer on some items, while on others irregularities are noticeable. Spot and nearby stocks of *benzene* remain uncertain. Loose lots have been pretty well cleared away by consumers and the inquiry has subsided to a great extent. Occasional lots are offered by producers at 27@33c. per gal. for the pure in tank cars and drums. The *naphthalene* market is very dormant with all quoted prices subject to shading on firm business. The resale market is quoted around 7½@8c. per lb., but it is understood that bids as low as 7c. would receive consideration. Manufacturers are still holding to their former quotations. Prices on *dimethylaniline* are still more or less irregular in the absence of any noted demand. Odd lots are to be had at 40c. per lb., with stocks in resale hands quite plentiful at 42c. per lb. Makers are quoting up to 60c. per lb. for quantities. Speculative interests have taken over practically all the *beta-naphthol* in weak hands on the spot market and are holding for 38c. per lb. Occasional bona fide inquiries came in during the flurry, but these were very few and far between. Producers are holding their stocks, which are known to be quite heavy, at 40c. per lb. and up, according to quantity. Prices on *aniline oil* are unchanged from the former weak basis. Odd lots are to be had from resellers down to 18c. per lb. Others are asking 19@20c. per lb., drums extra. Manufacturers' figures ranged from 20@25c. per lb., according to brand and quantity, but actual business would bring about better prices. Few inquiries have been noted. Prices on *sulphanilic acid* are held around 30@32c. per lb. in spite of the weakness in aniline. No stocks of any magnitude could be located, so that producers are able to maintain the price level, even though the consuming demand is far below normal.

MISCELLANEOUS MATERIALS

The movement of miscellaneous materials into consuming channels was of fair proportions, some factors reporting that the demand was quite active for such items as litharge and blanc fixe. In fact the entire list of basic materials closed the week with no decline in prices. Traders reported a good outlet for *blanc fixe* and the market at the close was steady at 4½c. per lb. asked for carlots, immediate shipment. Production has been restricted in some directions. There was a moderate inquiry for litharge, and leading interests reported the market as steady on the basis of 8½c. per lb., in casks, for immediate and nearby delivery in carlots. Smaller quantities were quoted at 8½@8¾c. per lb. With no important change in zinc ores and the demand for *zinc oxide* improving, prices ruled steady. Tire manufacturers are taking on supplies in a freer manner. Leading producers quote the market for XX grade unchanged on the basis of 9c. per lb., nearby delivery.

WAXES

A moderate inquiry was noted for *beeswax* and prices in most instances ruled steady. African crude closed at 16@17c. per lb., according to quantity and seller, with Brazilian crude at 22@24c. per lb. Pure white wax was held at 42@45c. per lb. Further irregularity was noted in prices on *carnauba wax*, offerings being quite liberal, with the demand rather quiet. No. 2 North Country was offered at 26@28c. per lb., with quotations easy. No. 3 North Country was quoted at 16@17c. per lb., with the No. 3 chalky at 17@18c. Offerings of *Japan wax* were noted on the basis of 18@18½c. per lb. spot delivery. The market was reported rather dull. The market for *paraffine wax* was quiet and prices were subject to shading where round lots were involved. Prospective buyers restricted operations to a minimum on the assumption that the weakness in crude oil and the quiet export conditions could hardly bring about much of a change in the general situation. Scale wax, 122-124 deg. melting point, closed at 2½c. per lb. for carlots. Refined, 123-125 deg. melting point, was offered at 4c. per lb., with the 130-132 deg. melting point at 5@5½c. per lb.

The Chicago Market

CHICAGO, June 4, 1921.

There was a slow but steady improvement during the past two weeks in the tone of the industrial chemical market. Nearly all of the larger factors report a better inquiry and a larger volume of orders. It is also noticeable that the buyers are demanding immediate delivery, showing that present stocks in consumers' hands are either exhausted or very low. Prices as a rule are quite firm, with a few advances. There is but little distressed material left in the local market and the manufacturers or their agents are finding a steady inquiry for their products.

GENERAL CHEMICALS

Caustic soda is quoted at a slightly lower figure, although the inquiry is good for small lots. The solid 76 per cent is offered at 4c. and the ground at 4½@4¾c. per lb. There is a fair movement of *soda ash*, and supplies are available at \$2.60 per 100 lb. for barrels. The inquiry for *aluminum sulphate* is light and it is possible to get supplies of the ground technical at 2½c. per lb. *Ammonium carbonate* is quiet and the price is unchanged at 11c. per lb. for single casks. *Sal ammoniac* is firmer, although it is still possible to obtain small lots of the white granulated at 8½c. *Ammonium sulphate* is very quiet and the technical grade is offered at 3¾c. in bags. *Barium chloride* is dull and remains unchanged at \$75@\$85 per ton, according to the quantity. A fair demand for *epsom salts* was noted in some quarters, the prevailing price being 3¼c. per lb. for the U.S.P. in barrels. *Formaldehyde* is lower, the new basis being 14½c. per lb. in barrels. The principal dealers report a fair volume of small orders and a few good inquiries.

Caustic potash remains in the same unsteady position, and ample supplies of the imported material are offered at 7½c. per lb., single casks. *Potassium permanganate* is unchanged and the inquiry is rather light. Material of foreign origin is offered at 33½@36c. per lb. *Bichromate of potash* is in a firmer position, and it is doubtful if supplies could be located at less than 15½c. per lb. *Sodium bichromate* has also shown a firmer tendency and material to arrive is offered at 9c. *Sodium bicarbonate* continues to move in a small way and dealers are maintaining prices at 2½@2¾c. per lb. *Nitrite of soda* is very firm and it is doubtful if supplies could be had at a figure lower than 8½c. There were several large inquiries for *zinc chloride* and the price was firm at 11½c. for spot material.

The general list of acids is quiet and unchanged as to price. *Glacial acetic* is very quiet, manufacturers quoting 11@11½c. per lb. The 28 per cent is moving in a fair way and is offered at 2¾@3c. per lb. for barrels. The warm weather affected the *citric acid* market and several good sales were noted. This material is offered by first hands at 47@48c. per lb., according to the size package. *Oxalic acid* is firm and quiet, foreign goods being held for 19c. in large casks and 20c. for the small barrels. *Sulphuric acid* is unchanged and makers continue to quote the 66 deg. at \$19@\$20 per ton in tank cars f.o.b. works.

VEGETABLE OILS, NAVAL STORES, COAL-TAR PRODUCTS

Quiet conditions still prevail in the vegetable oil trade and the only item worthy of attention is *linseed oil*. This material has fluctuated considerably during the past two weeks and the latest quotation noted was 85c. per gal. in barrels for the boiled and 83c. for the raw. Some factors report a fairly good volume of business.

The naval stores branch of the trade shows no signs of steadiness and prices are changing every day. *Turpentine* is now quoted at 71c. per gal. in drums and while the movement is not large, dealers are reporting an increase in orders. *Rosins* are steadier, although little or no business is reported. Prices as a rule are nominal and cover a wide range.

There was a slightly better inquiry noted for coal-tar products and dealers are hopeful of better times in the near future. Prices on *benzene* are unchanged and 31c. per gal. for the 100 per cent in drums was the best offer noted. *Toluene* is available at the same price, but the movement is slight.

The Iron and Steel Market

PITTSBURGH, June 3, 1921.

The case of the steel market seems to be that the particularly dull season usually beginning about July 1 has come a month ahead of time. In all quarters the volume of buying has decreased and in the past week the turnover has been unprecedentedly light. If the present volume of steel buying is the natural volume for an industrial depression, for a period of hard times, then the amount of business last winter was phenomenally large, although at the time it was considered very small.

The natural appraisal is that the present is a temporary condition, not characteristic of an industrial depression in general. Most business historians regard the period 1893 to 1898 inclusive as a period of industrial depression, yet three of those six years witnessed new records in pig-iron production.

Instead of being disappointed by the fresh degree of stagnation the iron and steel market now exhibits, producers are encouraged in their hope that August would witness a revival, and in most quarters the hope has turned into a definite prediction. Full activity is not expected for any time this year.

The rate of steel production has dropped to about 25 per cent of capacity, against rates of 30 or 31 per cent in April and about 80 per cent during the first nine months of last year.

One influence that has often helped in a revival in steel buying cannot be counted upon this time, and that is replenishment of buyers' stocks due to buyers acquiring the fear that prompt deliveries cannot be secured. Very prompt mill shipment is possible now, many carload orders being shipped within a day or two of their receipt, the chief cause of delay being that a mill is temporarily idle. With an increase in buying, therefore, shipments would not become less prompt.

STEEL PRICES

The ordinary transactions of the day in steel products are in carload lots, any order of larger size being more or less exceptional. On carload orders, as a rule, the steel prices developed about the middle of April are being maintained, 2.10c. for bars, 2.20c. for shapes and plates, and so on. In some commodities concessions are possible on larger orders, but in a strong and active market occasional concessions are not unknown.

Evidently all or nearly all buyers are convinced that steel prices will be lower within a short time, probably within two months. Steel producers naturally do not make definite predictions, but they show no disposition to take issue with this view. What the mills would prefer would be a reduction, perhaps a fairly heavy reduction, so timed as to stimulate a buying movement. Such a reduction could not be timed this month or in July, as buyers would take no interest. August would be different. The principle involved is that costs are particularly high now, both on account of poor distribution of overhead and on account of labor employment per ton of output being particularly heavy with so light an operation, and that an increase in buying, leading to a heavier operation, would reduce costs and thus pay for the price reduction involved.

PIG IRON AND COKE

Buying of pig iron remains of very small proportions, and with the present rate the stocks at merchant furnaces will last for several months. Carload lot sales of bessemer iron show a price of \$23 valley, against the nominal market of \$24 hitherto quoted. Basic, formerly quotable at \$22 valley, has sold at \$21.75 if not at \$21.50. Foundry is quotable at \$23 against \$23.50.

Connellsville coke for spot shipment remains at \$3.25@ \$3.50 for furnace, while foundry is down 25c., at \$4.75@ \$5.25. The Robeson Iron Co., which makes low-phosphorus pig iron, is understood to have bought a four months' supply of the low-phosphorus coke requisite, available from only about three works in the Connellsville region, at a shade under \$3.75.

Picric.....lb.	.20 -	.25	.27 -	.35
Pyrogallol, resublimed.....lb.			1.90 -	2.15
Sulphuric, 60 deg., tank cars.....ton			11.00 -	12.00
Sulphuric, 60 deg., drums.....ton			13.00 -	15.00
Sulphuric, 66 deg., tank cars.....ton	18.00 -	20.00		
Sulphuric, 66 deg., drums.....ton	22.00 -	22.50	23.00 -	23.50
Sulphuric, 66 deg., carboys.....ton				
Sulphuric, fuming, 20 per cent (oleum) tank cars.....ton	23.00 -	24.00		
Sulphuric, fuming, 20 per cent (oleum) drums.....ton	25.00 -	26.00	26.50 -	27.00
Sulphuric, fuming, 20 per cent (oleum) carboys.....ton	31.00 -	32.00	33.00 -	34.00
Tannic, U. S. P.....lb.			.90 -	1.00
Tannic (tech.).....lb.	.50 -	.52	.54 -	.57
Tartaric, crystals.....lb.			.30 -	.32
Tungstic, per lb. of WO.....lb.			1.30 -	1.40
Alcohol, Ethyl.....gal.			4.65 -	4.90
Alcohol, Methyl (see methanol).....gal.				
Alcohol, denatured, 188 proof.....gal.			.31 -	.36
Alcohol, denatured, 190 proof.....gal.			.38 -	.42
Alum, ammonia lump.....lb.	.03½ -	.04	.04 -	.04½
Alum, potash lump.....lb.	.04 -	.04½	.04½ -	.05
Alum, chrome lump.....lb.	.13 -	.13½	.14 -	.14½
Aluminum sulphate, commercial.....lb.	.01½ -	.02	.02 -	.02½
Aluminum sulphate, iron free.....lb.	.03 -	.03½	.03½ -	.04
Aqua ammonia, 26 deg., drums (750 lb.).....lb.	.07½ -	.07½	.08 -	.08½
Ammonia, anhydrous, cyl. (100-150 lb.).....lb.	.30 -	.32	.33 -	.35
Ammonium carbonate, powder.....lb.	.08 -	.08½	.09 -	.10
Ammonium chloride, granular (white salamoniac).....lb.	.06½ -	.06½	.07 -	.07½
Ammonium chloride, granular (gray salamoniac).....lb.	.07½ -	.08	.08 -	.08½
Ammonium nitrate.....lb.	.08 -	.08½	.09 -	.10
Ammonium sulphate.....100 lb.	2.50 -	2.75	2.80 -	2.90
Amylacetate.....gal.			4.00 -	4.25
Amylacetate tech.....gal.			2.50 -	3.00
Arsenic oxide, (white arsenic) powdered lb.	.07½ -	.08	.08½ -	.08½
Arsenic, sulphide, powdered (red arsenic) lb.	.12 -	.12½	.13 -	.14
Barium chloride.....ton	60.00 -	62.00	63.00 -	65.00
Barium dioxide (peroxide).....lb.	.19 -	.20	.21 -	.22
Barium nitrate.....lb.	.08½ -	.09	.09½ -	.10
Barium sulphate (precip.) (blanc fixe).....lb.	.04½ -	.05	.05½ -	.06
Bleaching powder (see calc. hypochlorite).....				
Blue vitriol (see copper sulphate).....				
Borax (see sodium borate).....				
Brimstone (see sulphur, roll).....				
Bromine.....lb.	.41 -	.42	.43 -	.45
Calcium acetate.....100 lbs.	2.00 -	2.05		
Calcium carbide.....lb.	.05½ -	.05½	.06 -	.06½
Calcium chloride, fused, lump.....ton	24.00 -	25.00	26.00 -	27.00
Calcium chloride, granulated.....lb.	.01½ -	.02	.02½ -	.02½
Calcium hypochlorite (bleach'g powder) 100lb.	2.25 -	2.40	2.50 -	2.75
Calcium peroxide.....lb.			1.40 -	1.50
Calcium phosphate, tribasic.....lb.			.15 -	.16
Camphor.....lb.			.68 -	.70
Carbon bisulphide.....lb.	.06½ -	.07	.07½ -	.08
Carbon tetrachloride, drums.....lb.	.10½ -	.10½	.11 -	.12
Carbonyl chloride (phosgene).....lb.			.75 -	1.00
Caustic potash (see potassium hydroxide).....				
Caustic soda (see sodium hydroxide).....				
Chlorine, gas, liquid-cylinders (100 lb.).....lb.	.08 -	.09	.09½ -	.10
Chloroform.....lb.			.42 -	.44
Cobalt oxide.....lb.			3.00 -	3.10
Copperas (see iron sulphate).....				
Copper carbonate, green precipitate.....lb.	.20 -	.21	.22 -	.23
Copper cyanide.....lb.			.50 -	.62
Copper sulphate, crystals.....lb.	.05½ -	.05½	.06 -	.06½
Cream of tartar (see potassium bitartrate).....				
Epsom salt (see magnesium sulphate).....				
Ethyl Acetate Com. 85%.....gal.			1.00 -	1.05
Ethyl Acetate pure (acetic ether 98% to 100%).....lb.			.50 -	.52
Formaldehyde, 40 per cent.....lb.	.14½ -	.14½	.15 -	.15½
Fusel oil, ref.....gal.			3.00 -	3.25
Fusel oil, crude.....gal.			1.75 -	2.00
Glauber's salt (see sodium sulphate).....				
Glycerine, C. P. drums extra.....lb.			.16½ -	.17
Iodine, resublimed.....lb.			3.65 -	3.75
Iron oxide, red.....lb.			.10 -	.20
Iron sulphate (copperas).....100 lb.	1.00 -	1.25	1.50 -	1.75
Lead acetate.....lb.			.11½ -	.13
Lead arsenate, paste.....lb.	.09 -	.09½	.10 -	.11
Lead nitrate.....lb.			.15 -	.20
Litharge.....lb.	.38½ -	.08½	.08½ -	.09
Lithium carbonate.....lb.			1.30 -	1.40
Magnesium carbonate, technical.....lb.	.09 -	.09½	.10 -	.11
Magnesium sulphate, U. S. P.....100 lb.	2.75 -	3.00		
Magnesium sulphate, technical.....100 lb.			1.10 -	2.25
Methanol, 95%.....gal.			.75 -	.77
Methanol, 97%.....gal.			.78 -	.82
Nickel salt, double.....lb.			.14 -	.14½
Nickel salt, single.....lb.			.15 -	.15½
Phosgene (see carbonyl chloride).....				
Phosphorus, red.....lb.	.45 -	.46	.47 -	.50
Phosphorus, yellow.....lb.			.35 -	.37
Potassium bichromate.....lb.	.12 -	.12½	.12½ -	.13

	Carlots	Less Carlots
Potassium bitartrate (cream of tartar)..... lb.	\$.31 — .32	
Potassium bromide, granular..... lb.	.16 — .25	
Potassium carbonate, U. S. P..... lb.	.35 — .40	.45 — .50
Potassium carbonate, 80-85%..... lb.	.06 — .06½	.06½ — .07½
Potassium chlorate, crystals..... lb.	.08½ — .10	.10½ — .14
Potassium cyanide..... lb.	.26 — .28	
Potassium hydroxide (caustic potash)..... lb.	.05½ — .05¾	.06 — .08
Potassium muriate..... ton	50.00 — 53.00	
Potassium iodide..... lb.	2.75 — 3.00	
Potassium nitrate..... lb.	.09½ — .09¾	.10 — .12½
Potassium permanganate..... lb.	.35 — .36	.37 — .38
Potassium prussiate, red..... lb.	.35 — .37	.38 — .40
Potassium prussiate, yellow..... lb.	.26 — .26½	.27 — .28
Potassium sulphate (powdered)..... per unit	1.50 — 1.75	
Rochelle salts (see sodium potas. tartrate).....		
Sal ammoniac (see ammonium chloride).....		
Salt soda (see sodium carbonate).....		
Salt cake..... ton	32.00 — 33.00	
Silver cyanide..... oz.	1.35 — 1.38	
Silver nitrate..... oz.	.40 — .41	
Soda ash, light..... 100 lb.	2.20 — 2.25	2.30 — 2.70
Soda ash, dense..... 100 lb.	2.45 — 2.50	2.60 — 2.75
Sodium acetate..... lb.	.04½ — .04¾	.05 — .05½
Sodium bicarbonate..... 100 lb.	2.25 — 2.40	2.50 — 2.75
Sodium bichromate..... lb.	.08 — .08½	.08½ — .09
Sodium bisulphate (nitre cake)..... ton	5.00 — 5.25	5.50 — 6.50
Sodium bisulphite powdered, U.S.P..... lb.	.05½ — .05¾	.05¾ — .06½
Sodium borate (borax)..... lb.	.06½ — .06¾	.07 — .07½
Sodium carbonate (sal soda)..... 100 lb.	1.90 — 2.00	2.10 — 2.40
Sodium chlorate..... lb.	.07½ — .07¾	.08 — .08½
Sodium cyanide..... lb.	.22 — .24	.25 — .30
Sodium fluoride..... lb.	.12 — .12½	.13 — .14
Sodium hydroxide (caustic soda)..... 100 lb.	4.00 — 4.05	4.10 — 4.50
Sodium hyposulphite..... lb.	.03½ — .03¾	
Sodium nitrate..... 100 lb.	2.90 — 3.00	
Sodium nitrite..... lb.	.07½ — .08	.08½ — .10
Sodium peroxide, powdered..... lb.	.25 — .26	.27 — .30
Sodium phosphate, dibasic..... lb.	.04½ — .04¾	.05 — .05½
Sodium potassium tartrate (Rochelle salts) lb.	.26 — .27	
Sodium prussiate, yellow..... lb.	.12½ — .13	.13½ — .14
Sodium silicate, solution (40 deg.)..... lb.	1.25 — 1.35	1.40 — 1.50
Sodium silicate, solution (60 deg.)..... lb.	.02½ — .03	.03½ — .03¾
Sodium sulphate, crystals (Glauber's salt) 100 lbs.	1.50 — 1.75	2.00 — 2.25
Sodium sulphide, fused, 60-62 per cent (conc.) lb.	.05 — .05½	.06 — .06½
Sodium sulphite, crystals..... lb.	.03 — .04	.04½ — .04¾
Strontium nitrate, powdered..... lb.	.15 — .15½	.16 — .17
Sulphur chl. ride, red..... lb.	.07 — .07½	.07½ — .08
Sulphur, crude..... ton	20.00 — 22.00	
Sulphur dioxide, liquid, cylinders extra..... lb.	.08 — .08½	.09 — .10
Sulphur (sublimed), flour..... 100 lb.	2.25 — 3.10	
Sulphur, roll (brimstone)..... 100 lb.	2.00 — 2.75	
Tin bichloride, 50 per cent..... lb.	.18 — .19	
Tin oxide..... lb.	.40 — .42	
Zinc carbonate, precipitate..... lb.	.16 — .18	.19 — .20
Zinc chloride, gran..... lb.	.11 — .11½	.11½ — .12
Zinc cyanide..... lb.	.45 — .49	.50 — .60
Zinc dust..... lb.	.12 — .13	.13½ — .14
Zinc oxide, XX..... lb.	.09 — .09½	.09½ — .10
Zinc sulphate..... lb.	.03½ — .03¾	.04 — .05

Coal-Tar Products

NOTE—The following prices are for original packages in large quantities:

Alpha-naphthol, crude..... lb.	\$1.10 — \$1.15
Alpha-naphthol, refined..... lb.	1.25 — 1.30
Alpha-naphthylamine..... lb.	.35 — .40
Aniline oil, drums extra..... lb.	.19 — .25
Aniline salts..... lb.	.26 — .29
Anthracene, 80% in drums (100 lb.)..... lb.	.75 — 1.00
Benzaldehyde U.S.P..... lb.	1.50 —
Benzidine, base..... lb.	.85 — 1.00
Benzidine sulphate..... lb.	.75 — .85
Benzoic acid, U.S.P..... lb.	.60 — .65
Benzoate of soda, U.S.P..... lb.	.65 — .70
Benzene, pure, water-white, in drums (100 gal.) gal.	.27 — .32
Benzene, 90%, in drums (100 gal.)..... gal.	.25 — .28
Benzyl chloride, 95-97%, refined..... lb.	.28 — .30
Benzyl chloride, tech..... lb.	.20 — .25
Beta-naphthol benzoate..... lb.	3.50 — 4.00
Beta-naphthol, sublimed..... lb.	.70 — .75
Beta-naphthol, tech..... lb.	.38 — .40
Beta-naphthylamine, sublimed..... lb.	2.00 — 2.25
Cresol, U. S. P., in drums (100 lb.)..... lb.	.16 — .18
Ortho-cresol, in drums (100 lb.)..... lb.	.25 — .27
Cresylic acid, 97-99%, straw color, in drums..... gal.	.70 — .80
Cresylic acid, 95-97%, dark, in drums..... gal.	.65 — .70
Cresylic acid, 50%, first quality, drums..... gal.	.45 — .50
Dichlorobenzene..... lb.	.06 — .09
Diethylaniline..... lb.	1.20 — 1.25
Dimethylaniline..... lb.	.41 — .50
Dinitrobenzene..... lb.	.32 — .35
Dinitrochlorobenzene..... lb.	.20 — .30
Dinitronaphthalene..... lb.	.30 — .40
Dinitrophenol..... lb.	.35 — .40
Dinitrotoluene..... lb.	.27 — .30
Dip oil, 25%, car lots, in drums..... gal.	.40 — .45
Diphenylamine..... lb.	.60 — .65
H-acid..... lb.	1.25 — 1.35
Meta-phenylenediamine..... lb.	1.15 — 1.20
Monochlorobenzene..... lb.	.12 — .14
Monoethylaniline..... lb.	1.75 — 1.85
Naphthalene crushed, in bbls..... lb.	.07 — .08½
Naphthalene, flake..... lb.	.07 — .08½
Naphthalene, balls..... lb.	.08 — .09½
Naphthionic acid, crude..... lb.	.70 — .75
Nitrobenzene..... lb.	.12 — .15
Nitro-naphthalene..... lb.	.30 — .35
Nitro-toluene..... lb.	.16 — .18
Ortho-amidophenol..... lb.	3.10 — 3.20
Ortho-dichlor-benzene..... lb.	.15 — .20
Ortho-nitro-phenol..... lb.	.80 — .85
Ortho-nitro-toluene..... lb.	.15 — .20
Ortho-toluidine..... lb.	.20 — .25
Para-amidophenol, base..... lb.	1.50 — 1.60
Para-amidophenol, HCl..... lb.	1.75 — 1.80

Para-dichlorobenzene..... lb.	.15 — .20
Paranitroaniline..... lb.	.85 — 1.00
Para-nitrotoluene..... lb.	.90 — 1.00
Para-phenylenediamine..... lb.	1.95 — 2.00
Para-toluidine..... lb.	1.25 — 1.40
Phthalic anhydride..... lb.	.50 — .60
Phenol, U. S. P., drums..... lb.	.09 — .12
Pyridine..... gal.	2.00 — 3.50
Resorcinol, technical..... lb.	1.75 — 1.85
Resorcinol, pure..... lb.	2.25 — 2.30
Salicylic acid, tech., in bbls..... lb.	.22 — .24
Salicylic acid, U. S. P..... lb.	.26 — .28
Salol..... lb.	.80 — .85
Solvent naphtha, water-white, in drums, 100 gal..... gal.	.25 — .28
Solvent naphtha, crude, heavy, in drums, 100 gal..... gal.	.14 — .16
Sulphanilic acid, crude..... lb.	.30 — .35
Tolidine..... lb.	1.25 — 1.35
Toluidine, mixed..... lb.	.40 — .45
Toluene, in tank cars..... gal.	.25 — .28
Toluene, in drums..... gal.	.28 — .31
Xylidines, drums, 100 gal..... lb.	.40 — .45
Xylene, pure, in drums..... gal.	.40 — .45
Xylene, pure, in tank cars..... gal.	.45 — .50
Xylene, commercial, in drums, 100 gal..... gal.	.33 — .35
Xylene, commercial, in tank cars..... gal.	.30 —

Waxes

Prices based on original packages in large quantities.

Beeswax, refined, dark..... lb.	\$0.23 — \$0.25
Beeswax, refined, light..... lb.	.25 — .27
Beeswax, white pure..... lb.	.42 — .45
Carnauba, Florida..... lb.	.61 — .62
Carnauba, No. 2, North Country..... lb.	.27 — .28
Carnauba, No. 3, North Country..... lb.	.16 — .17
Japan..... lb.	.18 — .18½
Montan, crude..... lb.	.07 — .07½
Paraffine waxes, crude match wax (white) 105-110 m.p..... lb.	.03½ — .03¾
Paraffine waxes, crude, scale 124-126 m.p..... lb.	.02½ — .03
Paraffine waxes, refined, 118-120 m.p..... lb.	.03½ — .03¾
Paraffine waxes, refined, 125 m.p..... lb.	.04 — .04½
Paraffine waxes, refined, 128-130 m.p..... lb.	.04 — .05
Paraffine waxes, refined, 133-135 m.p..... lb.	.05 — .05½
Paraffine waxes, refined, 135-137 m.p..... lb.	.05½ — .06
Stearic acid, single pressed..... lb.	.09½ —
Stearic acid, double pressed..... lb.	.10 —
Stearic acid, triple pressed..... lb.	.11 — .11½

Naval Stores

All prices are f.o.b. New York unless otherwise stated, and are based on carload lots. The oils in 50-gal. bbls., gross weight, 500 lb.

Rosin B-D, bbl..... 280 lb.	\$5.00 —
Rosin E-I..... 280 lb.	5.80 — 6.00
Rosin K-N..... 280 lb.	6.50 — 6.70
Rosin W. G.-W. W..... 280 lb.	6.80 —
Wood rosin, bbl..... 280 lb.	6.25 —
Spirits of turpentine..... gal.	.61 —
Wood turpentine, steam dist..... gal.	.59 —
Wood turpentine, dest. dist..... gal.	.57 —
Pine tar pitch, bbl..... 200 lb.	— 6.75
Tar, kiln burned, bbl. (500 lb.)..... bbl.	— 12.00
Retort tar, bbl..... 500 lb.	— 12.00
Rosin oil, first run..... gal.	.36 —
Rosin oil, second run..... gal.	.38 —
Rosin oil, third run..... gal.	.43 —
Pine oil, steam dist., sp.gr. 0.930-0.940..... gal.	\$1.80
Pine oil, pure, dest. dist..... gal.	1.50
Pine tar oil, ref., sp.gr. 1.025-1.035..... gal.	.46
Pine tar oil, crude, sp.gr. 1.025-1.035 tank cars f.o.b. Jacksonville, Fla..... gal.	.35
Pine tar oil, double ref., sp.gr. 0.965-0.990..... gal.	.75
Pine tar, ref., thin, sp.gr. 1.080-1.060..... gal.	.35
Turpentine, crude, sp. gr. 0.900-0.970..... gal.	1.20
Hardwood oil, f.o.b. Mich., sp.gr. 0.960-0.990..... gal.	.35
Pinewood creosote, ref..... gal.	.52

Solvents

73-76 deg., steel bbls. (85 lb.)..... gal.	\$0.41
70-72 deg., steel bbls. (85 lb.)..... gal.	.39
68-70 deg., steel bbls. (85 lb.)..... gal.	.38
V. M. and P. naphtha, steel bbls. (85 lb.)..... gal.	.30

Crude Rubber

Para-Upriver fine..... lb.	\$0.16 — .17
Upriver coarse..... lb.	.09 — .09½
Upriver caocho ball..... lb.	1.1½ — 1.2
Plantation—First latex crepe..... lb.	.17 —
Ribbed smoked sheets..... lb.	.15 — .15½
Brown crepe, thin, clean..... lb.	.15 —
Amber crepe No. 1..... lb.	.17 —

Oils

VEGETABLE

The following prices are f.o.b. New York for carload lots.

Castor oil, No. 3, in bbls..... lb.	\$0.08½ — \$0.09½
Castor oil, AA, in bbls..... lb.	.10 — .10½
China wood oil, in bbls. (f.o.b. Pac. coast)..... lb.	.12 — .12½
Cocoonut oil, Ceylon grade, in bbls..... lb.	.10½ — .10¾
Cocoonut oil, Cochon grade, in bbls..... lb.	.11½ — .11¾
Corn oil, crude, in bbls..... lb.	.07½ — .08
Cottonseed oil, crude (f. o. b. mill)..... lb.	.05 — .05½
Cottonseed oil, summer yellow..... lb.	.07½ — .07¾
Cottonseed oil, winter yellow..... lb.	.08 —
Linseed oil, raw, car lots (domestic)..... gal.	.73 — .73
Linseed oil, raw, tank cars (domestic)..... gal.	.67 —
Linseed oil, in 5-bbl lots (domestic)..... gal.	.76 — .76

Olive oil, Denatured.....	gal.	\$1.35	—	\$1.50
Palm, Lagos.....	lb.	.07 ¹ / ₈	—	.07 ¹ / ₄
Palm, Niger.....	lb.	.05 ³ / ₄	—	.06
Peanut oil, crude, tank cars (f.o.b. mill).....	lb.	.06	—	.06 ¹ / ₂
Peanut oil, refined, in bbls.....	lb.	.10 ¹ / ₂	—	.10 ³ / ₄
Rapeseed oil, refined in bbls.....	gal.	.86	—	.88
Rapeseed oil, blown, in bbls.....	gal.	.92	—	.94
Soya bean oil (Manchurian), in bbls. N. Y.....	lb.	.07 ³ / ₄	—	
Soya bean oil, tank cars, f.o.b., Pacific coast.....	lb.	.05 ³ / ₄	—	

FISH

Light pressed menhaden.....	gal.	\$0.40	—	\$0.41
Yellow bleached menhaden.....	gal.	.42	—	
White bleached menhaden.....	gal.	.44	—	
Blown menhaden.....	gal.	.80	—	

Miscellaneous Materials

All f.o.b. New York Unless Otherwise Stated

Barytes, ground, white, f.o.b. Kings Creek, S. C.....	net ton	\$24.00	—	30.00
Barytes, ground, off color, f.o.b. Kings Creek.....	net ton	22.00	—	26.00
Barytes, crude, 88% @ 94% ba., Kings Creek.....	net ton	10.00	—	1.00

Industrial

Financial, Construction and Manufacturers' News

Construction and Operation

Alabama

DOTHAN—The Home Guano Co. is planning for the rebuilding of its fertilizer manufacturing plant, recently destroyed by fire. A complete new machinery installation will be made, including considerable transmission equipment as pulleys, hangers, gearing, etc. M. L. Hanahan is treasurer and general manager.

Alberta

EDMONTON—The Imperial Oil Co. is planning for the construction of a new oil refinery near Fort Norman, Alta.; operations will be concentrated in a large measure to gasoline production at the new works.

Arkansas

MENA—The Cora C. Mining Co., is planning for the installation of considerable new machinery at its manganese properties in the vicinity of Hatten, Ark. The company has a tract of about 600 acres of land in this section. J. D. Budd is president and general manager.

LITTLE ROCK—The Rose City Petroleum Co., 407 Donaghey Bldg., has awarded a contract to Edwards & Dore, Little Rock, for the erection of its proposed new oil refinery, estimated to cost about \$55,000, and of which amount approximately \$25,000 will be expended for machinery. The plant will have an initial output of about 1,000 bbl. of oil per day. The company was recently incorporated with a capital of \$500,000. E. B. Fowler is secretary and treasurer.

EL DORADO—The Transcontinental Oil Co., Tulsa, Okla., is considering the construction of a new oil refinery in the vicinity of El Dorado.

California

VISALIA—The Central Counties Gas Co. has plans under way for extensions and improvements in its local gas plant, to cost about \$150,000, with machinery. The work will include new generating equipment, gas holder apparatus, etc.

Colorado

DENVER—The Radium Co. of Colorado and the Carnotite Products Co. have been merged under the name of the first noted organization. Headquarters will be maintained at Denver, and it is said that plant facilities will be increased.

Delaware

WILMINGTON—The United States Flashless Powder Co. is reported to be planning for the rebuilding of the several units at its plant, recently destroyed by fire. An official estimate of the loss has not been made.

Florida

TAMPA—The Southern Glass Mfg. Co. has plans under way for the construction of a new glass-manufacturing plant in the vicinity of Bartow, Fla., to be 1-story, 60 x 148 ft., with wing extension 36 x 100 ft.

Georgia

ATLANTA—The J. M. Tull Rubber & Supply Co., 84 North Pryor St., has awarded a contract to A. K. Adams & Co., Grant Bldg., for the construction of a new 2-story and basement plant. J. M. Tull is president and general manager.

SANDERSVILLE—The Sandersville Cotton Oil Mill is planning for the rebuilding of the portion of its plant destroyed by fire, May 20, with loss estimated at about \$100,000, including machinery.

Illinois

CHICAGO—The Advanced Forging & Tool Co., 35 South Dearborn St., has had plans prepared for the construction of a new 1- and 2-story plant at Central Park, near Addison St.

Indiana

COLUMBUS—The Indiana Oil Refining Co. has taken bids for the construction of its proposed new oil refinery on a local site, estimated to cost about \$500,000, with machinery. Preliminary work has recently been placed under way, including foundations for stills, condensers and other equipment. It is proposed to have the plant ready for operation in November.

Kansas

KANSAS CITY—The Kansas City Foundry Co., manufacturer of small metal castings, will defer the erection of the proposed 1-story addition to its foundry, 65 x 130 ft., at Water and Walker Sts. It is planned to build the structure early in the fall. E. C. Austin is secretary.

Maryland

BALTIMORE—The American Steel Rolling Co., 1203 North Charles St., is considering the construction of a new plant at Eighth and Monument Sts., for the manufacture of iron and steel rods and other rolled steel specialties. The plant will be electrically operated in the different departments, and will include a small open-hearth furnace. It is proposed to develop an initial annual capacity of about 15,000 tons of material, which will be increased at a later date. R. S. Baldwin is general manager.

BALTIMORE—The American Sugar Refining Co. has filed plans for the construction of a new 1-story brick and steel building, at Woodall and Clement Sts., 107 x 405 ft., to be used in connection with its new plant at this location.

Massachusetts

WORCESTER—The American Steel & Wire Co. has completed foundation work for its proposed new plant at its South Works, and will handle the erection of the superstructure by day labor. The plant will be 3-story, 144 x 120 ft., brick, steel and reinforced concrete, and is estimated to cost about \$150,000, with equipment.

FRAMINGHAM—The Dennison Mfg. Co., manufacturer of paper products, has construction under way on its proposed new 4-story and basement addition, 70 x 100 ft. The Aberthaw Construction Co., 27 School St., Boston, is the building contractor.

Maine

RUMFORD—The Rumford Pulp Products Co. has acquired a local mill, formerly used for magnesia production, and will remodel the structure for a new works for the manufacture of pulp products in the form of leatherboard specialties. Machinery for production will be installed at an early date.

Michigan

BAY CITY—The Wildman Rubber Co. has awarded a contract to the Bay City Stone Co. for the construction of the first unit of its new local plant, to be used for the manufacture of automobile tires and tubes, and other rubber products. The works will be 3-story and basement, 161 x 365 ft. It will be equipped for a production of about 2,500 automobile tires and 5,000 tubes per day. With the erection of additional units it is proposed to increase this capacity to an output of 50,000 tires and 100,000 tubes daily. W. W. Wildman is president.

GRAND RAPIDS—The E. S. Kiefer Tanning Co., Front St., is planning for the construction of a three-story addition to its tannery, 30 x 40 ft., estimated to cost close to \$20,000.

NILES—The French Paper Co. is planning for a number of extensions and improvements at its plant. A new power house will be erected.

ROCKWOOD—The Ford Motor Co. has commenced the installation of machinery at its new local plant, to be used for the manufacture of glass products for automobile service.

Montana

GREAT FALLS—The Anaconda Copper Mining Co., Anaconda, Mont., is considering the establishment of a new plant in the vicinity of Great Falls, for the manufacture of insulated copper wire products.

Nebraska

BURNHAM—The Burnham Brick Co. is considering the rebuilding of its local plant, partially destroyed by fire, May 16, with loss estimated at about \$100,000, including machinery.

New Jersey

MILLVILLE—The Millville Pulp and Pine Products Corp., 218-20 Walnut St., Philadelphia, Pa., E. H. Hulst, president, is completing plans for the erection of its proposed new 1- and 2-story plant at Millville and Cumberland Roads, Millville. Bids for erection will be asked at an early date.

New York

NEW YORK—The Atlantic Gulf Oil Corp., 11 B'way., is planning for the operation of its new oil refinery at Southampton, England, now nearing completion, during the present month. The plant will be operated in the name of its subsidiary organization, the Atlantic Gulf Petroleum Corp. It will have an initial daily capacity of 3,500 bbl., and this output will be increased later to about 5,000 bbl. per day maximum. The new plant will represent an investment in excess of \$3,000,000. Franklin D. Mooney is president of the parent corporation.

Oklahoma

PONCA CITY—W. K. Moore and D. J. Donahoe, Ponca City, are organizing a company to establish a local plant for the manufacture of bricks and other burned clay products.

ONETA—The Oneta Refining Co., recently organized with a capital of \$250,000, is considering plans for the construction of a new oil-refining plant in the vicinity of Pine Bluff, Ark. Henry Miers, Oneta, is one of the heads of the company.

Oregon

PORTLAND—The Portland Vegetable Oil Mills, Inc., has filed plans for the construction of the initial unit of its proposed new plant at North Portland, to cost about \$150,000, including machinery.

Pennsylvania

PHILADELPHIA—The General Smelting Co., Stock Exchange Bldg., is taking bids for the erection of a new chemical plant at Bath and Westmoreland Sts., Emile G. Perrot, 329 South Broad St., is architect.

Tennessee

CHATTANOOGA—The Signal Mountain Cement Co. has taken bids for the construction of a new cement manufacturing plant, estimated to cost about \$200,000, with machinery.

Texas

FORT WORTH—The Edmonds Oil & Refining Co. has plans under way for additions in its oil refinery at Riverside, near Fort Worth, to increase the daily capacity from 2,000 to 3,000 bbl.

SAN ANTONIO—The Gulf Portland Cement Assn., 812 Gibbs Bldg., recently organized with a capital of \$3,000,000, is perfecting plans for the construction of its proposed new plant in the vicinity of Castroville, Tex. The new plant is estimated to cost in excess of \$500,000. W. S. Campbell is president and general manager.

THREE RIVERS—The Three Rivers Glass Co., recently organized, will soon commence the construction of a new plant for the manufacture of glass products. It is proposed to have the plant ready for operation early in the fall.

TEXAS CITY—The Bennett Petroleum Co., Houston, Tex., is planning for the construction of a new petroleum plant in the vicinity of Texas City, to cost about \$100,000 with equipment. The company has a 12-acre site in this district.

BRECKENRIDGE—The Absorption Gas Products Co. has plans under way for the establishment of a chain of plants for gasoline absorption operations. The initial works will be located in the vicinity of Breckenridge, and will have a capacity of 7,000,000 cu.ft. C. C. McCandless is engineer.

West Virginia

WILLIAMSON—The Williamson Red Brick Co. has commenced the erection of

additions to its plant for increased production. New equipment will be installed.

PARKERSBURG—The Davis-Wolfe Oil Co., recently incorporated with a capital of \$100,000, has taken bids for the construction of a new local works, for the production of petroleum and petroleum byproducts. Robert E. Davis, Box 611, heads the company.

New Companies

THE SUPERIOR BRASS WORKS, INC., Detroit, Mich., has been incorporated with a capital of \$40,000 to manufacture brass and bronze castings and other kindred metal products. The incorporators are Frank M. Klump, Bedford, O.; Carl W. Thurmes and John M. Burke, 262 Chalmers Ave., Detroit.

H. C. BEBBINGTON & Co., INC., Trenton, N. J., has been incorporated with a capital of \$100,000 to manufacture steel products. The incorporators are Herbert W. Backes, C. T. and Harry C. Bebbington, 221 East Hanover St., Trenton.

THE CARBONIZED FIBER PRODUCTS CORP., New York City, has been incorporated with a capital of \$110,000 to manufacture fiber specialties. The incorporators are J. A. Boegman, W. R. Respass and L. F. Stumpf, 233 B'way.

F. P. LARMOYEAUX & SON, INC., Clarksburg, W. Va., has been incorporated with a capital of \$10,000 to manufacture glass products. The incorporators are Felix Larmoyeaux, Isa W. Monroe and G. H. Duthrie, Clarksburg.

THE J. A. C. PRODUCTION CO., 48½ North Vermilion St., Danville, Ill., has been incorporated with a capital of \$50,000 to manufacture refined oil products. The incorporators are C. W. Ames, G. H. Schultz and D. W. Osbern.

THE INTERNATIONAL MICA CO., Chicago, Ill., has been incorporated under Delaware laws with a capital of \$250,000 to manufacture mica products. The company is represented by William J. Dole, 140 North Dearborn St., Chicago.

THP PORTLAND MFG. CORP., New York City, has been incorporated with a capital of \$55,000 to manufacture paints, varnishes, etc. The incorporators are A. Oberbeck, C. Flathman and P. Gross, 302 B'way.

THE CHARLESTON EXTRACT CO., Charleston, W. Va., has been incorporated with a capital of \$200,000 to manufacture chemical products. The incorporators are E. B. Brown and O. P. Fitzgerald, Charleston.

THE ALBALOID NOVELTY CO., Newark, N. J., has been incorporated with a capital of \$100,000 to manufacture composition products. The incorporators are Henry Stuhler, Max M. Albach and Joseph Sobel, 55 New Jersey Railroad Ave.

THE WEISS OIL CORP., 220 South State St., Chicago, Ill., has been incorporated with a capital of 2,500 shares of stock, no par value, to manufacture oil products. The incorporators are Harry L. Meyers, H. Latzar and Edwin P. Swatek.

THE AMERICAN SOAP POWDER WORKS, Brooklyn, N. Y., has been incorporated with a capital of \$20,000, to manufacture soaps and kindred products. The incorporators are G. Silkworth, J. Leon and H. W. Van Alen, 215 Montague St., Brooklyn.

THE GULFTEX REFINING CO., Dallas, Tex., has been incorporated with a capital of \$100,000, to manufacture refined oil products. The incorporators are William White and Russell Reynolds, Dallas.

THE CLIMAX RUBBER CO. OF N. J., Newark, has been incorporated with a capital of \$1,000,000 to manufacture rubber goods. The incorporators are William J. Gilberts, Warner S. Rexford and J. Phillips Tarr, 120 Firemen's Bldg., Newark.

THE PERSSON LABORATORIES, Mount Clemens, Mich., has been incorporated with a capital of \$50,000, to manufacture chemicals and chemical byproducts. The incorporators are John H. Collins, Detroit; William T. Kelly and Gustaf A. Persson, Mount Clemens.

THE CHARLES MCADAM CO., Chicago, Ill., has been incorporated under Delaware laws with a capital of \$500,000 to manufacture paints, varnishes, etc. The company is represented by A. E. Manheimer, 10 South LaSalle St., Chicago.

THE C. E. ROGERS BRASS FOUNDRY CO., 64 Plympton St., Boston, Mass., has been organized by the estate of C. E. Rogers, to manufacture brass and bronze castings.

THE ELIZABETH DYE & CHEMICAL CORP., Elizabeth, N. J., has been incorporated with a capital of \$250,000, to manufacture chemicals, dyes and affiliated products. The

incorporators are James W. Roper, W. S. Knowlton and Dr. Paul Straus, Elizabeth.

THE MUTUAL PETROLEUM CORP., Adrian, Mich., has been incorporated with a capital of \$25,000, to manufacture refined mineral oil products. The incorporators are Charles A. Shierson, William E. Shierson and Rolland C. Rothfuss, Adrian.

THE GENERAL CHINAWARE CORP., New York City, has been incorporated with a capital of \$850,000, to manufacture china-ware products. The incorporators are Charles G. Atwood, William Hardman and Lewis H. Rogers, New York. The company is represented by Leonard E. Wales, Equitable Bldg., Wilmington, Del.

THE RESERVE PETROLEUM CO., Tulsa, Okla., has been incorporated with a capital of \$100,000, to manufacture petroleum products. The incorporators are J. R. Hill, Tulsa; and J. L. Kimmerl, Muskogee, Okla.

THE CONSOLIDATED PAPER CO., Monroe, Mich., has filed notice of organization to manufacture paper products. The company is headed by John C. Bulis, I. A. Newcomer and Albert H. Lockwood, Monroe.

THE PERRY & DERRICK CO., Dayton, Ky., has been incorporated with a capital of \$30,000, to manufacture paints, varnishes, etc. The incorporators are A. J. Grosser and F. J. Derrick, Dayton.

THE MAR-BELL PRODUCTS CO., Asbury Park, N. J., has been incorporated with a capital of \$100,000, to manufacture lime, cement and affiliated products. The incorporators are Ira A. Clayton, Joseph P. Watson and Joseph G. McDonough, 500 Main St., Asbury Park.

THE EL DORADO REFINING CO., El Dorado, Ark., has been incorporated with a capital of \$60,000, to manufacture refined oil products. The incorporators are W. J. Brown and William Wood, El Dorado.

THE AMERICAN LYSOFORM CO., New York City, has been incorporated with a capital of \$10,000, to manufacture chemicals, drugs and kindred products. The incorporators are C. H. Stange, H. W. Richter and J. M. Clark. The company is represented by Katz & Summerich, 120 B'way.

THE GLOBE MFG. CO., Worcester, Mass., has been incorporated with a capital of \$20,000, to manufacture celluloid and composition products. The incorporators are Henry and Simon Silverman and Samuel Wolfson, 54 Jackson St.

THE MACDOUGAL PROCESS CO., Niagara Falls, N. Y., has been incorporated with a capital of \$200,000, to manufacture electrochemical products. The incorporators are J. G. Rowe, R. H. Bennett and A. J. MacDougall. The company is represented by Kellogg, Babcock & Sullivan, Buffalo.

THE H. J. FLEMING PAPER CO., Philadelphia, Pa., has been organized by Harry J. Fleming, Frank C. Sayre and Harry R. Axelroth, 416 Walnut St., to manufacture paper products. H. J. Fleming, 1630 Pine St., is treasurer.

THE DUZ CO., New York City, has been incorporated with a capital of \$175,000 to manufacture washing and cleansing powders, and kindred chemical specialties. The incorporators are C. A. True, A. G. Thorne and M. E. Graef, 68 Winfield Ave., Jersey City, N. J.

THE UNION BRONZE CO., Reading, Pa., has been incorporated with a capital of \$50,000, to manufacture brass, bronze and kindred metal products. Robert P. Fritch, Reading, is treasurer.

THE EL DORADO OIL CORP., Paragould, Ark., has been incorporated with a capital of \$100,000, to manufacture oil products. The incorporators are H. S. Trice and W. G. Graves, Paragould.

THE CALIFORNIA GYPSUM CO., Los Angeles Cal., has been incorporated with a capital of \$1,500,000, to manufacture gypsum products. The incorporators are E. P. Wiley, Edwin K. Alpaugh, San Gabriel, Cal.; and C. H. S. Russell, Culver City, Cal.

THE DOMINO SHORTENING CO., 1615 First National Bank Bldg., Chicago, Ill., has been organized to manufacture oils, compounds and affiliated products. The company is headed by H. A. Timmins, E. S. Waterbury and M. E. Smith.

THE M. & M. OIL CO., Buffalo, N. Y., has been incorporated with a capital of \$30,000, to manufacture refined oil products. The incorporators are G. P. Manning and C. P. MacArthur, Jr. The company is represented by Penney, Killen & Nye, Ellicott Sq., Buffalo.

THE ROBINSON LIME CO., Winchester, Tenn., has been incorporated with a capital of \$250,000, to manufacture lime and kindred products. The incorporators are

Arthur J. Robinson, C. G. Ferris and W. S. Claiborne.

THE DERRICK OIL CORP., Jamestown, N. Y., has been incorporated with a capital of \$100,000, to manufacture petroleum products. The incorporators are W. J. Olson, H. S. Holmes and C. E. Nelson. The company is represented by R. H. Jackson, Jamaica, L. I.

Capital Increases, etc.

THE IMPERIAL PAINT CO., 80 Tenth St., Long Island City, N. Y., has filed notice of increase in capital from \$50,000 to \$100,000.

THE BOHEMIA BRICK & TILE CO., Houston, Tex., has filed notice of increase in capital from \$125,000 to \$250,000. A. T. Eddington is head.

THE PERFECTION TIRE & RUBBER CO., Marquette, Bldg., Chicago, Ill., operating a plant at Fort Madison, Ia., has filed notice of increase in capital from \$15,000,000 to \$20,000,000.

THE CARTERET OIL CO., Jersey City, N. J., has filed notice of increase in capital from \$1,500,000 to \$1,750,000.

THE BRADFORD-BROWN PAINT CO., Houston, Tex., has filed notice of increase in capital to \$40,000.

THE WORCESTER ABRASIVE CO., a Delaware corporation, has filed notice of organization to operate in New York, with a capital of \$300,000. H. S. Holmes, 1664 B'way., represents the company.

THE BROOKLYN FOUNDRY CO., INC., Orchard St., Brooklyn, N. Y., has filed notice of increase in capital from \$25,000 to \$100,000.

THE AMERICAN MALLEABLES CO., Lancaster, N. Y., has increased its capital from \$1,000,000 to \$2,000,000.

Coming Meetings and Events

AMERICAN CHEMICAL SOCIETY will hold a meeting at Rumford Hall, Chemists' Club, New York City, on June 10.

AMERICAN CHEMICAL SOCIETY, THE SOCIETY OF CHEMICAL INDUSTRY and the American Section of the latter society will hold a joint meeting in New York, Sept. 6 to 10.

AMERICAN ELECTROCHEMICAL SOCIETY will hold its fall meeting in Lake Placid, N. Y., Sept. 29 and 30, and Oct. 1.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS will hold its spring meeting June 20 to 24 at Detroit. Industrial excursions will be made to Ann Arbor, Saginaw, Midland and Bay City.

AMERICAN LEATHER CHEMISTS ASSOCIATION will hold its eighteenth annual meeting at the Hotel Ambassador, Atlantic City, June 9, 10 and 11.

AMERICAN MINING CONGRESS AND NATIONAL EXPOSITION OF MINES AND MINING EQUIPMENT will hold its twenty-fourth annual convention in the Coliseum, Chicago, Oct. 17 to 22.

AMERICAN SOCIETY FOR STEEL TREATING will hold its third annual convention and exhibition Sept. 19 to 24 at Indianapolis.

AMERICAN SOCIETY FOR TESTING MATERIALS will hold its 1921 annual meeting in the New Monterey Hotel, Asbury Park, N. J., during the week of June 20. Technical sessions are scheduled as follows: Tuesday, on Preservative Coatings and Textiles; Wednesday, on Cement, Concrete and Road Materials; Thursday, on Ceramics, Lime and Gypsum, on Petroleum Products and on Testing Methods; Friday, on Metals.

THE NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (SEVENTH) will be held during the week of Sept. 12 in the Eighth Coast Artillery Armory, New York City.

NATIONAL FERTILIZER ASSOCIATION will hold its twenty-eighth annual convention at the Greenbrier Hotel, White Sulphur Springs, W. Va., the week beginning June 20.

NATIONAL LIME ASSOCIATION will hold its annual convention in New York City June 15 to 17.

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stettens Restaurant, 842 Broad St., Newark, N. J., the second Monday of every month.

SOCIETY OF CHEMICAL INDUSTRY (BRITISH) at the invitation of the Montreal section will hold its annual meeting in Montreal and other Canadian cities during the week of Aug. 29, 1921. Details will be printed in this magazine from time to time.

A New Explanation Of Hardening

IN VIEW of the importance of Messrs. JEFFRIES and ARCHER's contribution to the theory of hardening metals, it is not necessary to explain why so large a portion of this issue is devoted to it. Metallurgists interested in ferrous or in non-ferrous metals will find it explains a great many apparently unrelated facts concerning hardness; colloid chemists will be interested in the application of their science to metallurgy; and physicists will be pleased to know that some of the first results of X-ray analysis have been put to good use in this inquiry into the nature of hardening.

A generalized conception of hardness is presented, and it is then shown how various substances and practices increase this hardness in a number of different alloys by merely interfering with a perfectly normal property of ductile crystals; the ability to deform by development of transgranular slips.

Little of the material used by JEFFRIES and ARCHER is new—that is, presented for the first time. Nearly all the facts are old and undisputed; many of the explanations have been advanced before, but failed of acceptance because of a lack of supporting evidence. For instance, ten years ago, GRENET presented a paper before the British Iron and Steel Institute, in which he said that the hardness of chilled irons, steels, brasses and bronzes was due not so much to the prevention of the transformation from the "hot stable" to the "cold stable" state, which would occur on slow cooling, as to its partial completion. Consequently hardening by quenching is due "solely to the fineness of the structure." These ideas were given little more than a respectful hearing, but many of GRENET's critics have since come into camp with ROSENHAIN, who has exploited the properties of amorphous iron to account for the hardness of martensite. GRENET was on the right track, but he attempted no adequate explanation of why extremely fine grain causes hard metal.

BEILBY's amorphous theory has since then become generally accepted, so that few now dispute the fact that the aggregate of minute crystals just born from austenite would possess a relatively great amount of hard amorphous metal. By X-ray analysis JEFFRIES and BAIN in America, and WESTGREN in Sweden, have but recently and definitely proved the supposition that iron in martensite is in the alpha modification and the former agrees with MCCANCE that it contains (at least in its early history) carbon in solid solution—that is, in atomic dispersion. And now JEFFRIES and ARCHER call attention to the fact that fine grain is hard because the amorphous material and random orientation of grains interfere with slip. In this way they not only establish the nature of martensite but in addition they give a rational reason for its hardness. Almost since

the beginning of metallography, hardness of steels had been associated with martensite, and every effort has since been made to establish its nature, a step which SAUVEUR, twenty-five years ago, said was necessary before the riddle of quenching could be solved. If it were known just what martensite is, then one could proceed to explain why it should be hard.

But amorphous material does not grow in duralumin, for instance, on gentle annealing. Quite the opposite. Yet the hardness of the alloy is increased rather than decreased. No matter how adequately duralumin's quenched condition could be explained by amorphous boundaries surrounding fine grains, its hardening on aging must be due to another factor. MERICA and JEFFRIES were both working on this problem, but independently, and the two of them hit upon the germ of the general critical dispersion theory—that hardness is due to the dispersion of hard particles in the alloy, hard particles of sub-microscopic but correct size, neither too large nor too small. MERICA also pointed out that hardness in quenched and tempered steel could be ascribed to critically dispersed cementite.

Approaching the general theory of hardening by the "non-ferrous route" rather than from a consideration of the former theories of hardening steel, JEFFRIES and ARCHER now brilliantly show that a critical dispersion of hard particles causes maximum hardness, since it offers maximum interference to crystalline slip. And can we not agree with MERICA that such a dispersion offers as adequate a supplement to the effect of amorphous metal in hardened and tempered steel as it does in hardened and aged duralumin?

Disregarding the elegant way in which the theory covers numerous alloys by a simple conception, when applied to steel it has the virtue of ascribing hardness to the undoubted hardness of amorphous iron and cementite, rather than to the hypothetical hardness of beta iron. This undoubtedly makes for simplicity. It is to be expected that the many able men who support the claims of beta iron will not be converted overnight, and their criticisms will doubtless be forthcoming and properly welcomed. Yet no one would accuse the beta iron theory, in the full flush of HOWE's advocacy, of simplicity. Since the principal evidence that beta iron has existence is magnetic in nature, the beta iron theory must perforce explain hardness and magnetism at the same time. But when a steel is found in which the two do not vary in a proportional way, or another steel which has two or three magnetic susceptibilities for the same hardness, the beta theorists are in deep trouble. Their opponents are inclined to believe that such anomalies are best explained by the supposition that magnetism and hardness have no close relationship—in fact, are altogether different kinds of phenomena. Yet if they are discon-

nected phenomena, the beta iron theory loses its chief prop.

Perhaps, without knowing that hardness in steel could not be explained without simultaneously explaining the magnetic and electric properties, JEFFRIES and ARCHER have "gone ahead and done it"! If for nothing else, they have our congratulations for the magnetic-hardness divorce.

Tinkering With The Patent System

WHETHER said "Eternal vigilance is the price of liberty" probably had in mind the watchfulness necessary to guard what is essentially best in any of our human institutions. Certainly it applies to the patent system of the United States which our Congressmen and Senators are wont to improve from time to time by introducing so-called reforms. In 1912 it was the Oldfield bill; in 1915 the Paige bill, and in 1921 comes Senator STANLEY with a bill to amend the Revised Statutes relating to patents. The burden of reform which all of these volunteers would load upon our patent system is some variation of a scheme to compel patentees to work their patents. The Oldfield bill proposed compulsory licensing in case an inventor was unduly slow about putting his process into effect. The Paige bill was designed to force European dye-makers to operate in the United States by causing unworked patents to lapse within two years after they were issued. Senator STANLEY'S bill would amend the Revised Statutes relating to patents with a proviso to the effect that if a patent granted to a foreigner is "not worked or put in operation so as to result in actual production . . . in the continental limits of the United States within the period of two years from the date of its issue, the United States reserves the right to license any person or persons for purposes of manufacture in the United States." Prior to these three efforts toward compulsory working, two of which were unsuccessful and the third pending, the Congress did enact a compulsory working clause in 1832, but repealed it in 1836.

Compulsory working of patents, whether on pain of having the patent canceled or being compelled to grant a license to someone else, is a device that has always appealed to lay minds. It has never been approved by the best patent counsel, nor has it been acceptable to inventors at large. Legal opinion may be summed up in the remarks of Lord MOULTON, who, in discussing the British compulsory working act of 1907, said: "I think it is not only mischievous, it is also idiotic. It is one of those cases which are growing to be common, where the layman rushes into legislation with little or no acquaintance with the subject on which he is legislating. Knowledge has gone so far that the layman cannot keep up with the technical knowledge of a subject, even in politics. In my opinion, it would have been impossible for any man who understood this matter to devise the present legislation."

We respectfully commend Lord MOULTON'S opinion to Senator STANLEY and his colleagues and offer in addition a few arguments for defeat of the proposed legislation.

It is reported that Senator STANLEY'S avowed purpose in advocating this measure is to prevent a situation such as arose at the outbreak of the war when the

United States was cut off from supplies of German dyes. Presumably he believes that a compulsory licensing clause, which is in effect a compulsory working clause, would result in German manufacture in this country under German-owned United States patents. As Dr. B. C. HESSE pointed out in great detail in an address before the Rochester Section of the American Chemical Society in October, 1915, compulsory working would not create a dye industry. He showed also that compulsory working has been ineffective in the principal foreign countries and that some of those countries have entered into a mutual understanding whereby the clause is not enforced against their respective citizens. Further, Senator STANLEY'S plan would force German capital to manufacture in this country, thus promoting that "peaceful penetration" of industry which we found so objectionable when we went to war. It is true that the Stanley compulsory licensing clause applies only to foreign owners of United States patents; but to enforce it against them would encourage advocates of the idea to make it applicable to all United States patents, even though owned by American citizens. It requires no stretch of the imagination to see how surely such a measure would cause uncertainty on the protection afforded by a patent, and so weaken that protection that patents would have diminishing attraction for capital. The market for inventions would be decreased and the incentive of inventors proportionately reduced. And since the prime object of our patent system is to induce men to produce inventions, we should be exceedingly careful how we hedge them about with discouraging restrictions.

Those who have had experience with the development of patents will realize that two years is a comparatively short time in which to bring many processes and products to the stage of production contemplated in Senator STANLEY'S bill. This would deter inventors from perfecting their processes; and for the same reason it would probably deter licensees, because the first licensee would have to undergo the expense of development while others might come in and take licenses and manufacture without the handicap of initial development and expense. And as for the poor inventor who is now supposed to find it difficult to bring his patent to the production stage, would he not be worse off under a scheme of compulsory licensing? If manufacturers can now buy and suppress patents, as they are popularly supposed to do, how equally simple would it be for them to delay negotiations with an inventor for two years and then demand a license. We may also raise the question as to whether the license is to be exclusive or not. Presumably not, because "the United States reserves the right to license any person or persons" for the purpose of manufacture. And if licenses are not exclusive, how generally will they be taken, seeing the difficulties that will beset the licensee who takes upon himself the burden of initial development?

We have been able merely to touch upon the obvious features of the situation that would be created under Senator STANLEY'S bill and its logical development. The situation is fraught with danger to the patent system and to the inventive propensity of the American people. We understand that the bill has been reported favorably to the Senate by the Committee on Patents. Accordingly it will be necessary to take early action if the measure is to be defeated. We shall be glad to publish further discussion of the subject.

Labor Unions And Inefficiency

WHEN one discusses the single tax he discusses it on the basis of theory, since it is not operative. When one discusses the income tax he discusses it on the basis of practicality, because we have had it for several years and can observe its operation.

When we discuss labor unions and labor unionism we naturally discuss them on the basis of what we see. There is no occasion to consider theories or ideals regarding labor unionism because any theories entitled to consideration have had an opportunity to work out in practice. The labor union movement is not new. It is not because there has been insufficient time that only between 10 and 15 per cent of the workers are organized and between 85 and 90 per cent are left unorganized. If labor unionism as we see it involves inefficiency and injustice, it must bear the blame.

If we are investigating a species of plant, we observe where it grows, study its habitat and eventually determine the surroundings under which it will or will not grow. We can study mental inclinations in the same manner. In certain circumstances men tend to grow avaricious. In certain surroundings religious aspirations are aroused. Associated with certain persons one becomes ambitious to wear the most tasty neckties, while in association with a certain other kind of men thoughts about neckties do not thrive and the desire to be able to stick on a bronco's back has a vigorous growth.

The method is strictly applicable to a study of labor unionism. What is the favorite habitat of labor unions? Where do they thrive? Of the total enrollment in labor unions in the United States one finds that a very high percentage of the membership is included in three categories: (1) The United Mine Workers, whose members mine bituminous coal and anthracite; (2) the building trades; (3) the steam railroads and trolley lines. Outside of these three categories unionism is practically insignificant. The percentage of all unionism that is comprised in these three categories is very high, and the percentage of disturbance to the general industrial and economic situation caused by the unions in these particular lines is higher still.

Here, then, we have the favorite habitats discovered beyond peradventure of doubt. Whether studying a variety of plant or studying labor unionism, the investigator next proceeds to inquire whether there is anything peculiar about the discovered habitats that differentiate them from other places. No difficulty whatever is encountered in differentiating. Strikes in these lines of activity are in essence directed against the general public rather than against the proximate employer. In a trolley strike in a large town, which has the more patience, the public service corporation or the public that must foot it? In a six-day strike, who would suffer the more, the shareholders of the Pennsylvania Railroad Company or the patrons of the railroad? Or in an office building, the contractor whose margin is in a measure a percentage of the wages paid or the owner who has money tied up and wants to be ready for the office-leasing season? That is one kind of habitat where unionism thrives. The other is where a strike or wage disagreement is not disadvantageous to the employer. Time after time in the coal industry it has been found that consumers were stocked with coal in anticipation of a suspension of mining on the

biennial April 1 and the operators needed a suspension to permit the consumption of stocks so that damaging competition would be averted.

In all these cases we find inefficiency, the workman not doing the full amount of work he should do in a day, to do his share toward bearing the total burden of the work of society.

Promotion in Technical Positions

THE chemical profession generally will congratulate Dr. A. C. FIELDNER on his well-deserved appointment as director of the Pittsburgh Station of the Bureau of Mines. This is a recognition of Dr. FIELDNER's ability as an investigator and as a director of investigations. It is to be hoped that Dr. FIELDNER's new responsibilities will not weigh so heavily upon his hands as to prevent continuance of his work in the field of fuel investigations. The contributions which have come from his organization have been notable, and it would be a great loss if purely administrative and executive duties were permitted to interfere with his further active participation in this invaluable scientific work. Both in the Government and elsewhere there is too much of a tendency to place upon such men the burden of administrative responsibility which interferes with the work they are so well fitted by training and experience to carry through. It is often quite simple to secure for this administrative work much less experienced and less valuable men who, though capable in this particular, are not themselves investigators, either by temperament or training. It is very fortunate that the bureau recognizes this fact and plans to give Dr. FIELDNER such assistance as we hope will prevent unduly burdening him with correspondence and other details that always beset the chief of a large organization.

Our industrial organizations of technical sort, though striving for commercial efficiency, sometimes have not been as willing as they should to be efficient in such matters as this. If the only way in which the chief chemist, the chief metallurgist or other director of investigations can advance himself within a company is by assuming executive responsibilities, it is not strange that he seeks such position. Especially if the difference in salary between the purely executive position and the position in charge of research is large do we find this tendency to change from science into the commercial branches of the organization. It is certainly false economy to permit a man who has demonstrated his ability in research and development work to become a slave to routine. He may succeed at it, though this is by no means sure, but in any event the company will lose if such change is made. Even at the risk of paying the so-called subordinate men more than the executive head it may be worth while to keep successful research men in the field of their specialties. New developments which they produce may not save as much in a single year as would a valuable administrative decision or change in operating plan, but the improvements thus achieved are capitalized for all future time. In fact, without them the corporation may fall in the race for commercial supremacy distinctly behind its competitors in technical method or value of product. It is best by all means to keep each scientific man in the job for which his training and experience best fits him, even though the salary roll may look a bit unbalanced.

Readers' Views and Comments

Production of Pure Platinum

To the Editor of Chemical & Metallurgical Engineering

SIR:—I notice in the edition of your magazine dated April 20, 1921, on page 696, you mention that the Bureau of Standards has recently succeeded in producing platinum of higher purity than any obtainable from other platinum dealers, and also that Heræus' platinum has long been accepted as standard. It is also stated that this pure platinum has been melted in lime.

I would mention that the firm of Johnson, Matthey & Co., Ltd., of London, has for many years produced pure platinum, as I can attest from forty-seven years' experience with the firm. The platinum produced by it has passed all tests and is pure, but to produce it pure it is not necessary to melt it as you state, and the slightest trace of lime, if found, is not caused by melting in lime.

For your general information, I would say that G. Matthey, F.R.S., produced pure platinum by carefully refining metal, precipitating, washing in pure water free from Ca, pressing the powder into a solid ingot by hydraulic pressure, after which it was heated in a closed muffle, placed under a powerful drop hammer, and welded together. As is generally known, platinum is one of the easiest metals to weld. My experience is that if you want pure platinum do not melt it unless you are looking for trouble. Obviously if alloys of platinum are wanted, they must be melted, but the high temperature required causes (slight) contamination with the refractories used.

I may say that I am not depreciating the work of W. C. Heræus in the production of pure platinum.

Maidstone Road, Bound's Green,
London, N. 11.

H. A. KENT.

To the Editor of Chemical & Metallurgical Engineering

SIR:—I have read with interest the comments of H. A. Kent, of London, with reference to the brief press notice that appeared in your journal on the production of very pure platinum.

Mr. Wichers' paper is now in press and will appear shortly in the *Journal of the American Chemical Society*. In this paper there is given the experimental evidence in support of the statement that the platinum produced by the methods there described is of higher purity than any samples of Heræus platinum that we have been able to obtain or about which we have been able to find any published data. The platinum wire produced by Mr. Wichers was compared with a number of samples of Heræus platinum wire, selected from among the purest samples that we have been able to obtain from that maker during the past fifteen years.

I may add that Mr. Wichers did not compare the wire produced by his method of purification directly with a sample of Johnson, Matthey & Co. platinum wire, but no samples of wire that have thus far come into our possession from the latter source have quite equalled in purity the purest Heræus platinum wire. It has been found that the purer the platinum the higher its temperature coefficient of electrical resistance. For the purest Heræus platinum, the ratio of electrical resistance at 100 deg. to electrical resistance at 0 deg.—

i.e., $R_{100} \div R_0$ —is somewhat above 1.391. The samples of Johnson, Matthey & Co. platinum wire tested in the laboratories of the Bureau of Standards during the past fifteen years were found to give values of this ratio of about 1.386. Some specially pure samples of platinum wire furnished by Johnson, Matthey & Co. to a committee of the British Association were reported (B. A. Report 1901) to have a value equal to 1.3892. Dr. J. A. Harker in a report of the same committee (B. A. Report 1903) gives for the values of this ratio figures ranging from 1.387 to nearly 1.389. It seems very probable, therefore, that the Johnson, Matthey & Co. platinum is not quite so pure as is the Heræus platinum.

In another paper, now in preparation, it will be shown that Johnson, Matthey & Co. platinum, as furnished for high temperature thermocouples, contains *relatively* large amounts of calcium as compared with Heræus platinum and very much larger amounts than the platinum refined in the laboratory of the Bureau of Standards. The amount of calcium can be very greatly reduced by merely melting on lime under proper conditions.

I may add, in conclusion, that Mr. Wichers and his associates, C. O. Fairchild and W. F. Meggers, have also obtained thermoelectric and spectroscopic evidence that the wire which he has produced is purer than any of the samples with which it has been compared.

W. F. HILLEBRAND,

Chief Chemist, Bureau of Standards.

The Vapor Compression System of Evaporation

To the Editor of Chemical & Metallurgical Engineering

SIR:—May I offer the following information relative to Mr. Carlsson's article on "The Vapor Compression System of Evaporation" on pages 645-647 of your issue of April 13?

In introducing his subject, he suggests that multiple-effect evaporators have decided weak points both from an economical as well as a technical standpoint and throughout his article gives the impression that fuel must be primarily consumed to operate such equipment. As a chemical engineer, having had over ten years' experience in the design and operation of evaporators from the coil type to the film type, may I state that over 95 per cent of the multiple-effect evaporators operating today are using exhaust steam in whole or in part? It is first used in prime movers and fed to the vacuum plants at pressures up to 5 lb. per sq.in.

In actual practice with a film type of evaporator my own records over a long period show 2.8 lb. of water evaporated per lb. of exhaust steam used in a triple-effect machine having a capacity of 10,000 lb. per hour. This evaporation was obtained without the use of a preheater or utilizing hot outgoing condensate or vapors; with such arrangements the heat efficiency would have been increased.

Is it not rather a sweeping statement to say that "many suggestions of new evaporation methods made in recent years have failed until quite recently"? I can specifically state a number of cases where evaporation improvements have been carried out within the past ten years. For instance, the advent of the film evaporator resulted in such a compact design that it

was possible to superimpose three effects, thus making a self-contained triple-effect evaporator.

Mention that the Swiss firm began marketing the "Autovapor" evaporator only in 1918 places that firm far behind the pioneers in this system of evaporation utilizing vapor compression principles. As far back as 1906 experiments were made with a Simplex film evaporator in which live steam injector was embodied, which sucked back and compressed the vapor coming from the liquor. This compressed vapor and ingoing steam was then passed back to the calandria to perform further work. This in itself utilized the principle of vapor compression, although it was not carried to any elaborate conclusion. Prior to 1914 a technochemical concern built a vapor compression evaporator plant in London. This was known as the Söderlund-Boberg evaporator and has priority in development work over the "Autovapor," if it is not the same equipment.

I consider that the "Autovapor" efficiency figures quoted are on the high side, particularly if they were obtained with the design of equipment shown. It is well known in evaporator work that, consistent with the class of liquid being handled, the higher the temperature difference between the heating medium and liquid being heated the higher the transmission factor per square foot effective heating surface. For standard vacuum evaporator work, using exhaust steam, this temperature difference varies from 30 to 100 deg. F. Such a difference as 30 deg. F. would not be economically permissible with a vapor compression system, as the power and capital expended to produce this difference would overbalance any conservation of heat thereby gained. To make any vapor pressure system economically effective it is necessary to operate with low temperature differences, and this means increased heating surface. Using a coil type of pan, the heating surface would be so large for a normal commercial unit that the initial cost would be prohibitive.

Why distilled water (or condensed vapor) from the "Autovapor" is purer than that obtained from vacuum evaporators is not explained and is not perfectly clear.

I take exception to the balance sheets submitted, in that it is assumed the steam used is primarily produced for this purpose, where, as before mentioned, the majority of plants use exhaust steam. Again, the figure of 2 lb. of water evaporated per pound of steam for a triple effect is too low, and should be 2.8 for a film type of plant, which is the most modern type of vacuum evaporator. The figure of 8 hp. for a condensate pump designed for a triple-effect evaporator of 2,200 lb. capacity has evidently been taken from a textbook. The actual practice figure is nearer 2 hp.

I am glad the writer indicates the shortcomings of this system, in that "when dealing with concentrated solutions, the conditions are not so favorable, because the boiling points of the solutions are higher than those of solvents." This means that it is too costly to compress the vapor to a point where the temperature difference would produce a concentrated solution.

A triple-effect film evaporator will treat any and all solutions, concentrating up to 30 deg. Bé. continuously, evaporating 2.8 lb. of water for 1 lb. of exhaust steam and with a mechanical expenditure of 1.7 hp. per 2,000 lb. evaporated, with no high-speed or complicated mechanism requiring skilled supervision.

It will be many years before a compression system of evaporation will be able to compete with the film

evaporator in the average industry, and electrical or water power will have to be at low cost, with a perfected fool-proof compressor, made sufficiently rugged to warrant unskilled attention. The capital cost and overhead, involving skilled attention for compressor and evaporator, is not included in Mr. Carlsson's balance sheet.

BURTON DUNGLINSON.

Chicago, Ill.

To the Editor of Chemical & Metallurgical Engineering

SIR:—My statement, in my article on "The Vapor Compression System of Evaporation" in your issue of April 13, that the multiple-effect system has weak points from economical and technical points of view, refers to the fact that condensers in general have to be installed with the result that a certain amount of latent heat is wasted. Furthermore, having rather small quantities of water to evaporate, it is very expensive to install such a huge aggregate to get the desired efficiency, the Autovapor having only one container with its compressor and motor with which a good efficiency is obtained. The latter installation does not require more labor than the multiple-effect system. With larger apparatus using exhaust steam in evaporation, the calculation on page 647, second column, shows that the compression system is able to compete favorably with a multiple-effect system. Throughout the article the calculations are based upon installations having a capacity of 2,200 lb. A triple effect under those conditions does not have greater efficiency. For larger capacities both of the methods have greater efficiency factors and results of a comparison will still hold.

In regard to my "sweeping statement" I might say that it referred to different compression methods tried in the past and Mr. Dunglinson has mentioned two which he knows have been a failure or at least had but a very limited application. As far as my experience goes, this is true. This pioneer work, however, I am certain the manufacturers of the Autovapor appreciate and I don't think they claim to be the first ones.

As a matter of fact the Söderlund-Boberg people confine in their English patent the use of the machines to solutions similar to sulphite cellulose waste liquor.

The Autovapor in its perfection now accomplished is running with quite different heat head than the Söderlund-Boberg, in fact it is similar to that of multiple-effect evaporators due to the development of the high-speed turbine compressor. This machine is able to handle the vapor in a very satisfactory manner. As a matter of fact, the point in this system is the compressor and its accomplishment has been such that the vapor compression system is economically effective without operating with low temperature difference and too much increased heat surfaces.

The efficiency figures are not on the high side. They are obtained in real practice and with a small installation. In this connection I would like to correct the figure 19.3 on page 647, line 48, which ought to be 42.7. With greater units higher results are obtained.

I have a list of twenty-five installations of this apparatus in Europe showing that the Autovapor has passed its "childhood." I think this fact is the best answer to Mr. Dunglinson's statement of the probable shortcoming on the part of the Autovapor system.

That the compressor really is fool-proof and that the expenses for capital cost and overhead are not prohibitive do not require discussion. GUSTAV CARLSSON.

Niagara Falls, N. Y.

Italian Chemical Industries

FROM OUR SPECIAL CORRESPONDENT

GENOA, Italy, May 20, 1921.

DURING the last few weeks the crisis in the Italian chemical industries has been aggravated by the elections just finished, by the shortage of American and English coal, and by the upset conditions of labor. Only a few works, especially those producing the common acids, alkalis and fertilizers, can continue their work as usual, whereas all those producing the finer chemicals have either closed or continue under great difficulty, working only for four days a week with reduced hours. In the metallurgical and engineering industries only those concerns which have to supply materials to the Italian state railways, to the shipyards and to the hydro-electric plants can be kept in running condition.

FOREIGN EXCHANGE SINKS FURTHER

The foreign exchange, especially in the cases of the United States dollar, of the English pound and of the Swiss and French franc, has sunk considerably during the past month, while no change followed through a renewed business intensity with German-speaking countries and some of the new Balkan states. These conditions and the absence of demand brought a further reduction in prices for most chemicals, metals, drugs, essences and other products, causing great losses to the producers and merchants. The exportation of Sicilian products has come to a sudden standstill owing to the rise in price when sold for foreign currencies. A new law authorizing the exportation against payments in Italian lire was issued, and this, it is expected, will facilitate a resumption of foreign traffic.

ITALIAN INDUSTRIALS MEET

With the view of helping the future of the chemical industries and other Italian industries the principal Italian industrials met at Rome under the auspices of the Minister of Finances to discuss the difficulties through which the said industries are passing, and demonstrate the utter impossibility of continuing with the present fiscal taxes, which are gradually ruining all industrial enterprise.

WAGE IMPROVEMENT IN THE CHEMICAL INDUSTRY

After several sittings and discussions, the troubles between the Italian chemical workmen and their employers were finally settled. Through the accord reached the wages will be increased 0.50 lire for the men, and 0.40 lire for the women, boys and girls, dating back to Feb. 1, 1921. From this arrangement are excluded the dye works of Cengio, Rho, Cesano Maderno and Turro, and companies that have national agreements.

ITALIAN FERTILIZERS

The demand for immediate delivery of fertilizers is nearly stopped, owing to the advanced season. Contracts for July, August and September delivery of important amounts of superphosphate were concluded recently, but the prices made in this instance are much below those of the market quotations.

A NEW INDUSTRIAL FAIR

A new industrial fair, occupying an area of 25,000 sq.m. and arranged for accommodating over three thousand exhibitors, was inaugurated in the City of Milan.

The leading concerns manufacturing drugs, essences and metallurgical products in Italy and other countries were represented. Besides the usual world-known products, new raw materials for producing refreshing drinks, pharmaceutical products and essences were noted. German-speaking countries have taken advantage of this exhibition to advertise their produce in all branches and to open new business relations not only in Italy but also elsewhere.

NEW WATER-POWER AND HYDRO-ELECTRIC DEVELOPMENTS IN ITALY

Further developments took place during the last five weeks in Italian hydro-electric plants. The erection of an important plant at Mazé has just been started. The waters of the River Dora with 60-m. head will be diverted, through special canals, to a series of turbines. The electric power is to be utilized in the neighborhood. The Italian Council of Ministers has approved special arrangements to guarantee the financing of the erection of new hydro-electric plants. A law was published constituting the Autonomous Association for the Development of Hydraulic Power and New Waterway along the River Adige to the Lake of Garda. This would prove greatly beneficial to the provinces of Verona, Mantova, Modena, Bologna and Trento. The new concern will have an unlimited capital, being financed by some of the most important banks, and will use the hydraulic power for light, for electrification of the railways and for motive power in the industries of these provinces. The construction of the second largest hydro-electric plant in the world (the Niagara Falls plant being the largest) not far from the City of Venice has already been started. Two thousand five hundred workpeople are now employed on the work of building canals by which a great portion of the waters of the River Piave will be caused to run into a huge distribution basin leading to the power plant. This work is pushed simultaneously with that of the enlargement of the port of Venice.

COAL SCARCITY IN ITALY

A great famine of American and English coal is being experienced, owing to the suspension of all deliveries from England and to the fact that few ships have reached Italy from the United States. This has brought up the prices very strongly for the rare lots of the coal still available. To help matters as much as possible the Italian state railways have further lowered the prices of the German war reparation coal which they offer for industrial purposes and for consumption in the ports. Not all the consumers of coal could take advantage of such offer owing to their plants requiring better qualities of coal, such as that which can only be obtained from the United States and from England.

ITALIAN ARTIFICIAL DYE INDUSTRY

The Italian Minister of Industry is studying the application of customs tariffs for favoring the Italian artificial dye industry. This industry, born principally during the war, has now four large works in Lombardy and Liguria, and employs thousands of workmen. The Italian customs, up to the moment of writing, did not place any importation duty on dyestuffs, nor are these considered among the products of prohibited importation. This tariff encounters resistance on the part of producers of colored fabrics and yarns, who wish to get the products they use at as low a price as possible.

Survey of Chemical Engineering Education

Summary of Questionnaire Showing Curriculum of 78 Institutions—Courses Taught Include 49 in Chemistry, 15 in Physics, 10 in Mathematics, 9 in Mechanics, 6 in Engineering Elements, 31 in Mechanical, 6 in Civil, 8 in Electrical, 6 in Mining, 14 in Sanitary, 3 in Safety, 14 in Industrial, 11 in English, 6 in Languages and 23 Miscellaneous

THE committee on chemical engineering education of the American Institute of Chemical Engineers, composed of Joseph H. James, Ralph H. McKee, Charles L. Reese, Albert W. Smith and James R. Withrow, with Arthur D. Little as chairman, has initiated a survey of chemical engineering courses in seventy-eight institutions in the United States, this being the entire number known to the committee as offering such courses. Through the co-operation of the presidents and heads of departments in these institutions it has been possible to tabulate in a comparative way the apportionment of time and credit to the several subjects included in these courses, and this tabulation is here presented, primarily as a report of progress and for the purpose of precipitating the discussion which the extraordinary variation in such weighting would seem to justify.

MULTIPLICITY OF SUBJECTS INCLUDED

The first feature of outstanding significance is, of course, the remarkable multiplicity of subjects that have come to be included in these courses. The next of important interest is perhaps the widely divergent views as to the relative values assigned to the same subjects in the different institutions. There appears also to be a tendency to multiply courses by the subdivision of fundamental subjects into minor courses that might conceivably to better advantage be tied together into a major course.

NEED OF STANDARDIZATION

All this would seem to point quite clearly to an imperative need of standardization of courses of chemical engineering as taught in our American institutions. To what extent, however, this may be desirable, how it may best be accomplished, or whether a complete recasting of courses along the lines suggested by the case system or the School of Chemical Engineering Practice of the Massachusetts Institute of Technology is the indicated remedy, the committee at this time expresses no opinion, preferring to have the benefit of the views and discussion which it is hoped the publication of this tabulation may provoke.

Any communications relative to the subject will be especially welcomed and will receive careful consideration if addressed to Dr. Arthur D. Little, chairman of the committee, at 30 Charles River Road, Cambridge 39, Mass.

The table is being published in advance of the committee report to the society at the Detroit meeting next week to enable proper study prior to discussion there. The views presented at the meeting will be published in connection with the report of the meeting or separately in a subsequent number. Those who wish to forward written communications to the meeting expressing their views should send them to Dr. John C.

Olsen, secretary, Statler Hotel, Detroit, in time for presentation on Monday.

EXPLANATION OF THE TABLES

Where the parenthetical numbers (5) and (6) are used in connection with the hours devoted to a subject, five- and six-year curriculums are indicated. The footnotes indicated by single, double, triple and quadruple crosses are to be found under Remarks, lines 222-226 in the respective columns in which they occur.

The forty-nine headings under chemistry show a tendency for a few institutions to offer a specialty such as sugar at Louisiana and paper at Maine. It is also an indication of the limit of possibilities of chemical instruction and how much must be left for the student to dig out for himself after graduation. Irish history seems to be the joker, no institutions giving credits or devoting hours to it, but the committee must have included it with full knowledge that no chemical engineer can get along in a manufacturing plant without knowing the ways of the Irish foremen.

CHEMICAL ENGINEERING LABORATORY FACILITIES MEAGER

Only twenty-seven out of the seventy-eight institutions included in the report offer any chemical engineering laboratory facilities or instruction. In any other field of engineering education this would be inconceivable. However, the types of equipment that are available for student work are so very limited in variety and size that it is an open question whether equipment operation can be studied anywhere except in a manufacturing plant. The large-scale evaporator station at the University of Michigan shows the possibilities for engineering research and design data determinations within the province of the university. Other fields of activity such as distillation, reduction and grading of solids might be similarly intensively developed on a large scale, if the commercial interests involved could be persuaded to co-operate with the institution having the best fitted staff to take up the work.

The large number of white spaces under Industrial Engineering again emphasizes the fact that the student going into a plant organization has to realize that he has just graduated into being his own teacher. He must be able to create a course for his own study on production engineering, costs, operation planning, industrial relations, commercial specifications, estimates and contracts whenever there is a demand, if he is ever to quit the drawing board and be an executive.

Undoubtedly there are errors, some even so colossal as omitting the name of some very important institution such as the University of Illinois or physical chemistry from the curriculum of Boston Tech. We shall be glad to publish all corrections received and forward them to the committee.

Specifications for the Color of Gypsum Plasters

BY WARREN E. EMLEY AND CHARLOTTE G. FAXON*

IN THE Tentative Specification for Gypsum Plasters, published by the American Society for Testing Materials, in 1920, the following paragraph occurs:

"Calcined gypsum for finishing coat may or may not contain retarder. It may be sold in two grades—viz., 'white' and 'gray.'"

Numerous cases are on record where dealers have ordered gypsum plaster of such a color that it will match a previous shipment. If the second lot is to be used to patch a wall which has been plastered with the first lot, obviously the colors must match pretty closely.

For white coat work it is customary to mix calcined gypsum with lime putty. Unless the mixing is done with unusual care, there will be spots of lime visible in the finished wall. Just how plainly visible these spots are will depend upon the relative colors of the lime and the gypsum. If they are both the same color, the spots will be invisible; if one is nearly white and the other dark, the effect may be so bad as to condemn the plaster.

INVESTIGATIONS FOR MEASURING THE COLOR OF GYPSUM PLASTERS

The above citations illustrate the need for some method of measuring the color of gypsum plasters and of specifying any color which may be desired. In order to meet this need an investigation was undertaken at the Bureau of Standards, and this paper is intended to present the results so far obtained.

Fortunately, the method had already been established, and the equipment was available. These are described in detail in Bureau of Standards Technologic Papers 92 and 167. Irwin G. Priest, chief of the color section of the bureau and senior author of both of the above papers, has co-operated with us not only by giving personal supervision to the experimental work, but also by assisting in the interpretation of the data.

A careful study of the subject can be made only by reference to the two papers cited above. For this reason, only a brief description of the method used will be given here.

A small block of the plaster to be examined was molded and allowed to become thoroughly dry and hard. It was mounted for spectrophotometric examination beside a standard block of magnesium carbonate in a box so that the sample and standard were diffusely and equally illuminated, and so placed that one half of the spectrophotometer field was illuminated by light reflected by the sample, while the other half was illuminated by light reflected by the standard. By rotating a Nicol prism, the brightness of one half the field may be made to increase, while that of the other half simultaneously decreases. When the two halves match, the position of the prism indicates the relative quantities of light reflected from the sample and the standard. By rotating a glass prism in the path of the reflected light any desired wave-length may be selected, light of every other wave-length being simultaneously cut off. It is thus possible to measure the ability of the sample to reflect light of any wave-length and to compare this ability with that of the standard

magnesium carbonate which reflects nearly 100 per cent of the light falling on it. The ratio between the intensities of the light of any given wave-length reflected by the sample and by the standard may be expressed as a percentage, and may be plotted against the wave-length. This method of expressing the results is shown in Fig. 1, which is drawn from actual data obtained by measurements of the reflecting powers of a gypsum plaster for lights of different wave-lengths.

A careful study of this curve is worth while, as it illustrates several points pertinent to the problem in hand. If the curve is a straight, horizontal line, the color which it represents will be neutral—white, gray, or black. Whether the color is white or black will be indicated by the position of the line. If the line shows 100 per cent reflection for all wave-lengths, the sample is as nearly white as the standard. A perfect black would show zero per cent reflection for all wave-lengths; intermediate positions of the line indicate varying shades of gray, but the grays are purely neutral only when the line is straight and horizontal. In the case illustrated, the line is neither straight nor horizontal. It shows that the reflecting power of the sample for blue light was deficient, which is another way of saying that the sample has a yellow or red tint, and the sample varies from neutral gray to that extent. Since the reflecting power runs from about 50 per cent of that of the standard in the blue to about 70 per cent in the red, it is evident that the neutral gray to which the color of this sample approaches is not very nearly white.

Fig. 2 shows the approximate average spectral distribution of light from the noon sun at Washington. If the ordinate of this curve corresponding to each wave-length is multiplied by the per cent reflection for that wave-length as shown in Fig. 1, the results may be plotted to give the curve in Fig. 3. This curve represents the spectral distribution of sunlight after reflection from the sample. The area under this curve is proportional to the total reflection of the sample for sunlight. This area may be expressed as a fraction of the area under the standard curve, Fig. 2. The relative brilliance of the sample is then directly proportional to the logarithm of this fraction.

Measurements were made on thirteen samples of gypsum plasters, to determine their ability to reflect lights of different wave-lengths. The results were plotted in curve form, of which Fig. 1 is typical. All of the curves were of the same general shape—that is, all of the plasters had a yellow or red tint. The curves differed in their positions, however, which shows that some of the samples approached the whiteness of the standard more closely than others did.

REQUIREMENTS FOR SPECIFYING THE COLOR OF A PLASTER

Inasmuch as the samples examined were selected as being representative of the entire field and the curves were all found to be similar in shape and without pronounced breaks, it may be assumed that gypsum plasters will not show any pronounced color unless some pigment has been intentionally added. The color of a plaster may therefore be specified by stating how much it varies from gray (that is, how red or yellow it is), and how far this gray departs from the standard white. The former requirement may be expressed numerically as the ratio of the per cent reflection of blue light (compared with the standard) to the per cent reflection of

FIG. 2 - Spectral Distribution of Average noon Sunlight at Washington D.C.

FIG. 3 - Spectral Distribution of Sunlight as Reflected from Sample No. 9. Each Ordinate is the Product of the Correspondent Ordinates of Figs 1 and 2

FIG. 4 - Comparative Colors of Samples Examined

yellow light. Blue light has a wave-length of 436 millimicrons; yellow light, 578 millimicrons. If this ratio is 1, the sample is gray; if greater than 1, it has a blue tint; if less than 1, a yellow tint. The second requirement has already been defined as being numerically expressed by the logarithm of the ratio between the area of the curve shown in Fig. 3 to the area of the sunlight curve shown in Fig. 2.

The results obtained from the thirteen samples examined are listed in the following table, and are shown in the form of a diagram in Fig. 4.

Sample No.	Description of Sample	Ratio of Reflection Blue:Yellow	Log. of Ratio Total Reflection of Sample: Total Reflection of Standard
1.	Plaster of paris F (Nova Scotia gypsum)	0.900	0.105
4.	Windsor FFF plaster (Nova Scotia gypsum)	0.870	0.134
8.	Superfine Windsor cement (Nova Scotia gypsum)	0.846	0.107
9.	Wood fibered plaster (Nova Scotia gypsum)	0.787	0.203
10.	Potters' plaster (Nova Scotia gypsum)	0.923	0.078
11.	Retarded gaging plaster, Oklahoma	0.866	0.216
12.	Unfibered cement plaster, Oklahoma	0.881	0.138
15.	Molding plaster, Oklahoma	0.898	0.184
20.	Molding plaster, Ohio	0.863	0.202
21.	Stucco, Iowa	0.907	0.165
22.	Retarded stucco, Iowa	0.925	0.144
23.	Molding plaster, New York	0.939	0.100
25.	Stucco, New York	0.957	0.106

In the last column a small number indicates a close approach to the whiteness of the standard. The smaller the number in the next to the last column the more yellow is the sample. If this figure were 1, the sample would be gray.

In Fig. 4 a horizontal line has been drawn midway between the extreme values of samples 10 and 11. It is proposed that all samples falling above this line may be called white, and all samples falling below it gray. A careful visual examination of the samples indicates that this classification is satisfactory.

The position of the vertical line has been arbitrarily fixed. Sample 9 is apparently the only one which might be condemned as being too yellow, and the line has been placed accordingly. Samples falling to the right of this line should not be designated as either white or gray; they are yellow.

The requirements suggested for a "white" plaster are therefore: (1) The logarithm of the diffused reflection for average sunlight shall be numerically less than 0.147, and (2) the ratio of the reflection of blue light (wave-length = 436 millimicrons) to the reflection for yellow light (wave-length = 578 millimicrons) shall be not less than 0.8.

For a "gray" plaster, requirement 1 as changed to read "more than" instead of "less than." Requirement 2 is the same for both white and gray plasters.

While it is believed that a "white" plaster meeting the requirements given above will be nearly enough white to be satisfactory for all commercial purposes, it must be remembered that the requirements are rather lenient. Therefore, white plasters may differ noticeably among themselves. If it is necessary that two white plasters shall match each other, much more rigid requirements must be specified.

In case a plaster of perfectly definite color is desired, an individual specification must be written, for it is obvious that there can be as many such specifications as there are colors. It is suggested that in writing such a specification a curve similar to Fig. 1 be drawn, indicating the desired color by the shape and position of the curve. A deviation from the curve of 5 per cent either way at any wave-length should be permitted.

Byproduct Coke Plants in the United States

The following list of manufacturers of byproduct coke in the United States May 1, 1921, has been compiled by the United States Geological Survey:

Operator	Address	Name or Location of Works	Number and Kind of Ovens
Alabama			
Alabama By-Products Corp.	American Trust Bldg., Birmingham.	Birmingham.	50 Koppers
Gulf States Steel Co.	Brown-Marx Bldg., Birmingham.	Alabama City.	37 Koppers

The Slip Interference Theory of the Hardening of Metals

A Mechanical Conception of Hardening of Pure Metals, Allotropic and Non-Allotropic, of Solid Solutions of Constant or Variable Solubility, and of Metallic Aggregates—In General, Hardness Is Due to Interference With Slip, a Characteristic Property of Ductile Crystals

By ZAY JEFFRIES AND R. S. ARCHER

IN GENERAL, pure metals in their normal condition are relatively soft and weak. They can be usefully hardened and strengthened by mechanical work and by alloying, and their alloys can often be further hardened by heat-treatment. The methods of hardening the different metals vary so much in detail, and the phenomena which accompany hardening are so unique, that there has arisen a variety of special theories to account for the mechanism of hardening. It is our purpose to present a more general theory applicable to all cases.

DEFINITION OF HARDNESS AND ABSOLUTE COHESION

The general terms "hardness" and "strength" connote a number of more specific physical properties. The most definite of these is the proportional limit or, what is practically the same thing, the elastic limit. The common measure of the strength of a material is its "tensile strength," or the maximum intensity of tensile stress endured before rupture, calculated on the original cross-sectional area of the test-piece. This is obviously a more complex property than the elastic limit. Hardness may mean resistance to indentation, as measured by the Brinell test; resilience, as measured by the Shore scleroscope; scratch hardness, cutting hardness, resistance to machining, or some other special kind of hardness. All of these properties may be embraced in the general definition: *Hardness is resistance to permanent deformation.*

Metals owe their hardness and strength to the attractive forces between their atoms. Any permanent deformation of a metal involves changes in the relative positions of some of the atoms, and therefore the breaking, temporarily at least, of some interatomic "bonds." The rupture of any material, whether with or without permanent deformation, also involves the breaking of interatomic bonds. The greatest possible resistance that a material can offer to deformation or rupture is the summation of all the interatomic bonds on a plane through the specimen normal to the stress, a summation which may for convenience be termed the "absolute cohesion" of the material. Actually such a summation of forces never is realized, and its total is more than sufficient to account for the strength of the strongest alloys. Rupture always takes place by degrees, and the breaking of atomic bonds is not simultaneous. The tensile strength of a material therefore represents the maximum number of atomic bonds that come into play simultaneously during the test, and since the elastic limit usually comes at a lower stress, it represents a still smaller percentage of the absolute cohesion.

Absolute cohesions of metals are far in excess of the values obtained for tensile strength. A qualitative illustration of this fact may be found in a consideration of some properties of pure iron. The tensile strength, in the hot-rolled condition, is about 40,000 lb. per sq.in., a value representing as usual the maximum load divided by original cross-section. If the actual reduced area of the test-piece

is measured throughout the progress of the test and the stress computed on this basis, a value will be found for the maximum stress which is much higher than the tensile strength. The maximum stress will then be about 80,000 lb. per sq.in. Severely cold-worked iron may show a tensile strength of 150,000 lb. per sq.in. The maximum actual stress is again somewhat higher (165,000), but not in so large a ratio as in the case of the hot-rolled iron.

Even in the cold-worked iron, rupture still takes place by degrees—that is, by a kind of tearing action—so that the highest of these figures still does not represent the inherent absolute cohesion. The significant thing is that the inherent cohesion of the pure metals is more than sufficient to account for the strength of their strongest alloys. The strengthening of a metal by cold-work can only be due to some mechanism by which the interatomic bonds are brought more effectively into play, so that more of them have to be broken simultaneously. When a metal is strengthened by alloying, the interatomic forces due to the presence of unlike atoms may enter as an additional factor, but the main factor in the hardening and strengthening consists in taking better advantage of the great inherent cohesion of the principal metal.

Metals are crystalline and are built up of atoms arranged in definite and repeating patterns. The regularity of atomic arrangement gives rise to certain planes of weakness, or low resistance to shearing stress. When an external load produces a shearing stress on such a plane which exceeds the resistance of the crystal to shear on that particular plane, fracture of the crystal takes place. The fragments formed may or may not adhere to each other. If they do not, the failure of the crystal is complete, and it is said to be brittle. The plane of weakness is then known as a cleavage plane. More generally, in the useful metals, the crystal fragments adhere and merely glide or "slip" over each other. The result of such slip, repeated on many planes, is a measurable permanent deformation; the crystal is ductile, and the planes of weakness are called "slip planes."

The first appreciable formation of slip planes marks the beginning of plastic deformation and therefore the passing of the elastic limit. The resistance to permanent deformation, which is a general measure of hardness and strength, represents resistance to the beginning and propagation of slip. Anything that serves to hinder slip is a source of strength and hardness. *The hardening and strengthening of metals by any of the known methods may be considered as due principally to interference with slip.*

FRACTURE IN A SINGLE DUCTILE CRYSTAL

Fig. 1-A represents a test-bar of square cross-section, which is supposed to consist entirely of a single grain of a ductile metal. It is further supposed that this grain has such an orientation that planes of easy slip are perpendicular to the plane of the paper and make angles of about 45 deg. with the axis of the test-piece. Now if the piece is subjected to tension, shearing stresses are developed which reach a maximum value at 45 deg. to the tensile load and hence parallel to the planes of easy slip. As these stresses increase, failure of the crystal will take place in the form of slip, or block movement, along one of these

planes, *ab*, the location of which will generally be determined by some local weakness. (Fig. 1-B.)

Ductile metals possess the property of automatically limiting the extent of the movement on any particular slip plane. Instead of slip continuing on the first plane until complete rupture of the piece occurs, the movement comes to a stop after a displacement which is very small as compared with the dimensions of the test-piece. The actual displacement may be something on the order of one twenty-thousandth of an inch, or about 5,000 atom diameters. The resistance to movement along the first slip plane increases so that slip is forced to take place on new planes.

The amorphous metal theory of Beilby offers what appears to the present authors to be the only completely satisfactory explanation of this phenomenon. The rubbing together of the crystal fragments on the plane of slip is supposed to tear some of the surface atoms loose from their regular crystalline arrangement, thus forming a layer of amorphous metal. The friction generates heat rapidly so that a high

FIG. 1. A TO D. PLASTIC DEFORMATION OF TEST-BAR COMPOSED OF A SINGLE DUCTILE CRYSTAL

temperature is reached locally. This high local temperature softens the amorphous metal, which is essentially merely an undercooled liquid. With the softening of the amorphous metal layer the resistance to slip diminishes and there is less frictional heat developed. The high local temperature is then quickly dissipated by conduction to the surrounding metal, whereupon the amorphous metal hardens and offers a resistance to further slip which is greater than that on planes on which slip has not yet occurred.

To return to our single crystal test-bar, let us suppose that the second slip is on a conjugate plane *cd*, making an angle of about 90 deg. with the planes of the first set. (Fig. 1-C.) It is readily seen how repeated slips of this character result in a general increase in the length of the test-bar, and a decrease in its diameter.

Fig. 1-D represents the test-bar after rupture. The view on the left shows the same surface of the bar as in the three views above, and illustrates the multiplication of intersecting slip planes, especially near the fracture. The view on the right shows a face of the test-bar at 90 deg. to that on the left. It will be noted that there has been no reduction in diameter on this face at the fracture. The test-piece has drawn out into the shape of a wedge. This result has actually been obtained by Sykes¹ on single-crystal wires of molybdenum, and similar results have been obtained by the authors with aluminum.

RELATION BETWEEN GRAIN SIZE AND STRENGTH

In the single-crystal test-piece with its planes of easy slip parallel to the maximum shearing stress we have the worst possible condition for resisting an applied load. The resistance to the beginning of slip is limited to the shearing strength of the crystal, since the exterior surfaces of the crystal are free and are not supported in any way. After slip has occurred on a number of planes additional resistance to slip is created, as will be explained later, and the maximum load sustained

may be well above the load required to produce the first slip.

Ordinary pieces of metal are aggregates of many crystalline grains of different orientations. Between the grains there must exist metal of disordered atomic arrangement. Whether or not this boundary metal possesses the perfectly random arrangement of atoms demanded for the "vitreous amorphous" cement of Beilby, it appears to possess the fluid characteristics of amorphous substances. At low temperatures it furthermore possesses great hardness and strength, doubtless because of the absence of potential slip planes.

In an aggregate of many grains of different orientation, there cannot be any continuous plane of weakness. The application of a load cannot produce any slip planes extending entirely across the section, as in the case of the single grain just considered. When slip takes place in any one grain it cannot continue without change of direction into adjacent grains because, except in very rare instances, the potential slip planes of adjacent grains do not register. The permanent deformation of the metal is thus resisted at the grain boundaries by the disregistry of the planes of low cohesion, and especially in fine-grained metals, by the specific hardness of the amorphous cement, which itself is due to the absence of planes of weakness. The result is an increase in elastic limit, hardness, and strength.

Sykes' tests on molybdenum wire are of particular interest in this connection, since we have single-grain wire as a starting point. The following figures are a striking illustration of the strengthening effect of grain refinement:

Grain Size	Tensile Strength Lb. per Sq.In.
Single grain ²	32,000
Average grain diameter of 0.0011 in.....	51,000
Average grain diameter of 0.0002 in.....	96,000

All these wires had a diameter of 0.025 in., and were tested at 300 deg. C., far below the lowest annealing temperature of molybdenum, which is about 900 deg. C. At this temperature (300) the results are properly comparable, since all specimens possessed considerable ductility.

The effect of grain size on the hardness of alpha brass has been carefully worked out by Bassett and Davis³. Fig. 2 shows their results obtained on a 68-32 brass. The specimens having a Brinell hardness of 80 or less are stated to be completely recrystallized. A change in hardness from 42 to 80 is therefore attributable entirely to grain refinement. From these results and his own observations, Prof. C. H. Mathewson of Yale has deduced an equation connecting hardness and grain size, as follows:

$$\text{Brinell Hardness} = \frac{K}{\sqrt[4]{D}}$$

where *D* is the diameter of average grain in millimeters, and the constant *K* has a value of about 30.

It is evident that twinning planes as well as grain boundaries represent discontinuity of the planes of weakness and hence interference with slip. The change in orientation at a twinning plane, however, is much less complete than at a grain boundary, and the strengthening effect is therefore less. While it is not possible for slip to take place through twin crystals on a continuous plane, it is possible and probably usual for slip to follow a continuous surface, which has the form of a "broken plane." The intersection of such a surface with the plane of a polished specimen is a broken line. Slip bands through twins are accordingly continuous but change direction at each twinning plane. (See Figs. 9 and 10, page 1063.)

¹The molybdenum wire tested by Sykes was made up of large grains which occupied the entire cross-section of the wire, but did not extend the full length of the pieces tested. Since each test-piece contained several grains of varying orientation, failure would be most apt to occur in that grain which happened to have planes of easy slip most nearly in the direction of maximum shear stress. Furthermore, it is probable that out of the number of grains involved some one grain was oriented very nearly in this direction of greatest weakness. The results therefore represent the lowest strength of molybdenum of the size tested. If the elastic limit had been determined we would have a value very close to the resistance to shear on the planes of easiest slip.

³"A Comparison of Grain Size Measurements and Brinell Hardness of Cartridge Brass," W. H. Bassett and C. H. Davis, *Trans.*

²"Effect of Temperature, Deformation, Grain Size and Rate of Loading on the Mechanical Properties of Metals," W. P. Sykes, A.I.M.E., February, 1921, meeting. A.I.M.E., vol. 60, p. 428.

The permanent deformation of a metal by cold-work involves the breaking of the grains into fragments along intersecting systems of slip planes, and movement of these fragments with respect to each other. In the first stages of deformation the crystalline fragments within any one grain undoubtedly retain considerable uniformity of orientation. As the deformation proceeds, there must be some rotational movement of the fragments, this being especially true near the old grain boundaries. In so far as new orientations are created, the effect is equivalent to grain refinement. It is probable that even after severe cold-working there is still general uniformity of orientation in the fragments of any particular grain. The slip interference at the surfaces between such fragments of somewhat similar orientation is therefore more on the order of the interference at twinning planes than of the interference at grain boundaries. Additional interference is offered by such amorphous metal layers as may be formed at the slip planes.

The degree of hardening and strengthening by cold-work may be very great, especially when it is possible to carry the working to extremes without causing spontaneous annealing. The following values illustrate the degree of strengthening for various metals. The term "normal" refers to a structure of equiaxed grains of average size:

Metal	Tensile Strength, Lb. per Sq.in.	
	Normal	Severely Cold-Worked
Aluminum	12,000	35,000
Copper	30,000	70,000
Iron	40,000	150,000
Nickel	60,000	250,000 (2 mil. wire)
Molybdenum	85,000	385,000 (2 mil. wire)
Tungsten	Brittle	550,000 (2 mil. wire)
Tungsten	Brittle	700,000 ($\frac{1}{2}$ mil. wire)

The great increase in strength by cold-working can be due to only one cause—the more effective utilization of the inherent cohesion of the metal. This is accomplished by minimizing the effect of the planes of weakness resulting from the normal crystalline structure.

HARDNESS OF SOLID SOLUTIONS

It is a general rule that metals are hardened and strengthened by the addition of elements which dissolve in them to form solid solutions. Our knowledge of the structure of solid solutions is quite limited, but from the results so far obtained it seems that the atoms of the solute replace those of the solvent without substantial change in the space lattice of the latter, up to the limit of the first or "alpha" solution in case of limited solubility, or the first of a series of solid solutions. This conclusion is based upon studies of alloy series in which the components have similar atomic volumes, and somewhat different conditions may obtain when this criterion is violated. There is good reason to believe, however, that in all cases solid solutions are characterized by the *atomic* dispersion of their components.

When an intermetallic compound forms and dissolves in one of the component metals, it is commonly considered to go into solution "as such." For example, austenite is generally held to be a solution in gamma iron of iron carbide rather than of elementary carbon. This implies that distinct molecules of iron carbide are dispersed in the gamma iron.

From the evidence available, and particularly from a consideration of the phenomena of diffusion, the authors have reached the conclusion that this is not the case, but that the carbon in austenite is present as individual atoms of carbon. These atoms are undoubtedly held strongly to the neighboring iron atoms, but the union

is not permanent. Diffusion must consist in a migration of carbon atoms and not of groups or "molecules" containing several iron atoms. Such groups could not, on account of their size, diffuse through solid iron.

According to this view cementite has no existence except as a crystalline substance, which is not merely precipitated but *formed* on the decomposition of austenite. An entirely similar conception is held of other

FIG. 2. GRAIN SIZE VERSUS HARDNESS IN ALPHA BRASS, ACCORDING TO BASSETT AND DAVIS

cases involving the solubility of an intermetallic compound, in particular of the case of aluminum and the compound CuAl_2 , discussed later in some detail.

For the present the essential point is that the dispersion of the components in a solid solution is certainly atomic in many cases and probably atomic in all cases. The increased hardness and strength are therefore traceable directly to increased interatomic forces, the attraction between unlike atoms being in general greater than between like atoms. We may conceive an additional mechanical factor in the form of a roughening of the slip planes due to the presence of atoms of unlike size, or, as Bridgman puts it, a staggered arrangement of the atoms.

Because of the atomic dispersion of the components and the interchangeability of the atoms, it is quite natural that solid solutions should, in general, possess ductility comparable with that of pure metals. They can be deformed plastically by the process of gliding on slip planes and are thereby hardened by the breaking up of their planes of weakness. The hardening and strengthening effects of grain refinement and cold-working apply to solid solutions as well as to pure metals, and are superimposed upon the hardening effect of the solute.

The structural constituents in alloys which possess the greatest specific hardness and strength are the intermetallic compounds and non-metallic compounds such as oxides. The structure of intermetallic compounds is less known than that of solid solutions, inasmuch as the atomic arrangement has not been worked out, to the authors' knowledge, for a single compound of this type. In general, these compounds are of a low order of symmetry, which, together with the large interatomic forces involved, accounts for their great hardness. The atoms are probably arranged in such a way that those of one element are not interchangeable with those of another element. This would account for their lack of plasticity.

One of the most important considerations in the loading

of any brittle material is eccentrically distributed stress. A ductile material subjected to eccentric loading quickly adjusts itself by permanent deformation at any points where the stress exceeds the elastic limit, with comparatively little damage. This is not possible in a brittle substance, and if the stress at any point in a piece subjected to load exceeds the elastic limit, rupture results. It is obviously easier to avoid local overstressing in small pieces than in large pieces. This accounts for the fact that many materials, which are commonly thought of as very fragile, show remarkably high strength when tested in small sections. Vitreous silica, for example, is quite easily broken when in fairly large pieces, although it shows a tensile strength as high as 160,000 lb. per sq.in. in the form of fibers.

This point is important in the present discussion in connection with intermetallic compounds. These substances are as a rule hard and brittle, and are too commonly considered to be weak. Their true strength when properly protected against eccentric loading by their small size and by imbedding in a ductile matrix is undoubtedly very high. We may safely assume that cementite, for example, has a strength of several hundred thousand pounds per square inch.

It has long been recognized that the presence of a hard and strong constituent in an alloy may strengthen it by opposing the "flow," or slip, of the weaker constituent. Just as slip is opposed at the grain boundaries of a pure metal by the change in orientation, it may be opposed to a still greater extent if the material at the grain boundary possesses in addition to its different orientation a specifically greater hardness. The most familiar example of this is the reinforcing effect of the pearlite constituent in hypoeutectoid steels.⁴ While pearlite is not a single constituent, it may well be imagined to have an effect like that exerted by hypothetical similar grains of a strong solid solution. The structurally free ferrite is the continuous phase, in which the pearlite is scattered as disconnected islands. If the free ferrite were a structureless amorphous substance, the pearlite could produce only a mild strengthening effect, by a sort of frictional resistance to flow, but the ferrite is crystalline and yields only by slipping on its crystallographic planes of weakness, and such slip is opposed by the rigidity of the pearlite.

This mechanism of hardening, which has been described as the "obstruction principle," refers particularly to reinforcement of a continuous ductile matrix by grains of a stronger constituent which are similar in size to the grains of the matrix. The grains of the matrix are strengthened by *external* support. It has recently become evident that metals can be hardened to a still greater degree by a hard substance dispersed as fine particles *within* the grains.

AGING OF DURALUMIN

A very important incident in the development of the theory of hardening by hard substances highly dispersed is the study of the light aluminum alloys of the "duralumin" type, by Merica, Waltenberg and Scott.⁵ The following is typical of the composition of these alloys: Copper, 4.0 per cent; magnesium, 0.5; manganese, 0.5; aluminum (commercially pure), remainder.

These alloys in the rolled or forged condition can be very materially hardened by a heat-treatment consisting of quenching from about 500 deg. C., followed by aging for several days at ordinary temperatures. The hardness and strength immediately after quenching are

about the same as in the "annealed" condition, but on aging increase spontaneously about 40 per cent.

Merica, Waltenberg and Scott base their explanation of this hardening on the variation of the solubility of the compound CuAl_2 in aluminum with temperature. In Fig. 3 is reproduced a portion of the equilibrium diagram of the aluminum-copper system, showing the solubility curve of CuAl_2 in aluminum. It will be noted that the solubility of the compound decreases from about 4 per cent (copper) at 500 deg. C. to probably less than 1 per cent at room temperature. A piece of duralumin examined microscopically immediately after quenching shows a "solid solution" structure—that is, a structure free from visible particles of CuAl_2 . After the alloy has aged so that the hardness and strength have greatly increased, the structure is apparently unchanged. There is reason to believe, however, that there has occurred

FIG. 3. PORTION OF THE EQUILIBRIUM DIAGRAM OF THE Cu: Al SERIES SHOWING THE SOLUBILITY CURVE OF CuAl_2 IN ALUMINUM, ACCORDING TO MERICA, WALTENBERG AND SCOTT

during aging a precipitation of CuAl_2 in the form of particles of submicroscopic size, to correspond to the diminished solubility of the compound at the lower temperatures. Quoting from the paper referred to:

"Upon heating a specimen of duralumin that has been quenched from 500 deg. C., but not aged, an evolution of heat occurs at from 250 to 275 deg. C. . . .

"No thermal change takes place upon cooling the same specimen, provided it has not been heated beyond 520 deg. C. Upon reheating the same slowly cooled specimen, no evolution of heat is found corresponding to that upon the first heating. Without doubt, therefore, a chemical reaction takes place at 250 to 275 deg. C. upon heating the quenched sample with evolution of heat—i.e., indicating the formation of stable from unstable phases, not a transformation of stable to other stable phases, the two systems being in equilibrium during the transformation. Such a transformation must take place with heat absorption upon raising the temperature.

"A specimen that has been quenched and aged at from 100 deg. to 150 deg. C. to secure maximum hardness shows little or no evolution of heat upon heating. Whatever may be the chemical reaction that is indicated on the first heating curve of a quenched specimen, it has taken place during

⁴See discussion of the "obstruction theory" in "Metallography of Steel and Cast Iron," H. M. Howe.

⁵"Heat-Treatment of Duralumin," P. D. Merica, R. G. Wattenberg and H. Scott, *Bulletin A.I.M.E.*, June 1919, p. 913. *CHEM. & MET. ENG.*, vol. 21, p. 551 et seq.

the aging of the specimen, during which the hardening also occurs; stable phases have formed and the subsequent heating curve shows no arrest corresponding to that of the quenched specimen.

"This chemical reaction can hardly be other than the precipitation of CuAl_2 from its supersaturated solution in aluminum, although direct visual evidence bearing on this question is also lacking. . . .

"Although it cannot be directly proved that the thermal arrest at about 250 deg. C. noticed upon heating a quenched unaged specimen of duralumin is due to the precipitation of CuAl_2 , no evidence directly contradicts this assumption, which is in entire accord with our knowledge of the equilibrium within the alloy, and this arrest cannot be assigned to any other phase change.

"It has been shown by many previous investigations and confirmed by the authors that aluminum undergoes no transformation in the solid state between ordinary temperatures and its melting point. No other phase changes could occur in the main mass of duralumin, the grains of solid solution, therefore, except those of solution or precipitation of FeAl_3 , of the X compound, of CuAl_2 , of Mg_2Al_3 , or of Mg_2Si , within the grains. Aluminum, which contains the same amounts of FeAl_3 and of the X compound as does duralumin, is not altered by heat-treatment as is duralumin, nor does it show a reverse heat effect upon heating as does the latter. This heat effect must, therefore, be due to the precipitation either of CuAl_2 , Mg_2Al_3 or Mg_2Si . But the alloys containing only magnesium in amounts up to 3 per cent also do not harden upon aging. There remains only the precipitation of CuAl_2 with which to explain this heat effect.

"The theory outlined above of the mechanism of the hardening of duralumin during aging most readily explains the interesting fact discovered by Mr. Blough and confirmed by the authors that the amount of hardening during aging increases as the temperature of quenching increases. At higher quenching temperatures more and more CuAl_2 is dissolved in solid solution. After quenching, the CuAl_2 is in excess of its solubility; the higher the quenching temperature the greater is the excess, and this is precipitated during aging. The hardening is in proportion to the amount of the highly dispersed CuAl_2 formed.

"If this theory is accepted for the moment, it is interesting to consider the effect of degree of dispersion upon hardness in the case of a solid solution, in this case of CuAl_2 in aluminum. Duralumin immediately after quenching is generally softer than it is in the annealed condition. Thus alloy C-11, in the form of sheet, gave the following values of hardness:

	Annealed at 300°	Quenched, but not aged	Quenched, and aged 8 days
Scleroscope hardness, magnifying hammer..	17	16	35

"This is probably due to the fact that a specimen, as ordinarily cooled after annealing, still contains some dissolved CuAl_2 in excess of its solubility; the material hardens slightly during cooling. Specimens cooled extremely slowly give a scleroscope hardness of from 7 to 10, much lower than that of the quenched, unaged ones.

"Upon aging a quenched specimen at 200 deg. C., for example, the hardness first increases to a maximum and afterward decreases. During that aging there has been first a formation of fine nuclei of CuAl_2 followed by coalescence of these particles into ones of larger size. There is, therefore, a certain average size of particle of CuAl_2 for which the hardness of the material is a maximum; atomic dispersion of the solute, CuAl_2 , is not the dispersion that produces the maximum hardness, but some intermediate one between it and that at which the particles become visible by ordinary means."

An important point in this theory of the hardening of duralumin is the conclusion that there is a certain average size of particle which produces maximum hardness, any size either larger or smaller causing less hardness. This is opposed to the generally held idea that a given amount of a substance added to a metal produces the greatest possible hardening effect when it is in *solution*—that is, when it is in the highest possible state of dispersion. The degree of dispersion conducive to maximum hardness may conveniently be designated by the term "critical dispersion." Dispersions finer than this may be called "sub-critical," and those coarser "super-critical."

It is also important to note the magnitude of the hardening effect in duralumin. It is possible to increase the hardness of pure aluminum approximately tenfold by producing within grains of an aluminum-copper solid solution a critical dispersion of hard particles. This hardening cannot be referred to any of the mystic causes sometimes assigned in the case of steel. The only conceivable explanation is that it is due to the presence of a vast number of very small, hard particles dispersed throughout the grains of aluminum (which probably retain a little copper in true solid solution).

These conclusions regarding the hardening of duralumin naturally suggest seeking analogies in other alloy systems. Merica and his co-authors called attention to the case of steel, pointing out a similarity to duralumin in that the decomposition of a solid solution into particles of sub-microscopic size (ferrite and cementite) is involved and also in that some steels (very high-carbon steels and high-speed steels) shown on tempering an *increase* in hardness, followed by the usual decrease. The theory advanced for the hardening of duralumin did not include any explanation of the mechanism by which the particles of CuAl_2 cause hardness. Some conception of this mechanism is necessary to any extension of the theory.

The present authors have attempted to analyze the mechanism of this hardening effect, so that the necessary conditions could be defined for all cases. Such analysis involves the explanation, first, of how one constituent dispersed within another produces such great hardness, and second, of why there is a critical dispersion or size of particle which produces maximum hardness.

EASY SLIP IN MAGNETIZED PLATES

In duralumin we are dealing with an aggregate composed of a ductile, relatively weak matrix—aluminum—greatly strengthened by the presence of small hard *disconnected* particles of CuAl_2 . The strength attained in the duralumin must be derived from the inherent cohesion of the continuous aluminum matrix. There is no conceivable way in which a few per cent by volume of a strong constituent in disconnected particles could impart a new element of cohesion of the magnitude actually obtained. Their action must consist in rendering more effective the cohesion latent in the aluminum. The logical inference is that this is accomplished by the elimination of extended planes of weakness—that is, by slip interference.

In Fig. 4 is represented a section through a crystal, the fine parallel lines representing a set of planes of easy slip. It may assist in obtaining a concrete conception of the mechanical conditions to consider a stack of iron plates placed in a strong magnetic field at right angles to their surfaces. It would be very difficult to pull these plates apart by a straight tensile effort, but comparatively easy to separate them by sliding them over each other. This stack of plates presents a rather close analogy to the conditions obtaining in a ductile crystal, especially in that the forces which hold the atoms of a crystal together are probably electro-magnetic in character.

In separating the magnetized plates by a straight pull it is necessary to overcome the entire magnetic attraction at once, whereas in sliding the plates the magnetic force is overcome only at the edges and then gradually by small increments. The principal resistance due to sliding is the frictional resistance of the plates due to the pressure. In order completely to separate the portions of a crystal on opposite sides of a plane of slip by a direct tensile pull it would be necessary to break simultaneously all the atomic

bonds on the plane. This would require a force equal to the absolute cohesion of the metal. The two portions can move with respect to each other on the slip plane without permanent rupture of any considerable proportion of the atomic bonds. Of course, extended slip separates the atoms from their old neighbors, but cohesion bonds are established with their new neighbors. The separation of the magnetized plates by a direct pull results in a "brittle" fracture with a minimum work of rupture. When the plates are separated by sliding, the work of rupture is increased by an amount equal to the frictional losses. Similarly when a crystal is fractured in a brittle manner the work of rupture is a minimum, whereas in a ductile fracture the work of rupture is markedly increased due to the friction at planes of slip.

SMALL HARD PARTICLES ACT AS KEYS

Fig. 5 shows an ideal section through a crystal in which it is supposed that a hard, strong substance is dispersed in the form of substantially spherical particles. These particles are supposed to be about equal in size, but of course the circles cut by the plane of the section should be of different sizes according to the distance of this plane from the centers of the spheres. It will be noted that there is not a single plane of easy slip which does not encounter at least one of these hard particles. Under the action of an external load tending to produce slip along these planes, the hard particles must act as *keys*, mechanically obstructing any motion along the planes as a whole. The result is increased elastic limit, hardness and strength.

Now suppose all the hard particles to be gathered into a single large particle, as shown in Fig. 6. Although the size and strength of the "key" are greatly increased, there are many planes of weakness left without any reinforcement. The single large particle does not interfere with slip on these planes. It is easily seen that the strengthening effect of the hard particles increases with their *number* and not with their size. Even in case all possible planes of slip are keyed at some points, more effective slip interference must result from diminishing the size and increasing the number of the particles. We thus have the rule that the hardening effect of a given amount of hard dispersed substance is greater the smaller the particles. This rule must reach a limit as the particles approach atomic dimensions. We do not know how small a crystal may be and still possess the characteristic hardness and strength of the substance.

Let us consider the strength of true solid solutions or atomic dispersions from the point of view of the slip interference theory. Planes of weakness are present just as in the pure metal or solvent. At intervals the succession of atoms of solvent is interrupted by an atom of the solute. At each point where an atom of the solute occurs there is an increased bond, or, we might say, pressure, on the plane of

potential slip, due to the greater force of attraction between the unlike atoms. This constitutes in effect a key, very much as to do the crystalline particles of CuAl_2 in aluminum. The planes are seemingly "spot welded" together by the atoms of the solute.

The experimental evidence indicates that the formation of crystalline nuclei of CuAl_2 in duralumin, from the solid solution of copper in aluminum, causes an increase in hardness and strength. If the key action of the atomically dispersed copper were equivalent to that of the crystalline particles of CuAl_2 , we should not expect this to be the case, since the hardness should increase as the *number* of keys increases. It is quite natural to suppose that the attractive forces of the copper and aluminum atoms for each other are not brought fully into play until the atoms are arranged in their most stable arrangement—that of the compound. The key formed by the little group of aluminum atoms surrounding the copper atoms in the solid solution is more easily sheared through than is a particle of crystalline CuAl_2 . The critical dispersion for maximum hardness should therefore consist of the smallest possible particles having the characteristic crystallinity of the compound. If we classify particles according to their diameters in terms of atoms, the following probably represents approximately the sizes involved:

1 atom diameter	solid solution	somewhat hard
10 atom diameters	critical dispersion	hardest
1,000 atom diameters	smallest visible particles	somewhat soft

NUMBER OF KEYS IN A DURALUMIN CRYSTAL

Let us take for an example the hardness changes in a duralumin alloy containing 4.5 per cent Cu. This alloy would contain 2 atoms per cent of copper or 8.33 weight per cent of CuAl_2 assuming that all of the copper is present as that compound. This would be at most 5.4 per cent CuAl_2 by volume; actually it is less than that amount, inasmuch as some of the copper will always be in solution. When the worked alloy is heated to a temperature at which all of the copper is in solution and then quenched, the hardness will be about 80 Brinell. The copper is probably in atomic dispersion. On aging, the hardness can be increased to about 140 Brinell as the CuAl_2 precipitates and the particles reach critical size. By very slow cooling from high temperatures the hardness can then be reduced to about 50 Brinell. Such a hardness is produced only after the CuAl_2 particles have reached relatively large sizes.

Tensile strength varies with the hardness. The plasticity is the greatest in the freshly quenched condition and the least when the CuAl_2 particles are present in critical size. The high plasticity accompanying atomic dispersion of copper would be expected, because the areas of potential slip planes will depend on grain size only. The interference to slip is greater than in pure aluminum; it resides in the nature of greater pressure between the two slip surfaces, but the planes are relatively smooth.

An average sized grain of duralumin would have about 2,000,000,000 atoms of copper on each potential slip plane. Although we do not know exactly the percentage of the

FIGS. 4 TO 6

Fig. 4. Set of planes of easy slip in a crystal having no internal slip interference. Fig. 5. Slip planes "keyed" by hard particles. Fig. 6. Hard constituent gathered into a single large particle, leaving many planes, without reinforcement.

copper precipitating as CuAl_2 during aging, we can for convenience consider it as 75 per cent of that present. Assuming now that the CuAl_2 particles have reached an average size of one ten-millionth inch diameter there will still be 500,000,000 copper atoms on each of the above planes and in addition each plane will be keyed with the relatively hard CuAl_2 particles at 35,000,000 to 40,000,000 places. This condition corresponds nearly to critical dispersion. By the time the CuAl_2 particles have reached an average diameter of a hundred-thousandth of an inch, each of the above planes will be keyed in about 3,500 to 4,000 places; if the diameter were further increased one hundred times only about three planes cut of eight would be keyed at all!

The presence of a given amount of hard substance in large particles produces excess slip interference locally, but leaves portions of the metal in a weak condition. Cohesion of the mass as a whole is therefore gained by subdivision of the key material into many particles distributed as uniformly as possible. The weak links of the chain of slip planes are thus strengthened at the expense of the strong ones. Plastic deformation in such a material produces an intricate system of slip planes determined by the number and size of the particles. In many places the slip cannot follow the easy crystallographic planes, but is forced to take place in unfavorable directions. The quantity of dispersed substance may be so great that the resistance to slip becomes equal to or greater than the direct rupturing strength of the atomic bonds, and brittleness accompanied by relatively great hardness will result.

Fig. 7 is a micrograph of a high-carbon steel in which the cementite has been coarsely spheroidized. One can readily see what an intricate system of slip planes or flow surfaces must be produced in this structure by plastic deformation. Fig. 8 shows this structure at higher magnification (650 diameters) after plastic deformation. It will be noted that the slip avoids the cementite and that the surfaces of slip are rough. The appearance is intricate as opposed to the systems of regular slip planes in nearly pure metals shown below in Figs. 9 and 10. As compared to critical size, the particles of cementite shown in Figs. 7 and 8 are very coarse. Each of the larger particles of cementite shown in these micrographs would have to be subdivided into about 1,000,000,000 particles to reach critical dispersion. The intricacy of the system of slip planes would correspondingly increase.

ADHESION BETWEEN CONSTITUENTS

While the CuAl_2 and Fe_3C particles probably have rather strong adhesion for the aluminum and iron respectively, such adhesion need not obtain in order to produce hardening. Copper oxide often present in copper should have very little adhesion for the metal, but when it is present in the form of globules within the copper grains it produces a strengthening effect. Antisell⁶ states that 0.2 per cent (1.8 per cent Cu_2O) oxygen increases the tensile strength of annealed copper over 10 per cent. Figs. 9 and 10 show a small quantity of Cu_2O . The particle size is large as compared to critical dispersion. In fact there is no way known to produce a very fine dispersion of the Cu_2O , and hence we cannot greatly harden copper by its presence in relatively small quantities. It will be noted that the slip planes in Fig. 10 have a tendency to extend completely across the grains. Yet slip planes in general avoid the Cu_2O particles or are faulted or stopped by them.

This represents the first stages of slip interference.

Thorium dioxide probably has little adhesion for tungsten, but when 1.5 per cent by volume is present as particles within the grains the tensile strength is increased in the temperature regions within which the metal is ductile. The presence of the thoria also has

FIGS. 7 TO 10

the effect of increasing the tensile strength more for a given amount of working below the annealing temperature than in pure tungsten. The cases of Cu_2O in copper and ThO_2 in tungsten are important, because they give positive evidence of the strengthening effect of these mixtures in which a weakening might be expected due to decrease of the effective cross-sections of the metals.

In all of the cases mentioned above the hardness has been produced by dispersing *hard* particles within relatively large grains of metal. We should not expect *soft* particles to produce hardening, because the "keys" of soft substance would shear and thus assist rather than oppose slip. The term *soft* is used here in the relative sense only.

SIMILARITY OF MANGANESE STEEL AND DURALUMIN

The explanations of the hardening of duralumin and of hardening by grain refinement are so simple and logical that we should examine the phenomena of the hardening of steel from the same viewpoint. The fact that iron is capable of existing in at least two crystal-line forms makes it difficult to differentiate between cause and effect and to appraise the true significance of the "critical" changes. The case of duralumin might be equally difficult to understand if hardening by heat-treatment were accompanied by allotropic and visible structural changes. Hardening of duralumin does not involve an allotropic change, twinning, or even a refinement of grain.

Its study teaches us that a soft crystal of aluminum can be hardened by dissolving copper in it; that the aluminum-copper solid solution can be further hardened by the precipitation of some of the copper into minute particles of CuAl_2 ; that maximum hardness is produced when the precipitated compound is present in particles of a small (critical) size, certainly much less in diameter than 1,000 atoms; that when the particles become larger than the critical size the hardness decreases as the particle size increases. The percentage increase in the hardness of aluminum by proper alloying and heat-treatment is comparable to that obtained in iron by alloying with carbon and heat-treatment.

If manganese steel containing from 1.0 to 1.5 per cent C and 13 per cent Mn is quenched from a high temperature, the structure existing at the high tem-

⁶"Relationship of Physical and Chemical Properties of Copper," Frank L. Antisell, A.I.M.E., Bull. 157.

perature is preserved at room temperature. The result is an aggregate of grains of austenite, which is in this case gamma iron with the carbon and manganese dissolved in it. The hardness is about 160 Brinell, a very substantial increase over pure alpha iron (75). The austenitic structure is stable unless the manganese steel is cold-worked or heated. The hardness increases on tempering and may reach about 500 Brinell after suitable heat-treatment. As the steel hardens it becomes magnetic, but not in proportion to the increase in hardness—in fact most of the hardening occurs before the steel has reached 2 per cent specific magnetism⁷ and before there is much visible change in the structure of the austenite.⁸

If a piece of this steel be heated to 1,100 deg. C. and cooled slowly, a network of carbide, presumably a mixture or solution of cementite and manganese carbide, is formed. Austenite at temperatures around 400 to 600 deg. C. is supersaturated with carbon, since the carbides precipitate around 500 deg. C. into particles large enough to be seen with a microscope.

Since the dispersion of the carbon is atomic in the austenite, it does not offer maximum interference to slip. The austenitic manganese steel is therefore relatively soft and ductile: the carbon dispersion is subcritical. The formation and precipitation of carbides into particles of visible size show that every size between molecular and visible must have obtained at some previous stage. The critical size or dispersion must have been reached prior to the appearance of the visible particles. Carbide of iron is magnetic and hence slight magnetism might appear on annealing, accompanied by a considerable increase in hardness, without producing a transformation of any appreciable amount of austenite into alpha iron. This latter transformation proceeds slowly, however, and its effect is superimposed on that resulting from the carbide precipitation.

Transformation into alpha iron produces an entire change in structure and a decided increase in magnetism, but the hardness may increase or decrease. Extended exposure to temperatures around 650 deg. C. eventually produces softening.

It is thus seen that in the early stages of hardening manganese steel the changes are strikingly similar to those found in the hardening of duralumin.

GRAIN REFINEMENT IN QUENCHING STEEL

There is an important factor accompanying the changes from austenite to granular pearlite which is absent in duralumin—namely, change in grain size of the matrix. When pure iron is quenched from above 900 deg. C., the ferrite grain size is smaller than that produced by slow cooling. As the carbon content is increased the ferrite grain size produced by quenching from above the upper critical progressively decreases. When the carbon content exceeds about 0.2 per cent the structure may all be martensite, in which the iron exists in the crystalline magnetic (alpha) state, but in most cases no definite grains of ferrite can be detected under the microscope.

As pointed out previously, reduction of grain size is itself an important factor in hardening. The quantitative significance of sub-microscopic grain size has been no better understood or appreciated than that of reducing dispersed particle size to approach atomic dimensions. By extrapolation in Mathewson's⁹ formula it is found that the hardness of alpha brass could be increased to 300 Brinell (nearly twice the hardness of cold-worked alpha brass), if

a grain size of about $\frac{1}{250,000}$ in. diameter could be produced. Each grain would then comprise about 100,000,000 atoms. There is no way known to produce such fine grain size in alpha brass and consequently we cannot develop such hardness. The results given above on tungsten, molybdenum and nickel indicate, however, that this figure is probably not higher than the absolute cohesion of the alloy. According to the general proposition that the absolute cohesion of a pure metal is sufficient to account for the hardening produced in alloys of that metal, it should be possible to produce hardening by reduction of grain size alone to an extent comparable to that produced by the critical dispersion of hard particles in relatively large crystals.

The change of properties of the nickel-iron alloys by heat-treatment is of especial importance in connection with the effect of change of grain size alone. An iron-nickel alloy containing 7.54 per cent Ni, 0.09 per cent C and 0.04 per cent Mn had its strength more than doubled by quenching from a dull red heat.⁹ Edwards concludes from a general review of the work on iron-nickel alloys that the presence of carbon is not necessary in order for such hardening to take place on quenching. Nickel lowers the transformation temperature of iron to such an extent that the quenching of a 7.5 per cent nickel alloy produces great grain refinement. The quenched product might be termed a carbonless martensite. Thus we have in certain iron-nickel alloys without carbon marked hardening accompanied by a great reduction in grain size. This is a simple case where the hardening is due to one factor—namely, reduction of grain size—whereas in duralumin and probably in the first stages of the hardening of manganese steel this factor does not enter, the hardening being attributable to a fine dispersion of hard particles within ductile crystals. These two factors may occur simultaneously in ordinary steels, making possible the many variations in their properties by heat-treatment.

MARTENSITE IS ALPHA IRON

In austenite we assume that the carbon is quite uniformly distributed in atomic dispersion. When austenite is quenched to form martensite, the short time and low temperature of transformation favor the retention of a large amount of the carbon in atomic dispersion in the ferrite. The transformation of austenite at A_1 under equilibrium conditions involves a change of the gamma iron to alpha iron and the combination of the carbon with iron to form cementite (Fe_3C). The latter would not form unless the iron changed its crystal structure. Therefore the allotropic transformation of the iron is the cause and the formation of cementite is the result. The change in iron involves no substantial migration of atoms, while the formation of cementite does. The logical order for the transformation to take place in eutectoid and hypo-eutectoid steel is first the iron transformation and then the cementite formation. When austenite is slowly cooled through A_1 , the two changes occur so close one after another as to be called simultaneous. When the cooling rate is proper to form troostite, physico-chemical equilibrium but not structural equilibrium results—that is, the ferrite and cementite both form but in such small particles that heating to temperatures slightly under A_1 (500 to 700 deg. C.) causes marked structural change.

When the cooling rate of the austenite is sufficiently rapid to form martensite, the transformation of the gamma iron to alpha is substantially complete, whereas the formation of cementite is not complete.

⁷Iron equals 100 per cent.

⁸"Metals and the Common Alloys," S. L. Hoyt, pp. 347-349.

⁹"Physicochemical Properties of Steel," C. A. Edwards, p. 164.

Martensite should therefore consist principally of sub-microscopic ferrite grains containing carbon in solution. The carbon content of the mother austenite will strive to precipitate as particles of Fe_3C , and the extent of this reaction will depend on the temperature-time conditions during quenching, aging and tempering.

The following are the reasons for concluding that the formation of martensite from austenite represents a change from gamma to alpha iron:

1. The complete change in microstructure of martensite, as compared to that observed when austenite is preserved on quenching, indicates a transformation of gamma iron.

2. The magnetism of martensite suggests the presence of crystalline magnetic (alpha) iron.

3. The X-ray spectrometer proves that alpha iron is the chief constituent of martensite. Steels which are non-magnetic show face-centered cubic lattices with the X-ray spectrometer, whereas martensite, which is magnetic, shows a body-centered cubic lattice. A 1.5 per cent C steel quenched from above the critical in iced brine showed both martensite and austenite under the microscope, and the X-ray spectrometer pattern showed both face- and body-centered lattices. A 0.35 per cent C steel quenched from above A_c showed only martensite under the microscope and only a body-centered lattice with the X-ray spectrometer.¹⁰

There are other considerations which suggest that the transformation from austenite to martensite represents a substantially complete change from gamma to alpha iron, but in view of the definiteness and finality of the results of the X-ray spectrometer, no other evidence need be considered.

MARTENSITE CRYSTALS ARE SUBMICROSCOPIC

Having established the fact that martensite consists chiefly of crystalline iron of the alpha modification, we conclude that the ferrite is present in grains of sub-microscopic size for the following reasons:

1. The conditions obtaining at the time of the formation of martensite are conducive to the production of small grains.

2. In low-carbon martensite formed from coarse grained austenite, ferrite can often be seen under the microscope in the form of very small plates.

3. In higher carbon steels which are conducive to the formation of finer grains on quenching, no ferrite can be resolved under the microscope.

4. In order to obtain a good Hull pattern¹¹ with the X-ray spectrometer it is necessary that the specimen be fine grained. In a 0.35 per cent C martensite, formed by quenching from 1,300 deg. C., the alpha iron pattern was typical of that obtained from fine-grained metals, even though the austenite grains from which the martensite was formed were large enough to be seen with the unaided eye.

It is not to be understood that the ferrite grains in martensite are necessarily equiaxed. The conditions obtaining during their formation are conducive to the production of very small plates of ferrite running parallel to the cleavage planes of the austenite. Whether the grains are substantially equiaxed or in plates, the precipitation along the austenite cleavage planes gives rise to the acicular structure of martensite. The tendency for this cleavage precipitation is so marked that martensite formed by quenching large grains of austenite appears under low magnifications to have a grain structure similar to that of the austenite. Detailed examination, however, reveals the fact that the

austenite grain structure is entirely replaced by a structure so fine that it is often impossible to find a single crystalline particle large enough to see with a high-powered microscope. The apparent crystalline masses observed after light etching are seen to be, after deep etching, complexes of very fine structure.

NO CEMENTITE IN MARTENSITE

The reasons for concluding that the austenite-martensite transformation does not represent a complete formation of the cementite are: (1) The heat evolved when martensite changes to troostite. (2) The failure to detect the presence of cementite in untempered martensite by magnetic analysis.¹² (3) The etching characteristics of martensite as compared to troostite suggest that the carbon is in solution in the former and is largely present as cementite in the latter.

The authors believe that it is the carbon rather than the carbide in solution in the ferrite of the martensite for the same reason that they believe that it is the carbon and not the carbide which is in solution in austenite. Cementite can form in martensite only by the migration of carbon atoms. In order for these to migrate freely they cannot maintain contact with any particular iron atoms. In freshly formed martensite therefore most of the carbon should be atomically dispersed, but a small amount may actually be in the form of particles of cementite. The presence of the carbon assists in the hardening indirectly by helping to produce a very fine ferrite grain size and directly by strengthening the ferrite grains.

Although the ferrite of the martensite is held to contain carbon in solution, it is considered that the fineness of grain is chiefly responsible for the hardness.

Great hardening can be produced with 0.40 per cent C, which is 1.9 atoms per cent. No case is known with large-grained metals where 1.9 atoms per cent of one element dissolved in a metal produces hardening at all comparable with that of a 0.40 per cent C martensite. In austenitic manganese steel there may be as much as 7 atoms per cent of carbon and 13 per cent manganese (by weight) dissolved in gamma iron without producing marked hardness. The structure in this case is coarse grained. It may be argued that 0.40 per cent carbon produces 6 per cent of cementite and that it is this compound which is in solid solution in the ferrite. The same argument applies to manganese steel which would have over 20 per cent of cementite in solid solution. If, therefore, we assume solution of the carbon in the ferrite of the martensite it follows that the grain refinement must be the principal cause of the hardness. Experimental evidence points conclusively to a super-refinement of the ferrite grains and favors the conclusion that the greater part of the carbon has not formed into carbide.

The hardness of martensite may therefore be attributed chiefly to a combination of two factors—namely: (1) The super-refinement of the ferrite grains, and (2) the strengthening of the ferrite by carbon.

Too little is known regarding the exact sequence of hardness changes on tempering quenched carbon steels. The most marked effect is one of softening, and the opinion is fairly general that softening is progressive throughout the whole range of tempering temperatures. It is certain that the tempering of hardened tool steel at temperatures above 200 deg. C. reduces its cutting hardness and probably also its Brinell hardness. The Shore scleroscope hardness of tool steel seems to be less affected by tempering at low temperatures. It is likewise quite certain that steels of medium carbon content which have been hardened are softened by tempering at temperatures above 350 deg. C., as proved by thou-

¹⁰Preliminary results of work done by Jeffries and Bain.

¹¹"The Crystalline Structure of Metals" by Jeffries and Archer, CHEM. & MET. ENG., vol. 24, p. 776 (May 4, 1921).

¹²K. Honda, "On Magnetic Analysis as a Means of Studying the Structure of Iron Alloys," *J. Iron & Steel Inst.*, No. 2, 1918, pp. 375-419.

sands of tests on hardness and tensile strength. The hardness of low-carbon steels is known to be not greatly changed by tempering, and the changes brought about by tempering above 500 deg. C. are certainly in the direction of softening. Steels of the various carbon contents are seldom tempered commercially at temperatures below those which produce easily measureable softening. There is, therefore, a lack of results of commercial practice in the tempering of hardened steels at very low temperatures.

It is stated by Heyn and again by Boynton that tempering, even in its early stages, gradually reduces the hardness of martensite. Heyn's conclusions are drawn from scratch hardness tests on high-carbon steel. Among the few published contributions on this subject is a paper by C. Grard¹³ in which it is reported that the first effect of tempering is to *increase* the hardness.

FIG. 11. EFFECT OF TEMPERING ON THE HARDNESS OF HARDENED STEEL (GRARD)

His results are plotted in Fig. 11. They are described as typical of the steels of the classes named. No analyses are given.

While Grard's curves are opposed to general opinion, it is believed that they merit serious consideration as representing perhaps an overlooked phenomenon in the tempering of steel. He appears to have made a particular point of the accuracy of his hardness determinations. These were also confirmed, in the case of the soft and semi-hard steels, by tensile strength results which parallel the hardness results closely; hard steels were too brittle for satisfactory tensile tests after low tempering temperatures. It is to be noted that the maximum hardness attained on tempering occurs at a lower temperature the higher the initial hardness. Marked softening also begins at lower temperatures the higher the initial hardness.

According to the critical dispersion ideas the precipitation of cementite in martensite should produce an increase in hardness. Cementite meets all of the requirements of a good "key" material.

At some stage in the formation and growth of cementite particles, conditions would be proper to produce maximum hardness. It is not probable that all of the cementite particles have critical size at the same time. At any given time in the first stages of tempering, some particles should be super-critical, some critical and some sub-critical. It must be considered also that alpha iron

has some solvent power for carbon under equilibrium conditions; all of the carbon therefore cannot form into cementite.

After the cementite formation has progressed nearly to completion the larger particles grow by absorbing carbon in solution in the ferrite. The ferrite will be supersaturated in carbon with respect to large particles and saturated with respect to small particles of cementite. The precipitation of the carbide on the larger particles produces a condition of undersaturation with respect to the smaller particles which then are dissolved. The carbon atoms diffuse toward regions of low concentration, which is toward the larger particles.

Growth of cementite crystals during tempering is favored by long time and high temperature. The successive stages of troostite, sorbite and granular pearlite represent in part progressive increase in size and decrease in number of the cementite particles.

CHANGES IN FERRITE ON TEMPERING

As the carbon changes noted above are progressing there must be some change in the ferrite. In the case of a steel containing 1 per cent carbon the formation of cementite will require about 15 per cent of the iron. This iron must be supplied from the ferrite or from any amorphous iron which may be present. Such a change would tend toward a more perfect equilibrium in the ferrite which would tend toward softening. It seems certain that the growth of the ferrite into larger particles at temperatures from 350 to 550 deg. C. is an important factor in the decrease of hardness. The effect of changes in the ferrite caused by low-temperature tempering (below 300 deg.) is small, but even this becomes appreciable in the harder martensites.

Martensite cannot be hard without being fine grained and in general the greater hardness will be produced by the greatest grain refinement. The finer the grains the lower should be the temperature at which structural changes begin on tempering, and hence this factor should cause martensite to soften considerably by prolonged heating at temperatures well below 300 deg. C.

The first stages of the tempering of martensite therefore involve two opposing factors; the changes in the ferrite tend to produce softening while the first precipitation of the cementite tends to harden. We might expect an increase or decrease in hardness according to the rapidity and extent of these opposing changes.

If low-temperature tempering does not produce a change in hardness, it should not be prematurely concluded that no internal changes had taken place. It is quite conceivable that in Prof. Campbell's¹⁴ steels heated twelve hours at 100 to 108 deg. C. the hardness changes were insignificant, yet the electrical resistivity had decreased 25 per cent. Such a change is consistent with the breaking down of a solid solution into two constituents. The extensive work of Barus and Strouhal¹⁵ also shows that even heating for an hour at 66 deg. C. produces internal changes in hardened steel. A structural change and change in electrical resistivity might obtain and the hardness might increase, remain constant or decrease in accordance with the relative magnitude of these opposing factors.

Any austenite which may be present in a quenched steel will further complicate the results produced on tempering. The transformation of austenite on heating is always accompanied with hardening. As a rule the lower the temperature at which the transformation will take place the harder will be the transition product. Mauer¹⁶ found, for example, that austenite containing 1.94 per cent C and 2.24

Mn transformed at 400 deg. C., while a steel containing 1.66 per cent C and having a structure of two-thirds austenite and one-third martensite showed the transformation at 250 deg. C. The latter had very much higher maximum hardness. This accords with the observation that austenitic manganese steel transforms only at a relatively high temperature and never attains extreme hardness.

NATURE OF TROOSTITE AND SORBITE

The constituents troostite, sorbite and granular pearlite represent different degrees of subdivision of the ferrite grains and the cementite particles. As the tempering temperature is increased up to A_1 and as the time of exposure at temperature increases the ferrite grains and the cementite particles become larger. These two factors now combine to soften and weaken the steel. The slip interference theory discussed above explains nicely the decrease in hardness as the constituents become coarser. The hardness of a tempered martensite will be affected indirectly by the quantity of carbon, because cementite opposes ferrite grain growth, and directly by the slip interference caused by the cementite. It is because the presence of carbon has this double (direct and indirect) hardening effect that the physical properties of heat-treated steel vary so much with change in carbon content and with change in heat-treatment. For example, pure iron has a hardness of about 75 Brinell, whereas troostite containing about 0.9 per cent C may have a hardness of 500. The hardness of the troostite is due partly to the mere presence of cementite and partly to the ferrite grain refinement caused by the cementite.

Obviously the alloy steels are more complex than the carbon steels. In general the hardening alloy ingredients help to produce martensite at slower rates of cooling than would be possible in carbon steels. They also strengthen the ferrite by their presence in solid solution and may change the nature and degree of dispersion of the hard particles that are produced on tempering.

RESTATEMENT OF THEORY

Although there is substantial agreement among metallographists regarding the nature of troostite, sorbite and granular pearlite, there has been a constant controversy for the last thirty-five years regarding the nature of martensite. Many theories have been put forward and volumes have been written on this subject.

No attempt will be made here to discuss these various theories. It may be mentioned that the authors made their analysis of this problem without consideration of any of the current theories. While the conclusions reached regarding the nature of martensite do not correspond completely to any current conception, they correspond in the main to a combination and extension of the ideas of Grenet¹⁷ and M'Cance.¹⁸

Owing to the X-ray spectrometer results the conclusions regarding the allotropic changes can now be considered as established. It is obvious that the "beta iron" theory has little foundation. Even if beta iron is a true allotrope there is no evidence that it is hard or that it is present in martensite. The theory advanced by Edwards and Carpenter¹⁹ that martensite represents

twinning in gamma iron is also untenable, for the reason that martensite consists chiefly of alpha iron. The "solid solution" and "carbon" theories are unsatisfactory, because they are indefinite and incomplete.

The ideas regarding the nature of martensite presented in this article not only accord with observations of fact and fulfill the requirements of logic and simplicity, but a concrete mechanism is put forward showing how the structures postulated are able to account for the hardness of quenched steel and the changes in properties on tempering.

SUMMARY

A complete theory of hardening must explain hardness in non-allotropic metals, a task which has been attempted in the preceding pages, and is summarized below:

1. The inherent cohesion of the pure metals is far in excess of values obtained for tensile strength.
2. Mechanical failure under stress is ordinarily premature because of the presence of crystallographic planes of weakness, or potential slip planes.
3. Any structural condition which interferes with slip on these planes of weakness increases the strength and hardness of the metal. Furthermore, every known method of hardening metals can be referred to this principle of "slip interference."
4. In a pure metal the most simple source of increased hardness is grain refinement, which introduces slip interference at the grain boundaries due to the different orientations of the adjacent grains, and, especially in fine grained metals, to the disorganized or amorphous metal between the grains.
5. Cold-working introduces slip interference by the fragmentation of the grains and the production of amorphous metal.
6. The hardness and strength of amorphous metal itself is due to the absence of the planes of weakness characteristic of crystals.
7. Slip within grains is opposed by the presence of a strong constituent at the grain boundary, providing that if the strong constituent is brittle, its shape and size are not such as to lead to effective weakness due to eccentricity of loading.
8. Effective hardening is obtained by slip interference within the grains, due to the presence of hard constituents uniformly distributed in the form of very fine particles.
9. It is not necessary that the hard constituent possess great adhesion for the matrix.
10. The effect of a given amount of hard constituent increases with the fineness of subdivision, reaching a maximum at an average particle size denoted by the term "critical dispersion." The critical dispersion probably consists of the smallest particles having the characteristic properties of the crystalline substance. The order of magnitude of the diameter of such particles is probably about 10^{-7} cm. A higher degree of dispersion, particularly the atomic dispersion of solid solutions, is less conducive to hardness.
11. Corresponding to the maximum hardness at critical dispersion, there is a minimum in ductility.
12. Increase in the amount of dispersed substance produces increased hardness, but the brittleness also increases, so that there is a limit to the useful hardness and strength that can be obtained.
13. The amount of hard dispersed substance which produces the greatest useful strength increases as the size of particle increases.
14. The actual amounts of hard dispersed substances which produce useful results are from about 2 to 15 per cent by volume.
15. The only manner in which the high degrees of dispersion desired are produced consists in the limited decomposition of solutions, and in particular of solid solutions.
16. Martensite consists of a solid solution of carbon in very fine-grained alpha iron. The hardness is due chiefly to the grain refinement of the ferrite, but partly to the carbon in solution.
17. The tempering of martensite involves two changes: ferrite grain growth and the precipitation and growth of cementite particles. Ferrite grain growth causes progressive softening. The precipitation of cementite causes hardening, but the growth of the particles above the critical size produces softening.

A Simplified Carbon Combustion Train

BY W. W. BOONE*

THE estimation of carbon in steel has probably attracted more attention than that of any other element, due to its far-reaching influence upon the properties of the steel. At present the three most general methods used are: (1) Color comparison; (2) direct combustion; (3) wet combustion. For all ordinary steels the direct combustion of the steel in a current of oxygen is the most rapid and accurate method known. The color comparison method is very inaccurate in many cases, and the wet method entails the use of bulbs and apparatus too fragile and delicate for technical purposes.

In designing a simplified combustion train the writer has endeavored to eliminate all non-essentials for ordinary steel analysis, and at the same time make the train as nearly foolproof as possible. The apparatus is shown in the accompanying figure.

In most trains the flow of oxygen is regulated by means of a reducing valve and mercury pressure gages.

SIMPLIFIED CARBON COMBUSTION TRAIN

This scheme, however, requires frequent juggling of the reducing valve during the same determination, especially during the period of combustion, and hence the pressure and flow vary considerably.

By the insertion of a water-pressure tank a practically uniform pressure is maintained throughout the combustion. This tank is of galvanized iron 12 in. in diameter and 36 in. in height, with an open top. Another shell 30 in. in height telescopes into the first tank and is fastened securely in position by means of a rod imbedded in the larger tank. When water is poured into this tank so that it is approximately half full an airtight seal is produced. The idea for this tank originated from an ordinary acetylene generator.

Oxygen is admitted through the inlet *X*, thus causing the water to rise around the inner shell. When *X* is closed and *O* is opened, the oxygen in the tank flows out under the pressure of the column of water. One filling of the tank provides enough gas for four or five six-minute combustions. From the water tank the oxygen passes through two bottles, one acting as a safeguard against possible sucking back in the system, and the other containing a saturated solution of potassium hydroxide, which filters and dries the gas bubbling through it. The oxygen is subjected to final drying in a tower containing 20-mesh calcium chloride (*A* and *B*), 20-mesh sodium calcium hydrate (*C*) and concentrated sulphuric acid (*D*). After leaving the combustion tube (silicon) the gas passes through tubes containing: granulated zinc (*G*), 20-mesh calcium chloride (*E*),

phosphoric anhydride (*H*) and 20-mesh calcium chloride (*F*). The zinc takes care of any sulphur gases which might have been formed in the evolution, the calcium chloride and phosphoric anhydride acting as drying agents before the gas enters the absorption bulb. Usually three special tubes are placed between the absorption bulb and the combustion tube; one for the calcium chloride, one for the zinc, and one for the phosphoric anhydride. This entails more costly and elaborate apparatus and requires more time for packing. The one simple tube containing all the necessary purifying agents in the minimum of space works excellently under heavy working conditions. Flemming or similar absorption bulbs packed in the usual way may be used as absorption media.

MANIPULATION OF THE METHOD

A factor or a half factor weight (usually half factor is sufficient) of fine steel drillings is placed in a Johnson clay boat lined with RR alundum. These factor weights for carbon may be purchased, respectively, 2.7273 g. and 1.3636 g. and were used in order to eliminate reference to tables or calculation for the carbon percentage present. Gas is allowed to flow through the hot furnace for some time, to insure the removal of all CO_2 before the combustion is begun. A weighed absorption bulb is now fitted into place and the upper stopcock opened. The boat containing the sample is pushed into the middle of the combustion tube, the entrance stopper replaced and oxygen admitted. The lower stopcock of the bulb is now opened and the combustion is run for six minutes. At the end of this period the upper stopcock of the bulb is closed, then the lower stopcock, and the bulb is disconnected for weighing. The lower stopcock is momentarily opened to release the pressure in the bulb before weighing, the oxygen is now shut off and the boat containing the burned sample removed from the furnace. Any moisture or dust adhering to the bulb is carefully removed with a silk handkerchief and the bulb is weighed against a tared bulb. The gain in weight is the percentage of carbon, since a factor weight was used. It is merely necessary to place the decimal point two places to the left in the case of a four-place weight.

With two furnaces in use, one balance for weighing samples and one for weighing the absorption bulbs, the writer frequently carried out seventy to seventy-five determinations in eight hours.

With low-carbon steels it is sometimes necessary to preheat the sample in order to obtain a perfect fusion. Two minutes' preheating is usually enough, and in such case the entire combustion should still occupy but the six minutes with a full factor weight and the five minutes with a half factor weight. This method gives accuracy to 0.01 per cent.

Artificial Iron Ore for Hydrogen Generation

An artificial iron ore has been developed by the Bureau of Standards for use in the steam-iron process of hydrogen generation. This material is made by impregnating a porous earthenware supporting body of approximate shape with iron nitrate and decomposing it to the oxide. Laboratory experiments on a limited scale indicate that this material is far superior to a natural iron ore for the purpose of producing hydrogen. The bureau is about to undertake the production of a sufficient amount of this material to permit of extensive tests in the hydrogen plant at Langley Field.

Injuries Caused by Emergencies

BY CHESLA C. SHERLOCK

MOST employers are familiar enough with the workmen's compensation laws to know that they are liable for the payment of compensation to injured workmen who receive their injuries through accidents arising "out of and in the course of" the employment.

Those employers who are operating under the common law theory of damages, and there are thousands of them, even in the states having compensation laws, know that they are not liable for accidental injuries caused to their workmen, unless the fault for the accident rests in the negligence of the employer in some particular. In spite of these provisions, there is one exception to the two rules mentioned above, which apply in all cases of accidental injury, whether the employer be operating under the compensation system or under the common law theory, and that is where emergencies arise which cause the injury to the workman.

A CONCRETE ILLUSTRATION

Suppose, for the purposes of clearly illustrating this rule of law, that we take a concrete illustration embodying the essential features of the rule, which is common to the experience of employers generally. Let us suppose that the case arises in the factory of a chemical company, and that it arises through the agency of an explosion of chemicals.

A workman, John Doe by name, has been asked by his foreman to repair a leak in the gas tank of one of the company's automobiles. John removes the tank from the car, and carefully empties it of all the gasoline which it contains. He then takes the tank to a bench in one corner of the packing room and commences to heat a bit of solder with a blow torch.

In the office is one of his pals, a buddy he had known overseas, whose avowed duty it is, under the terms of his contract of employment, to take care of the office force. This man, Fred Jones by name, is not engaged in a hazardous occupation and is not covered under the terms of the workmen's compensation acts as they are generally understood. The employer does not even pay a premium on his risk.

As soon as John Doe, out in the packing room, applies his torch to the solder and moves it in close proximity to the hole in the gas tank, there is a terrific explosion, which not only kills John Doe, but scatters flames in every direction and severely burns another employee.

Fred Jones, who is working in the office, hears the explosion and sees his pal topple over. In his excitement he rushes through the office door in an effort to rescue him. But he is met by a scorching sheet of flame which drives him back. In his terror he realizes that the fire department must be summoned immediately or the entire plant will shortly be destroyed by the possible explosion of other chemicals stored in the packing room awaiting shipment.

RUN DOWN RUSHING TO FIRE ALARM BOX

He turns and dashes into the office and out the front door. He does not summon the fire department by stopping in the office and calling Central as he might do, and probably should do. Instead, he remembers in that brief moment of terror that there is a fire-box alarm on the corner across the street, and he makes for that place.

Impelled by the sudden emergency which looms all-

terrible in his mind, he does not look this way or that and before he reaches his destination he is struck by a delivery truck and seriously maimed and injured.

The cooler heads in the packing room, in the meantime, through the use of fire extinguishers close at hand, have put out the blaze and forestalled the threatened conflagration. John Doe's body is removed to an undertaking establishment and Fred Jones and the other employees are taken to the company hospital.

In the course of time, the employer sends in a claim for compensation not only for the workman who was injured through burns, but for Fred Jones as well. "I realize," he said, in making the claim to his insurance carrier, "that I have not paid a premium on the risk for Fred Jones, but I feel that he has a right to compensation under the law, and since by the terms of your policy you agree to hold me blameless for any and all claims of such nature and should have anticipated such a case, I have no hesitancy in claiming relief for Jones."

INSURANCE COMPANY DENIES LIABILITY

A few days later an adjuster for the insurance company stepped off the train and made his way quietly to the chemical factory. He talked to a few workmen on the premises before he went to the office of the employer.

"I am authorized to make settlement in the cases caused by your recent explosion," he said, "but I am not prepared to accept liability in the case of Fred Jones. I have carefully investigated the circumstances surrounding his injury and I do not feel that he has a compensable claim."

"But," interrupted the employer, "how do you reach such a conclusion? His injury was clearly caused by the explosion. If he had not rushed across the street to turn in a fire alarm, he would never have been injured."

"That is true," replied the adjuster, "but when he went across the street he was outside the scope of his employment. His injury arose absolutely from causes entirely foreign to the duties of his employment, which were to manage this office force. And, besides, clerks and office people are not entitled to coverage under the terms of the workmen's compensation acts."

"Yes," agreed the employer, "but one of his duties was to do all that he could to preserve this business against loss. He was clearly acting for my welfare when he attempted to turn in a fire alarm and was clearly acting for my best interests. Technically, of course, he was not managing my office force then, but do you mean to say that the law is as narrow as all this? I thought that the compensation system prided itself on being free from technicalities."

The adjuster was firm in his position. "I can do nothing but refuse to pay compensation to Jones, until the Industrial Commission orders me to do so. Of course, if Jones wants to go to bat on this, he has the right and we will get the benefit of an official ruling on the case."

The employer's jaw snapped. "All right, I shall advise Jones to do that very thing, as soon as he is able, and I am going to give him all the legal assistance I have at my command!"

JUDGMENT AGAINST INSURANCE COMPANY

In the course of time Fred Jones did bring an action against the insurance company for compensation and it was tried before an arbitration committee composed

of one Industrial Commissioner and two other arbitrators selected by the parties. The Commissioner wrote the following opinion, which was the unanimous decision of the committee:

"It is true that Fred Jones was technically outside the scope of his employment when he rushed across the street to send in a fire alarm. He was not even on the employer's premises and the accident that caused his injury did not arise out of the duties he was required by his employment to perform. But in this case a sudden emergency was presented upon which he acted, presumably with the idea of best promoting his employer's interests. And while in the course of that intention he suffered his loss and the impairment of his earning capacity.

"The emergency rule of law holds that an employee may be even guilty of an error of judgment, and still be entitled to relief from his employer for injuries sustained. Jones, it might properly be urged, should have used the telephone in his office to summon the aid of the fire department. He was, perhaps guilty, of an error of judgment in dashing into the street, and thereby receiving injury to himself, but the law throws the mantle of protection over him in such circumstances, and this is true, whether we view the matter from the common law standpoint or from the compensation angle.

"As to the question of whether Jones should be denied compensation because he was technically not covered under the employer's policy of insurance, it is well settled that mere failure to include all risks in a policy does not absolve the parties from liability. Such a construction might properly be urged to defeat the whole system of compensation liability, and we feel that the best interests of the parties are promoted by awarding the claimant the relief he seeks."

It is not necessary to elaborate further, except to state that the emergency rule of law is a general rule and that it will apply to all employers, regardless of whether they are operating under one system or the other. It is one of the very few rules of law approved by the common law system which has been preserved in the compensation system of compensating injured workmen.

Wooden Posts for Plant Inclosures*

With the increasing necessity for proper protection of chemical and industrial plants by inclosing the property with wire or board fences the question frequently arises as to the right type of wooden posts in fence construction. The fact is, there is no choice between round or split posts if the amount of heartwood is the same in both. But if the percentage of sapwood is increased by splitting, the split posts will be less durable, and if the percentage of heartwood is increased, it will be more durable than a round one. Posts of spruce, hemlock or any of the true firs are exceptions to this rule, because their heartwood and sapwood are equally durable.

When posts are to be treated with creosote or other preservative, a round post is preferable to a split post, because of the comparative ease with which the sapwood can be treated. The heart faces on split posts do not, as a rule, absorb preservative well. Split red-oak posts will take treatment, because the wood is very porous, but the heart faces of split posts of many other species, notably white oak, red gum and Douglas fir, resist the penetration of preservative, even under heavy pressure.

Progress of Belgian Chemical Industry

The Belgian chemical industry is composed of a Federation des Industries Chimiques de Belgique, which is subdivided into a series of fifteen associations, says a recent consular report. The information for certain associations is missing or incomplete, but the following figures relate to the production of those for which figures could be obtained by the Ministry of Economic Affairs:

Products	Metric Tons	
	1913	1920
Soda, potash and derivatives:		
Carbonate of soda.....	31,234	31,000
Caustic soda.....	3,261	2,418
Chloride of lime.....	7,444	3,970
Chloride of calcium.....	6,025	2,850
Potash and derivatives.....	47,964	40,229
Acids, minerals and derivatives:		
Sulphuric acid.....	600,000	400,000
Nitric acid.....	10,000	7,500
Hydrochloric acid.....	22,500	27,000
Sulphate of soda.....	25,000	40,000
Superphosphate of lime.....	465,000	220,000
Wood products for distillation, cubic meters	46,000	21,000
Products of coal distillation:		
Alkali.....	1,500	894
Anhydrous ammonia.....	40	62
Sulphate of ammonia.....	22,696	9,048
Benzene, 90 per cent.....	5,216	4,194
Coal tar.....	37,337	25,872
Naphthalene.....	5,593	4,702
Creosote oil.....	8,705	5,543
Tar.....	47,106	28,304
Light oils.....	6,277	1,785
Powders and explosives.....	3,500	2,200

The present production of artificial silk is about 70 per cent of what it was before the war.

Gas-Fired Crucible Furnaces

Before the Sheffield Society of Metallurgists and Metallurgical Chemists, on April 19, F. M. Parkin, of Hobson, Houghton & Co., advocated the use of gas-fired furnaces for melting crucible steel as being superior in all respects to the coke-fired furnaces which have been employed ever since the crucible process was invented by Huntsman. There are a number of gas-fired crucible furnaces in Sheffield, but the newer method is in its infancy. Mr. Parkin said that gas-melting was cheaper than coke fuel, the operation was less arduous for the workmen, and the product—at any rate as regards composition—was superior to the material made with coke. Speaking from an experience of a considerable number of years with the Harvey-Siemens regenerative furnace, he stated that he had produced hundreds of tons of steel every year, which was sold in competition with coke-made steel, and the results had been highly satisfactory. The steel was better than the steel which was made by the older fuel.

New German Refractory Product

A new method of converting ordinary bricks into refractory firebrick has been perfected in Germany, consisting of a coating comprising a mixture of 75 per cent carborundum and 25 per cent sodium silicate. The mixture is applied to the bricks when they are thoroughly dried, and the coating sets and thoroughly dries in twenty-four hours, being slowly heated and burned in. This coating averages about one-fiftieth of an inch in thickness, and the adherent glassy veneer of carborundum gives remarkable resistance to any mechanical injury; it has the ability to withstand very high temperatures and affords complete protection against the chemical action of flames. It is said that sudden changes of temperature do not have any effect upon it. This coating has been used successfully as a lining for gas retorts as well as for the outside surface, and a paste of equal parts of carborundum and clay is used for repairs when cracks occur.

Suggestions for Calibrating Base Metal Thermocouples by the Freezing Point Method

BY KIRTLAND MARSH*

When calibrating thermocouples by the freezing point method, it is essential that the metals used be pure and maintained pure. Pure tin, zinc, aluminum and copper can be readily obtained from the Bureau of Standards for this purpose, but care must be exercised in using them to guard against contamination. This is realized by inclosing the thermocouple to be calibrated in a sheath to protect it from the molten metal. The sheath also prevents short-circuiting the couple at the surface of the metal. Hard glass tubes can be used for tin and zinc, but in aluminum these are unsatisfactory, and they cannot be used in copper. An iron tube can be used in any of these metals satisfactorily if steps are taken to prevent the contamination of the metal by the iron. This can be prevented in the following manner:

Prepare a mixture of one part by volume of graphite and two parts water; flake graphite will not mix readily with the water, but finely powdered graphite or ordinary plumbago, such as is used in foundries for facing, is satisfactory. Heat the sheath to about 900 deg. F., dip in the above mixture and withdraw quickly in order that there will be enough heat left in the sheath to dry the coating of graphite. The mixture should be thoroughly stirred before being used, because the graphite or plumbago will settle to the bottom of the container. A suitable container can be made of a piece of 4-in. iron pipe capped on one end and long enough to extend about 12 in. above the surface of the mixture to prevent spattering.

The sheath, after having been dipped and a smooth dry coating of graphite obtained, can be immersed in the molten metal without fear of contaminating it. After the sheath has been removed, any clinging metal and dross can be readily removed and the same sheath safely used in some other metal.

The only precaution necessary is to remove any loose oxide scale from the sheath before it is dipped and immersed in the metal; if this is not done, some of the scale may chip off and fall into the metal and thus render it impure and alter the freezing point.

When copper is used the furnace temperature is high enough to burn off the coating of graphite and in this case a second coating of lime can be used to protect the graphite. A suitable lime wash can be made of one part by volume of slaked lime and one part water. Heat the sheath to 900-1,000 deg. F., dip in the graphite wash, quickly remove and allow to dry thoroughly and then repeat in the lime wash. Both coatings will generally dry thoroughly without reheating.

Thermocouples of the pencil type, consisting of an insulated wire element welded at one end to a tubular element inclosing it, can be calibrated without a sheath if they are given a protective coating of graphite.

The chief advantages of these washes in calibrating thermocouples are as follows: metal sheaths which are much stronger and more rugged than refractory sheaths can be used; the molten metal is protected from contamination; one sheath can be used in all the metals because it can be thoroughly cleaned, and couples of the pencil type can be calibrated without any sheath, under which conditions the couple is much more sensitive to temperature changes and the calibration rendered more reliable, particularly when only a little metal is used.

*Aluminum Company of America, New Kensington, Pa.

Synopsis of Recent Chemical & Metallurgical Literature

Production of Hydrogen for the Manufacture of Synthetic Ammonia by the Hyperpressure Process.—In a note presented before the French Academy of Sciences, Feb. 21, 1921, Georges Claude stated that the commercial success of the hyperpressure process for the manufacture of synthetic ammonia depends on the economical production of hydrogen.* In another note of April 4, 1921 (*Comptes rendus*, April 18, 1921, pp. 974-977), he describes his experimental work for the production of practically pure hydrogen by separating it from its mixtures, such as water gas and coal gas. This separation is easily realized by the application of the principle of the insolubility of hydrogen and the solubility of the other gases of the mixture in ordinary ether.

The mixture, compressed to a given pressure, is passed through the solvent at a very low temperature when all the

SOLUBILITY OF HYDROGEN AND CARBON MONOXIDE IN ORDINARY ETHER

gases but hydrogen are dissolved in the ether. The solvent with the gases in solution is drained off, and when expanding to atmospheric pressures the dissolved gases escape, leaving the solvent ready for re-use.

The difficulty encountered in the use of this process is that the hydrogen obtained is somewhat contaminated with carbon monoxide; but a series of tests has led to the practical means of how to reduce the CO content to a minimum. This is best shown in the accompanying figure giving the solubilities of hydrogen and the carbon monoxide in ordinary ether at +20 and -40 deg. C. for pressures up to 1,600 atmospheres. By working at a low temperature, -40 deg. C., and at a pressure of about 100 atmospheres it is possible to obtain hydrogen containing less than 0.002 part CO.

Predicting Strength of Rolled Steel.—William R. Webster is to read a paper before the Wilkes-Barré meeting of the American Institute of Mining and Metallurgical Engineers, reopening a subject which was much discussed during the early '90s. Since then Campbell,¹ Cunningham,² Stead³ and McWilliam⁴ have proposed formulas for the relation between chemical composition and strength. It was early recognized that differences in amount of reduction during rolling would account for 6,000 to 10,000 lb. per sq.in. tensile strength.

*See CHEM. & MET. ENG., April 20, 1921, p. 706.

¹"Manufacture and Properties of Iron and Steel."

²Trans., Am. Soc. Civil Eng., vol. 38, p. 78 (1897).

³J. Iron and Steel Inst., vol. 44, p. 5 (1916).

⁴J. Iron and Steel Inst., 1918, II, McWilliam's formula for ultimate strength normalized 1 in. bars of basic open-hearth steel is $38,000 + [800 + 4(C - 20)]C + 120Si + [100 + 2(C - 20)]Mn + 1,000P$.

Finishing temperature also had an important influence; in fact, several steel works have found it useful to construct tables of their own to include the effects of all the conditions existing at that particular place. One such table for basic open-hearth steel is quoted, and Mr. Webster finds that by starting with 50,145 lb. per sq.in. for a 0.10 per cent C, 0.34 per cent Mn steel, the results would be closely approximated by giving an increase of 830 lb. for each point carbon and 170 lb. for each point manganese. "When phosphorus is greater than 0.02 the figures should be increased at the rate of 1,000 lb. for each 0.02 per cent that the phosphorus exceeds 0.01 per cent."

Recent Chemical & Metallurgical Patents

British Patents

For complete specifications of any British patent apply to the Superintendent British Patent Office, Southampton Buildings, Chancery Lane, London, England.

Refining Platinum.—In the separation of platinum from other metals, there is obtained a solution containing gold and palladium, which are then precipitated, leaving a pure platinum solution from which the metal is electrodeposited. The precipitation of gold and palladium may be effected by means of hydrogen previously treated with ultra-violet light, for instance by passing the gas through a helical silica tube surrounding a silica mercury-vapor lamp. If a plate of gold or palladium is placed in the solution, a voltaic couple is stated to be formed with the hydrogen. In obtaining the solution of platinum, gold and palladium there may be employed broken ingots of impure platinum or sludges resulting from electrolytic treatment of impure gold anodes in nitric acid solution, the silver being deposited on the cathode and platinum, iridium, palladium, gold and lead precipitated. The impure metal or sludge may be treated with diluted aqua regia at 70 deg. C. in a closed vessel A provided with a stirrer b. Only the platinum, palladium and gold dissolve. An alternative method of obtaining such a solution consists in treating an impure gold anode in acid auric chloride solution or aqua regia, silver, iridium, rhodium, ruthenium, etc., remaining undissolved. A part of the gold may then be deposited electrolytically, say in the same cell, but the solution must be removed from the cell when it contains 3 per cent of gold, 6 per cent of platinum and 0.5 per cent of palladium. Treatment with the hydrogen is effected in a closed vessel B, excess of gas escaping by a pipe f, and the solution being removed by a pipe g extending downward through one-third of the height of the vessel. The electrolytic vat C for the deposition of platinum is provided with a tight cover and with electrodes k, i of pure retort carbon. A current density of 4.8-9 amperes per sq.dm. is suitable. Removal of the spongy platinum may be facilitated by slightly paraffining the cathode. If the anode is exposed to ultra-violet light, the chlorine is enabled to act on water, regenerating hydrochloric acid and producing oxygen, which either acts on nitrogen oxides present in the electrolyte to regenerate most of the nitric acid for re-use, or escapes with the hydrochloric acid to the first electrolytic cell where it assists dissolution of the gold anode. The source of ultra-violet light may be a silica mercury-vapor lamp l, placed either between the electrodes and near the anode, or outside a window in the wall of the cell. (Br. Pat. 157,785; not yet accepted; F. SLATINEANU, Cressy-Onex, near Geneva. April 6, 1921.)

Evaporating Liquids.—In an evaporating apparatus in which liquid is heated by circulation through a tubular heating apparatus A and is evaporated in a separate chamber C from which the unevaporated liquid is returned to

the heater, the formation of vapor in the heater is prevented by increasing the pressure therein by providing a restricted outlet d between the heater A and the vessel C and by inserting a pump B in the pipe which returns the liquid to the heater. The pressure is regulated by a valve P. A float regulator M serves to regulate the feed of liquid to the evaporator. To increase the transmission of heat in the heater A, the speed of flow of the liquid in the tubes is increased by the pump B, the tubes are placed closer together, and the steam

is circulated repeatedly over the tubes. In evaporating salt solution, the conical base of the chamber C is connected to a vessel adapted to receive the deposited crystals and to discharge them by admission of compressed air. In evaporating liquids such as milk, fruit juice, gelatine solution, etc., the heater A is heated by circulation of hot water which is heated in a second tubular heat-exchanger heated by steam. (Br. Pat. 158,569; BARBET ET FILS ET CIE., Paris. April 20, 1921.)

Sterilizing Liquids.—In sterilizing water or other liquid by addition of chlorine or other gas, water and chlorine are passed in regulated streams to an absorber b, and the chlorinated water which collects in a vessel h is supplied

to the main flow of water in proportionate quantities. Chlorine is passed from a reservoir a through a filter d, a reducing valve e, a metering device o and a regulating valve x to the absorber b, and water is passed from a tank f through a valve g. The chlorinated water passes from the vessel h to a vessel c through a float valve and is fed through a tapered valve i controlled by a float k immersed in the main flow of water passing over a weir. The flow of chlorine and water to the absorber may be regulated by diaphragm valves m, n operated by a float l in the vessel h. The metering device o may be arranged to record the amount of chlorine that passes through it. (Br. Pat. 158,578; W. PATERSON, London. April 20, 1921.)

Current Events

in the Chemical and Metallurgical Industries

American Engineering Council Receives Report on Waste Elimination

At the regular bimonthly meeting of the executive committee of American Engineering Council in St. Louis on June 3, the Committee on Elimination of Waste in Industry made a report of the investigations which it has been conducting for the past six months. The outstanding feature of the report was the responsibility placed upon management for 50 per cent of the wastes of industry, while less than 25 per cent was laid at the door of labor. The investigation revealed a margin of unemployment of more than a million men, idle equipment valued at billions of dollars, and a waste of time, energy and money in other ways amounting to millions annually.

The full report of the committee, which was not adopted by Council, but which is to be published under its authority as a committee report and signed by the committee, comprises 125,000 words and deals with the deep-seated causes of waste apart from the world-wide waste and extravagance caused by the war. It discloses loss and waste from interruption of production, low production, restriction of production, and lost production.

Wastes attributable to faulty management are characterized as follows:

"The average method of management is far behind standards which have demonstrated their practical value; billions of dollars are tied up in idle equipment, and there is a large additional waste through maintenance and depreciation charges; manipulations in raw material result in serious losses; an evil in some instances is the practice of cancellations and returns; high labor turnover is a rough index of one of the commonest wastes in industry; the waste of time and energy and money through duplication of estimates and bids in the building trade runs into millions every year; quantity figuring by all bidders is a duplication of effort and a source of waste in construction work."

Both employer and employee are charged with restricting production, the former by limiting the total output of an industry and the latter by limiting the rate of production of the individual. Preventable diseases and industrial accidents account for an economic loss of over three billion dollars per annum.

In order to eliminate much of the waste the committee recommends a program of governmental assistance involving the establishment of a national industrial information service, a national statistical service, a national health policy, a nation-wide program of industrial standardization and a revision of such federal laws as interfere with stabilization of industry through trade associations and similar organizations.

Numerous other committees made reports at this meeting of Council, but no important action was taken. The next meeting probably will be held in September, at which time it is likely that a president will be elected to succeed Mr. Hoover. The Council voted to send out nomination blanks.

Three new organizations were elected to membership in the Federated American Engineering Societies. These are: Jamestown Engineering Society, Vermont Society of Engineers and Technology Club of Syracuse.

Exercises at Edgewood Arsenal

Special exercises were held at Edgewood Arsenal on June 4 in commemoration of the anniversary of the establishment of the Chemical Warfare Service as an integral subdivision of the Army. In addition to addresses in which the accomplishments of the year were reviewed, there was a minstrel show, moving pictures and a dance.

A. C. Fieldner Becomes Superintendent of Pittsburgh Station, Bureau of Mines

The important post of superintendent of the Pittsburgh station of the Bureau of Mines has been filled by the appointment of Arno C. Fieldner. Mr. Fieldner has been the acting superintendent of the station since June, 1920. An administrative assistant will be employed, so that Mr. Fieldner may carry on the greater part of his research work. He will continue to discharge the duties of supervising chemist. As superintendent, Mr. Fieldner will receive a salary of \$5,000.

While Mr. Fieldner has demonstrated that he has unusual executive ability, he has been disinclined to accept an administrative position. Former Director Cottrell, of the Bureau of Mines, and Director Bain each has been anxious that Mr. Fieldner continue uninterruptedly on his research work. A determined effort has been made to secure a properly qualified person, other than Mr. Fieldner, for the position. The difficulty is, however, that such engineers are unwilling, or are not in a position, to make the financial sacrifice necessary with the Government's scale of salaries.

Experimental work calling for nearly \$400,000 a year is being conducted at the Pittsburgh station.

Mr. Fieldner formerly was a member of the U. S. Geological Survey. He went with the Bureau of Mines at the time its work was separated from that of the Geological Survey. During the war he was transferred to the Chemical Warfare Service, where he attained the rank of major. On June 13, 1919, he was re-transferred to the bureau and was made supervising chemist at Pittsburgh. Since the promotion of E. A. Holbrook to be assistant director of the bureau Mr. Fieldner has acted as superintendent.

Patent Amendment Proposed

In the interest of the national defense and to prevent unwarranted advantages to foreign inventors, Senator Stanley of Kentucky has proposed an amendment to the Revised Statutes providing that any patents issued to foreigners must be put in operation and production in reasonable quantities begun within the continental limits of the United States within two years. Failure to comply with that provision entitles the United States to issue a license which will permit use of the patent.

The legislation, Senator Stanley states, is intended to prevent such a situation as arose at the outbreak of the war when the United States was cut off from supplies of dyes which were made only in Germany. German interests had American patents covering more than 1,000 coal-tar products. Had these interests been required to manufacture their products in the United States American industries depending on them would not have been paralyzed. Senator Stanley points out that practically every other nation has a law requiring compulsory production, within the country, of patented articles taken out by foreigners.

American Ceramic Society Announces Summer Meeting

The American Ceramic Society's summer meeting will be held at Canton, Alliance, Sebring and East Liverpool, Ohio, July 25 to 27 inclusive, with headquarters at the Hotel Courtland, Canton, Ohio.

Among the plants visited in Canton will be the Deuber Watch Case Co. On the evening of July 25 a banquet will be held at the Canton Country Club. On Tuesday the members will visit ceramic plants in Alliance, closing the day with a dinner party and smoker at Myers Lake. Wednesday, the 27th, will be devoted to visiting plants in the East Liverpool district.

Research Council Chemical Division Officers Elected

Dr. F. G. Cottrell has been re-elected chairman of the Division of Chemistry and Chemical Technology of the National Research Council for the year beginning July 1. Julius Stieglitz was elected vice-chairman. The executive committee, in addition to Drs. Cottrell and Stieglitz, will be composed of W. D. Bancroft, R. B. Moore, W. F. Hillebrand and C. G. Fink.

Members at large of the Division of Chemistry and Chemical Technology, elected for three years, are Treat B. Johnson, New Haven, Conn., and R. B. Moore, Washington, D. C.

Representatives of constituent societies have been selected as follows:

American Chemical Society—C. E. Franklin, Stanford University, California; John Johnston, Yale University, New Haven, and J. E. Teeple, New York City.

American Ceramic Society—Albert V. Bleininger, Bureau of Standards, Washington.

Dr. Cottrell Goes to Europe

Dr. F. G. Cottrell, chairman of the division of chemistry and chemical technology of the National Research Council, sailed June 11 for Europe to make a survey of the applications being made of helium in European countries. He also will make a special study of oxygen separation and concentration. In this work he is representing the U. S. Bureau of Mines as well as the Research Council.

While in Europe Dr. Cottrell will attend the meeting of the International Union of Pure and Applied Chemistry, which is to be held in Brussels June 27. Other delegates selected by the National Research Council to attend the Brussels meeting are E. S. Chapin, Frederick G. Keyes, Collin McCall, H. S. Taylor and James B. Conant.

Chicago Meeting of the Refrigerating Engineers

The American Society of Refrigerating Engineers held its eighth Western meeting at the Hotel Drake, Chicago, May 25 to 27.

BUSINESS SESSION

One of the most important items that this association has under advisement is the preparation of a mechanical refrigeration code, a committee of the society working in co-operation with the American Engineering Standards Committee. A tentative code was presented to all the members present and considerable discussion followed, several exceptions being taken particularly to the pressures listed for ethyl chloride, sulphur dioxide and methyl chloride, which were said to be too high compared with the corresponding pressures given for ammonia. Other members took exception to the fixed specifications on electrical equipment as regards its being isolated from the refrigerating equipment in the power house. It was further agreed that the lower limit of three tons as the size of plant requiring a licensed engineer was an unreasonably low figure, which should be raised to twenty or thirty tons.

In the discussion on the Bureau of Standards work with anhydrous ammonia it was decided that the two fellowships which are maintained by the society at the expense of about \$6,000 per year should be continued for the coming year. By 1923 the work on the anhydrous ammonia tables will be completed and some work started on CO₂. Furthermore, it is expected that the Government will appropriate enough money to continue this work indefinitely for the benefit of the industry.

MULTIPLE EFFECT COMPRESSION

H. C. White of the Consumers Co., Chicago, delivered a paper on "Multiple Effect Compression," where a method is employed consisting of first filling the compressor cylinder with low-pressure gas and then near the end of the stroke switching over the valves and admitting gas at higher pressure to compress the charge and fill the cylinder with the denser gas. Machines of the Consumers Co. have been equipped with these Voorhees devices, resulting in considerable gain in economy.

Data were given on a single-acting compressor with a condenser pressure of 185 lb. and a suction pressure of first 20-lb. gage and then 35-lb. gage. In the first case it was necessary to compress 4.17 cu.ft. of gas per ton of refrigeration with a compression horsepower of 1.336, while in the second case 2.84 cu.ft. was compressed with a horsepower 0.98, showing that 47.5 per cent more capacity was obtained and 26.5 per cent less power was used per ton of refrigeration. For each pound increase in suction pressure the saving was placed at 1.76 per cent.

BRINE SPRAY REFRIGERATION

S. C. Bloom, in discussing "Brine Spray Refrigeration," compared a new type of nozzle which gave a hollow cone-shaped spray with the earlier inefficient devices giving a coarse flat spray. One of the earlier methods was to use a plugged nipple discharging against a plate, or an adjustable nozzle which the operator could change at will. Pressure ranged from 20 to 70 lb., although 25 lb. would have been sufficient in most cases. Spaces between nozzles in the older types varied from 12 to 48 in. according to the notion of the designer and mains were further connected in parallel so that reduction of pressure on one would affect all. Brine temperatures employed ranged from 8 to 20 deg. F. and the height from deck to ceiling averaged from 6 to 8 ft. It was further commonly thought that the stronger the brine solution the better would be the results.

Improvements in the deck system of spraying had been sought by the author and applied quite extensively in the Chicago plants of Armour & Co. A weak brine solution was used and the problem of obtaining better circulation and more rapid cooling was undertaken. The nozzles formed a spray of a hollow cone shape and were so spaced that the cones of spray intermixed and filled the entire space of the cooler loft. Experiments showed the most suitable pressure was 7½ lb. Gravity tanks were arranged above the nozzles to prevent variation in pressure and this, coupled with non-adjustable nozzles, made a system practically fool-proof. Experiments showed that the latter type of system was much more desirable. In modern installations more brine surface is presented to the air and more rapid circulation obtained through the brine and proper spacing of nozzles, all of which makes better concentration of ammonia at the power house.

SPRAY COOLING SYSTEMS

O. J. West read a paper on "Spray Cooling Systems," which brought out the great increase in cooling capacity obtained by the use of sprays as compared with a basin or pond without sprays. The proper use of piping arrangement was suggested, operating pressures were given and nozzles described. The spray system is coming into greater use, there now being over 2,000 installations in the United States.

FUNDAMENTAL CONSTANTS

E. F. Mueller, of the U. S. Bureau of Standards, presented a report on the progress in the determination of the fundamental constants of refrigeration engineering, including a set of standard anhydrous ammonia tables. These tables may be obtained by addressing the Bureau of Standards at Washington, D. C., or securing a copy of the January issue of the *Journal of the American Society of Refrigeration Engineers* published at 154 Nassau St., New York.

REFRIGERATION IN RUBBER MANUFACTURE

"Refrigeration in the Manufacture of Rubber" was given by J. H. Vance. Since the raw rubber arrives at the factory full of dirt, bark and wood chips, it is first necessary to wash it. This process is carried on by passing the material through cast-iron rolls made with chilled surfaces and so corrugated that a crushing and shearing action takes place as the rubber passes through. From these rolls it enters the washers and sheeters, whence it emerges in the form of a thin irregular sheet. The wash water at this point must be below 76 deg. F. to prevent tackiness, and often refrigerated water must be used to maintain this temperature.

After the rubber is thoroughly washed it is passed into drying rooms or vacuum driers and passes through hollow

rolls, where it is masticated. These rolls operate in pairs with a speed ratio of $1\frac{1}{2}$ to 1 revolution. From the drying room the material is passed to the mixing mill, which consists of sets of rolls for working the rubber. Each set consists of two hollow cast-iron cylinders with smooth surfaces operating at a speed of 1 to $1\frac{1}{2}$ revolution ratio. This operation causes a grinding of the rubber at the same time the additional compounds are being mixed in. The friction at this point generates so much heat that it is absolutely essential to use refrigerated water to keep these rolls at the proper temperatures. In a typical plant where 5,000 gal. of water per minute was used, figures were taken to determine the exact amount of refrigeration required.

The mixing heat on rolls varies widely but must be kept below 176 deg. F. to prevent scorching of the rubber. In this particular plant in question the water temperature on entering the inside of the hollow roll was 58 deg. F. and the return water was 64 deg. F. In making the calculations for refrigeration count was taken of the friction load, driving load, thickness of metal and other factors. It developed that 788 hp. was consumed in the operation, producing enough heat to require 167 tons of refrigeration. In carrying the figures down it developed that one-sixth of a ton of refrigeration was required per lineal inch of roll face to maintain the necessary temperature.

Other papers presented were "Automatic Appliances for Refrigerating Machines," "Modern Air Compressor Practice and Testing," "Water Treatment for Raw Ice" and "Egg Shell Sterilization for Cold Storage." The convention closed with an informal dinner at the Hotel Drake and various plant trips in the vicinity of Chicago.

Program Arranged for New Jersey Clay Workers Meeting

In connection with the program for the summer meeting of the New Jersey Clay Workers Association and Eastern Section of the American Ceramic Society, to be held at Trenton, N. J., on June 17, Prof. George H. Brown, director of the Department of Ceramics, Rutgers College, New Brunswick, and secretary of the association, has arranged for a number of interesting papers and addresses. Among these will be a technical paper on the subject of "Hollow Building Tile," by Walter A. Hull, United States Bureau of Standards, Washington, D. C., and a lecture by Prof. A. S. Watts, Ohio State University, Columbus, on "Factory Preparation and Burning of Whiteware Bodies." An address will be made by William Burgess of the United States Potters' Association. At both morning and afternoon sessions there will be a discussion of practical problems pertaining to the ceramic industry, such as kilns, kiln firing, saggers, etc. It is proposed to arrange a trip to a number of representative local potteries.

American Farm Bureau Federation Report on Muscle Shoals

The executive committee of the American Farm Bureau Federation has approved unanimously the report prepared by the special committee appointed to investigate the entire Muscle Shoals project. After thorough study the committee recommends that the Wilson Dam be completed by the Government without further delay and that the nitrate plants be placed under the direction of a Government owned corporation which may, at its discretion, operate the plants or maintain them ready for operation, but with strict regulations as to prices to be obtained for commodities in which the products of these plants are used.

Will Discuss Plastering Code

Chapter 3 of the proposed national plastering code will be discussed at a conference at the Bureau of Standards June 20. This chapter is devoted to plaster materials. Chapter 1 of the proposed code has been completed. It deals with masonry backing for plaster. Chapter 2 deals with lath backing and is nearly completed. Chapter 4, dealing with mixing and application of plaster, was recently started. Chapters to be written later include "Properties of Finished Materials," "Methods of Testing Finished Plaster" and "Patching and Decorating."

Chicago Section of American Ceramic Society Holds Spring Meeting

Members of the Chicago Section, American Ceramic Society, met at an informal dinner on May 23 for the spring business session and presentation of informal papers.

REFLECTOR ENAMELS

Cullen W. Parmelee abstracted a paper on the development of a reflector enamel, being the thesis of William R. Morgan and A. H. Charles of the University of Illinois. Tests were run to determine the combined effect of cobalt and nickel in ground coat for sheet steel enamel. Comparisons were made of color and texture and impact tests were carried out on the pieces. It was found that 900 deg. C. was the most favorable temperature to which the enamel should be heated. The toughness of the enamel decreased as the temperature was increased above this point. The best mixture of the two oxides was determined as 1 per cent nickel oxide and 1 per cent cobalt oxide. It was concluded that the presence of nickel is conducive to uniform color and that the amount of cobalt oxide necessary is in excess of that used in general practice. An increase in the percentage of total color oxide content decreases pinholing at the proper maturing temperature. Cobalt oxide is valuable as an indicator of maturity.

Further experiments were made with chromium oxide, spinel and tin oxide in enamel. The tests showed that tin oxide has the highest reflecting power, spinel the next highest and zirconia the least amount. The practical limit for the quantity of tin oxide added is 10 per cent. Spinel is interesting as a substitute for tin oxide using about 8 per cent. It is, however, about 10 per cent less efficient than tin oxide.

PYROMETRY

G. V. Nightingale and F. C. Baker conducted an instructive discussion on pyrometry, with particular reference to the types used in industrial practice. The recording pyrometer is an accurate check on the clay burner. The potentiometer is the most accurate type of instrument used but it is difficult to get the operators to give it the proper care.

BUSINESS MEETING

A motion was carried after considerable discussion to have a committee appointed for meeting with a similar committee from the Illinois Clay Manufacturers Association, such joint committee to consider the amalgamation of the Chicago Section of the American Ceramic Society with the Illinois Clay Workers Association.

Motion was carried to place the power in the hands of the executive committee of the local section to appoint four members for service on the advisory board of the University of Illinois.

Chester H. Jones was nominated to serve on the committee of the national society for selecting American Ceramic Society national officers for the coming year.

Research Work on Electrodeposition

During the past month a member of the Bureau of Standards staff attended meetings of the American Electrochemical Society in the interests of research work on electrodeposition. A great deal of interest was shown in the proposed program and plans were made for the formation of a division of the society to be concerned wholly with this kind of work. If such a division is organized, it will be a distinct advantage in bringing together persons interested in this field and thereby stimulating research work along electrochemical lines.

Letters have been sent out by the National Research Council to about 200 representative manufacturers in whose plants electroplating is an essential process. The purpose of these letters is to inquire whether they would be willing to furnish financial support toward research work on electrodeposition. If such support is received, it is expected that the funds will be expended for research work conducted at the Bureau of Standards under the general supervision of a representative advisory board.

Industrial Alcohol Makers Not Satisfied

Manufacturers of industrial alcohol are far from satisfied with Representative Volstead's bill, supplementing the national prohibition act. In its final form, as reported favorably to the House of Representatives, language was added specifically stating that nothing in the bill is to authorize the prohibition commissioner to limit the quantity of alcohol that may be manufactured.

The parts of the bill to which most objection is taken are sections 3 and 4. As presented to the House, these sections read as follows:

SEC. 3. The commissioner shall only grant the permits that are necessary to supply the actual needs for non-beverage purposes and shall limit the supply and use of all liquor save denatured alcohol and denatured rum unfit for internal use to such non-beverage needs. *But this provision shall not authorize the commissioner to limit the quantity of alcohol that may be manufactured, nor shall it be taken to repeal the right of the applicant for a review of the decision of the commissioner in refusing a permit by a court of equity as provided in the national prohibition act.* If the commissioner shall find that any article enumerated in subdivisions b, c, d, or e of section 4 of title 2 of the national prohibition act is being purchased for use as a beverage, or for intoxicating beverage purposes, he may require a change of formula of such article or cancel the permit for the manufacture of such article unless it is made clearly to appear to the commissioner that such use can only occur in rare or exceptional instances.

No intoxicating liquor other than alcohol shall be used in the manufacture of any article enumerated in subdivisions b, c, d, and e of section 4, title 2 of the national prohibition act unless it shall clearly appear to the satisfaction of the commissioner that the use of intoxicating liquor other than alcohol is essential as a component part of such article.

SEC. 4. Not less than twenty days before an annual permit is issued for the sale of any liquor or the manufacture of any liquor or any article enumerated in subdivisions b, c, d, and e of section 4, title 2, of the national prohibition act, the application therefor shall be filed with the commissioner and made a public record, and notice thereof shall be served by registered mail on the Attorney General and the commissioner may require such notice to be publicly posted at the applicant's place of business as regulations may prescribe. Any federal or state officer or any person authorized thereto by any such officer may oppose any such application.

Despite the objections raised to dual control by the prohibition commissioner and the Attorney General, no change was made in that part of the original bill. The committee did accede to the objections voiced against the requirement that a part of the component materials must be added to alcohol at the distilleries. Users of industrial alcohol also objected to the requirement that the permit be publicly posted at the applicant's place of business. It was argued that this requirement places the industrial users of alcohol on much the same footing as saloons formerly were.

Secretary Hoover on Trade Associations

The attitude of the federal administration toward the trade organizations of the various industries has been made clear by recent announcements by the Secretary of Commerce and by the Attorney General. The Attorney General has given notice that he will push a test case against one of the open-price associations. There will be no dragnet thrown over all the associations and there will be no wholesale indictments, Attorney General Daugherty declared. Secretary Hoover authorized the following statement:

The relation of trade associations and trade institutes to the anti-trust laws have been discussed at great length in the Administration. Of the many thousands of such organizations there are a small minority who have degenerated into ways that make for restraint of trade.

All are agreed that the purposes and actions of the vast majority of national associations are a constructive contribution of public welfare. Their activity in promotion of better business practices, advancement of technical processes, simplification of produc-

tion standardization of quality, extension of foreign trade, commercial arbitration, etc., makes for more efficient industry and business. Many of them collect information as to the production, stocks of raw and other material, percentage of industry in active operation, and total orders in hand, all of which when available to the public contribute both to stability and the increasing efficiency of industry and to the protection both of the smaller manufacturer and the consumer. The Department of Commerce wishes to co-operate and assist with all of this sort of effort.

A smaller number of such associations have been engaged in the collection of data on the prices for the exclusive use of their members. Some of these associations have been charged with delimiting areas of commodity distribution among their members and other misuse of information. Whether these latter practices constitute a violation of the national anti-trust laws must be determined by the courts, and this the Attorney General is vigorously proceeding to find out.

All this raises anew the question of the authority of the Federal Trade Commission. The original conception of the commission was that it should, among other things, advise business men as to what constituted a violation of the restraint of trade laws, but these powers were struck out in the course of original legislation. It seems to me that the seven years' experience with the commission should now enable a reconsideration of its powers with a view to giving it a more constructive function, subject say to review by the Attorney General, by which it could remove the uncertainties from the mind of business men as to the line between the field of co-operation for promotion of production and trade in public interest and the field of practices against public interest. There is nothing so destructive of business as uncertainty, and business has inherently enough uncertainty to deal with, without this one.

Hercules Powder Co. Acquires Aetna Explosives Co., Inc.

Rumors of the proposed purchase of the Aetna Explosives Co., Inc., by the Hercules Powder Co. received definite confirmation last week, when the Aetna stockholders sanctioned the sale of its properties, assets and business. This marks the culmination of a transaction that has interested financial and business circles for the past two years, and which in addition to being a deal of considerable moment also presents an unusual legal aspect.

Although it has been understood practically since the close of the war that negotiations were under way between these two manufacturers, it was not until the petition of the Hercules company for permission to purchase the Aetna company had been acted on favorably by the Circuit Court of Appeals, sitting as the United States Court for the District of Delaware, that the proposition assumed any real definiteness. The Hercules company was originally created by a decree of a federal court in an action brought by the United States against the du Pont company under the Sherman act. Although not a party to this action, the Hercules company is bound by certain injunctions in the final decree, and for this reason it was deemed necessary to petition the court for permission to effect the present transaction. On May 4, a decision was rendered on the Hercules company's petition, sanctioning the purchase of the Aetna company, in which the court expressed itself as convinced that in permitting the Hercules Powder Co. to buy the Aetna company actual competition would be undiminished and even probably increased, especially as regards the Hercules company's strongest rival, the du Pont company.

By this purchase the Hercules company will acquire high explosives, or dynamite, plants near Birmingham, Ala.; Emporium, Pa.; Sinnamahoning, Pa.; Ishpeming, Mich.; and Fayville, Ill.; two black blasting powder plants, one at Goes Station, Ohio, and the other near Birmingham, Ala.; a plant for the manufacture of blasting caps and electric blasting caps at Port Ewen, N. Y., and a plant for the manufacture of fulminate of mercury, for use in blasting caps, at Prescott, Ont., Canada.

The company states that reorganization and new alignments of branch office territories will take place gradually.

Water Purification

The last meeting on the 1920-21 program of the Connecticut Valley Section of the A.C.S. was held in Westfield, Mass., on May 22. The members were entertained for dinner at the Mt. Tekoa Country Club. The afternoon was given up to a trip to the Borden Brook reservoir and filter plant, which forms a part of the water supply of Springfield, Mass. About thirty members made up the party for the trip and thanks to the courtesy of the members of the staff at the filter plant enjoyed a most instructive excursion.

Prof. Whipple, of the Harvard Engineering School, was the speaker at the evening meeting. His subject was "Water Purification."

Dr. Whipple showed a series of charts illustrating the various qualities of the waters of Massachusetts used for town and city water supplies. These charts showed color, sediment—the sediment in these waters is so slight that it cannot be expressed in terms of the silica standard—iron, hardness, chlorine and other factors. For the most part the waters of Massachusetts are low in color and in carbon dioxide and are in general very soft waters. Some, however, are quite corrosive.

Some recent European work, he said, has shown a balance between carbon dioxide, carbonate and bicarbonate. If there is more carbon dioxide in the water than this relation calls for, the waters are corrosive. For this reason apparently the most corrosive waters of the state are soft waters.

Filtration of waters to be successful must do much besides cleaning up water from a sanitary standpoint. Some methods now used increase corrosion by increasing the carbon dioxide and reducing the bicarbonates in water. For this reason alum is not entirely satisfactory as a coagulant. He said that we formerly considered that the action of alum in water was simple. It is now known to be very complex. Conductivity methods have shown this especially well. He referred to the article by Abel Wolman and Frank Hannan, published in *CHEMICAL & METALLURGICAL ENGINEERING*, vol. 24, pp. 728-34, as illustrating this point and invited contributions along such lines as this from all chemists who might find opportunity to do work in this field.

Study of the reactions involved in various methods for water-treating which would show the time necessary for the reaction to be completed is very necessary, he said, for if the time between treatment and filtering is too short the reaction will go to completion afterwards and will probably cause trouble. He read a letter from Allan Hazen bearing on this point specifically. Mr. Hazen believes that the time factor in settling of waters has been underestimated and that more attention must be paid to it. Some waters contain compounds which retard the formation of the alumina flock.

With regard to industrial water purification Dr. Whipple said that he believed that there was a relation between color and dissolved alumina. Sometimes waters are found that will not respond to a softening treatment until they are heated. Soft waters are the most troublesome in this respect. He thought that new methods might be worked out to largely replace those now in use.

The corrosive problem has not yet been properly handled. He quoted Prof. Phillips of Harvard, who believes that the presence of electric currents generated by couples formed at the junction of dissimilar elements may be a source of some of the trouble. Another factor of importance in water-treatment, especially where mechanical filters are used, is the handling of the alumina flock and its removal by the filter bed. Pipes of the largest diameter possible should be used to pass the water to the filters so as to have the stream flow as slowly as possible in order that the alumina flock may not be broken up.

To Extend Aid to Export Industries

Details of the plan of the Secretary of Commerce to aid the export industries now are being worked out. Each of the industries is to be separated into subdivisions. Three of the chemical subdivisions have been agreed upon and others are to be chosen later. The three subdivisions which have been decided upon at the time of this writing are dyes, drugs and phosphates.

Personal

E. D. FROHMAN, of the S. Obermayer Co., Pittsburgh, Pa., has gone to Europe, where he will make a special study of the application of high-temperature cements for boiler and metallurgical furnace linings.

ELLWOOD HENDRICK, consulting editor of *CHEMICAL & METALLURGICAL ENGINEERING*, received the honorary degree of Doctor of Science from Franklin and Marshall College of Lancaster, Pa., on Commencement Day, June 8.

SIDNEY D. KIRKPATRICK has joined the editorial staff of *CHEMICAL & METALLURGICAL ENGINEERING*, with headquarters in New York. He was until recently a chemical expert for the U. S. Tariff Commission, Washington, D. C.

HARAI R. LAYNG, of the Eureka Holly Mining Co., has resigned and is now practicing as a metallurgical engineer in San Francisco. He was superintendent of both the Holly and Bullwhacker mines, and later designed and constructed a 15-ton experimental chloridizing volatilization plant, completed last March.

C. E. MCQUIGG is continuing research work for the Union Carbide & Carbon Corporation at the new Long Island City laboratory, instead of at Niagara Falls, N. Y.

Dr. ERNEST FOX NICHOLS was inaugurated as president of the Massachusetts Institute of Technology, Cambridge, Mass., on June 8.

F. H. PENDLETON, formerly chemist with the New England Bureau of Tests of Boston and more recently research chemist with the Gorton-Pew Fisheries Co., Gloucester, Mass., has joined the staff of Skinner, Sherman & Esselen, Inc., Boston, Mass.

WALLACE SAVAGE has resigned as assistant editor of *CHEMICAL & METALLURGICAL ENGINEERING* to take effect June 30. He will devote his attention to the commercial development of an asphalt expansion joint designed by him for use in concrete construction.

WILFRED W. SCOTT has resigned as research chemist of the General Chemical Co. and has accepted the position of associate professor of chemistry in the Colorado School of Mines, Golden, Col.

T. F. SULLIVAN, who has been in charge of construction for the new paper mill of the Riordon Co., Ltd., at Temiskaming, Que., has accepted a position as sales engineer with the Springfield Boiler Co., Springfield, Ill.

Obituary

W. B. COGSWELL, founder of the Solvay Process Co., died recently at his home in New York of blood poisoning resulting from an infected middle ear.

JOHN W. LEITCH died at Minesbridge, England, on May 20. Mr. Leitch was the pioneer British manufacturer of TNT and during the early days of the war was called upon to supply this explosive, which was so badly needed that it was used at the front within forty-eight hours after being manufactured. His plant and services were put at the disposal of the War Office and formed the nucleus of the great government TNT works. The heavy work of the early years of the war so told upon his health that toward the end of 1916 he had a breakdown following an attack of influenza which left his heart seriously affected. He recovered sufficiently, however, to resume his activities and in 1919 was appointed chairman of the mission sent to study some of the dye works in the occupied area of the Rhine. The two-volume report of this investigation is an eloquent testimony of the work done by this mission.

Current Market Reports

The Chemical and Allied Industrial Markets

NEW YORK, June 13, 1921.

The heavy chemical market continues to show improvement, and activity is emphasized in several important items. It is sufficiently apparent that liquidation has brought about an actual shortage of goods in some instances and buyers have forced prices upward in their efforts to cover requirements. While this condition does not hold true throughout the entire list and while it is evident that manufacturers will readjust prices in some commodities, the fact that caustic soda, soda ash, oxalic acid, nitrite of soda and other important items have resisted any selling influence is quite significant that the bottom has practically been reached. If the strength shown in these commodities during the past week is to be permanent, then a decided improvement can be expected throughout the general list.

One of the most encouraging features was the intermingling of foreign inquiries with those for domestic requirements. It is reported that several inquiries were received from Italy, Mexico and the Far East. Europe is reported to have been in the market for numerous large quantities of caustic soda and in some instances these inquiries have turned into actual orders.

Importations have already been decreased since the new tariff legislation, which dampened the buying of foreign goods and shifted the inquiry to domestic materials. This has been particularly true in the case of oxalic acid. The heavy imports of oxalic, which have been flooding the country during the past six months, have been summarily stopped by a ruling from the Treasury Department classifying this article as a "synthetic organic chemical" and subject to the same license rulings as dyestuffs and intermediates under the emergency tariff measure. Quite a few importers, unaware that there would be any such decision, have been caught with goods afloat or ready to be shipped. The situation has thrown the market into confusion and holders of stocks in this country have forced their prices up as far as possible. Soda ash was among the commodities to report a net advance in the spot market at the close. Rumors were current throughout the week that buyers are greatly concerned over shipments of ash from England and many interests expected delays in view of the coal strike. The result was that domestic ash was taken and the buying movement was sufficiently heavy to reduce resale stocks and register a high market.

There was a noted improvement in the inquiry for caustic soda. It is stated that English caustic soda cannot be imported into this country below 5c. per lb. Small lots of bichromate of soda have attracted a great deal of attention from the consuming trade and the market recorded an advance for the week.

CHEMICALS

Small lot buying orders of *bichromate of soda* reached the open market in good volume during the past week and dealers have been able to advance quotations without much difficulty. It is the general opinion that the quantity of supplies in resale hands is comparatively small and there was a noticeable tightening up of offerings on various occasions. At the close the best price heard was 8½c. per lb. with most sellers asking 8½c. for standard brand material. A noticeable improvement in the general inquiry for *caustic soda* has taken place during the period under review. Demand has emanated from both foreign and domestic sources and enough buying orders have been shot into the market to keep prices as high as \$4.10 per 100 lb. Standard brands were offered sparingly in the late trading and the general outlook appeared quite favorable for maintenance of values. Outside makes were obtainable at a fraction below those named for standards. English caustic soda for shipment was offered at \$5 per 100 lb. N. Y. Producers quote

contracts for solid caustic at 3¼c. per lb., basis 60 per cent f.o.b. works, and 5c. per 100 lb. higher for single cars. Most dealers quoted *nitrite of soda* on spot at 7½@7¾c. per lb., and it is understood that small lot trading took place at 7¼c. per lb. and upward depending on seller. The feeling continues bullish in this material, although some factors are of the belief that the advancing tendency will likely be irregular on account of supplies being scattered. Spot *prussiate of soda* is quoted firm at 12¼@12½c. per lb., with sales noted at these figures. A fair inquiry is reaching the market for small lots and several interests are inclined to look for an advance in prices. There were rumors that eventually this chemical is likely to come under the same classification as oxalic acid and nitrite of soda, thereby requiring a license to import. Offerings of resale light *soda ash* continue quite small and dealers stated that it was doubtful if better than \$2.20 per 100 lb. could be done on any sizable quantity in single bags. Small lots were quoted at \$2.25@\$2.35 per 100 lb. Barrels were quoted at \$2.50@\$2.60 ex-store N. Y. The call for less than carlots was reported active.

Imported *barium chloride* was offered on spot at \$60 per ton and it is understood that some domestic goods can be purchased at the same price. Some business is reported in small quantities, but consumers show little interest in round lots at present. There was a noticeable scarcity of offerings in *oxalic acid* and prices were decidedly higher on a basis of 19½@20c. per lb. There was no lack of confidence on the part of dealers regarding the immediate trend of values. The ruling by the Government requiring a license to import this chemical is viewed by many to be a very strengthening factor. Leading producers of *zinc sulphate* have lowered their carlot price to \$2.90 per 100 lb. Small lots are moving at various figures up to 3¼c. per lb. The demand has not shown very much activity of late and prices have been established on a basis more attractive to the consumer. Prices on *white arsenic* are quoted lower at 6½@7½c. per lb. The demand has been extremely dull and stocks are heavy in many quarters. *Red arsenic* was also quoted slightly lower with the demand very slow. Quotations are now around 11@12c. per lb. Imported *ammonium nitrate* is offered around 7½@8c. per lb., according to seller and quantity. A fair demand has been noted. *Red phosphorus* in makers' hands is held at 50c. per lb., but the French imported material is offered at 40c. *Yellow phosphorus* from producers is quoted at 35c. per lb., as against 30c. per lb. named by importers. Carlots of *carbon tetrachloride* are offered by manufacturers at 10½c. per lb. f.o.b. N. Y. Small lots of five drums are held all the way up to 12c. per lb. Resale material is occasionally offered below these figures, but attracts little attention.

COAL-TAR PRODUCTS

Producers of coal-tar products are firmer in their views in most quarters and if any shading is possible it is only among second hands. There is a difference of opinion as to supplies among second hands, and while some say the surplus has been very much reduced, there are some who feel that stocks are still plentiful and in consequence inquiries are more to test prices and are not frequently followed by orders. There was a considerable improvement noted in the general condition of the textile industry, which is already reflected in the dyestuff market by an increase in the demand for colors.

Among intermediates *beta naphthol* is in steady demand and prices are firmer in most directions, ranging from 38@40c. per lb. Makers of *para nitraniline* are quoting prices around 85@95c. per lb., with many resellers quoting the same figures. No definite lots could be located below this level, although the majority of resellers in the market seem to be of the opinion that business on a firm basis could easily be done at 82c. per lb. The determined effort on the part of some factors to keep prices up to 85c. per lb. rather lead to the belief that the market is not very firm. Prices on *para-nitrotoluene* are lower at 85@95c. per lb., according to quantity and seller. The market on *dimethylaniline* continues quiet with prices on the spot around 41@45c. per lb. There is a probability that this figure can be shaded on firm business, but stocks in most quarters are reported quite light.

Makers are holding their prices around 60@65c. per lb., according to quantity. The market on *aniline oil* seems somewhat steadier on an increasing inquiry. Spot resale stocks are being greatly depleted and inquiries are being turned over to producers. The general market price at present is around 20c. per lb. and business can be done freely at this level in spite of the high figures named by makers, up to 27c. per lb. *Naphthalene* continues dull with the inquiry very small and resale holders willing to make concessions to move stocks. Prices as low as 7½c. per lb. are named in some directions and it is understood that even these figures can be shaded on firm business. Holders of stocks seem to be getting very tired. Refiners are still holding their quotations at 8½@9½c. for the flake and 9½@10½c. per lb. for the balls, with very little business passing.

WAXES

Traders reported a quiet market for *beeswax*, but prices held on a steady basis in nearly all instances. Primary markets are well maintained. Crude African beeswax closed unchanged at 16½@17c. per lb. Brazilian crude held at 24½@26c. With little change at primary centers the market for *carnauba wax* showed no important price revisions locally. The volume of trading was quite easy, but no selling pressure was in evidence. No. 2 North Country held at 25@26c. per lb. spot delivery. No. 3 chalky closed at 17@18c. per lb., with the No. 3 North Country at 16@17c. per lb. No. 3 North Country for forward shipment held around 15c. per lb. Arrivals of *Japan wax* were larger, but this apparently was not reflected in any weakness in prices. Importers continue to quote the market at 18@18½c. per lb. for spot goods, while for near by slightly lower figures prevailed. Mail advices from Tokio reported a quiet but steady market despite the fairly liberal holdings. The market for *paraffine wax* again seemed to favor buyers and quotations were barely steady throughout the trade, with some prominent factors credited with shading in order to attract business. The export inquiry was dull. Stocks of paraffine are said to be large considering the amount of trading. Scale wax, 118-120 deg. melting point, was offered at 2½c. per lb. in carlots.

VEGETABLE OILS

Irregularity was noted in the prices named on *chinawood oil* for forward delivery and operators said that the situation was slightly easier. Offerings were noted at 10¾@11c. per lb. in barrels, June-July shipment from the Orient, New York basis. Spot oil was nominally unchanged around the 15c. level, although scattered lots sold at points outside at some concessions. Buying interest in *coconut oil* was confined chiefly to spot and near by, in barrels, for which prices held steady in all quarters. Refined edible oil was held at 12½@12¾c. per lb., cooperage basis. Ceylon style oil in barrels closed at 10½c. asked, but this figure was not firm. Loose oil for shipment from Manila was offered at 7¾c., Coast basis, with buyers' ideas holding at 7½c. per lb. Copra was unchanged at 5c. asked, N. Y., and 4½c., nominal, Pacific Coast points. There were no sales reported. Crude domestic *peanut oil* held at 5¾@6c. per lb., buyers' tanks, f.o.b. mills. The demand was quiet and prices were barely steady. Oriental oil was in limited supply on the Coast and the prices were purely nominal around 6@6½c. per lb., sellers' tanks. Deodorized oil in barrels held at 10½c. per lb., N. Y. Crude *soya bean oil* for prompt shipment held at 5½c. per lb., sellers' tanks, Coast, with offerings reported light. Soya bean oil in barrels was unchanged here at 7¾@8c. per lb.

The St. Louis Market

ST. LOUIS, Mo., June 10, 1921.

A careful survey of the drug market disclosed that the second-hand lots in hands of weak holders are practically absorbed, which tended to give the market a better and firmer tone. The fine chemical business has been fairly good, while a more quiet condition prevails in the heavy and industrial chemical lines. Consumers are still indisposed to place large orders and anticipate their requirements. The commercial acids have improved considerably and orders of larger volume are being received.

The *caustic soda* demand continues very weak, with the big buyers adhering to the hand-to-mouth policy. Prices range from \$3.85@4.50 per 100 lb., basis 76 per cent, according to quantity purchased. The *soda ash* market is extremely dull with the prices still ranging at \$2.90 per 100 lb. and upward. *Bicarbonate of soda* is being offered in less than carlot quantities at \$2.50 per 100 lb., which figures less than the manufacturers' cost f.o.b. works, plus freight.

INDUSTRIAL CHEMICALS

Sulphur continues to enjoy a fair demand with prices holding firm at \$2 per 100 lb. for the commercial in bags. *Ammonia water* continued along the lines previously reported and some fair-sized orders are being placed. The *carbon bisulphide technical* market is not very active. The limited uses to which this material is put mitigate against an active market at this moment. *Copperas* has been slow and ruling at \$19.50@21 per ton. The *zinc* market has been very quiet the past week, with *sulphate* ruling at 3¼c. The *oxide leaded* 5 per cent is holding at 8c., while the *lead free* is ruling at 8¾c. *Soda hyposulphite* is enjoying a fair business in a routine way.

DRUGS AND PHARMACEUTICALS

Acetanilid has shown a stronger position lately. There is a limited demand for *acetphenetidin*. The *chloral hydrate* business is normal with a regular demand. *Bismuth* preparations are fairly active, but should show a greater demand, as this is the season for *bismuth salts*. The *bromides* continue to move in a very small way due to the large lots being sent into this market by the foreign manufacturers. There is a limited business transacted on *caffeine*. There has been a material increase in business for *scale salts*, particularly the iron and ammonium citrate brown scales, which has been moving very briskly in the last week or two. *Cream of tartar* is enjoying a very good demand and orders of large volume are being filled. *Ether* is holding its own. *Glycerophosphates* are moving very well at factor's schedule. The second-hand lots of *iodides* that are still disturbing this market tend to keep down an increase in business and manufacturers are getting only their routine business. Manufacturers have reduced their prices on *hard mercurials* with a fair demand. A fair-sized business on *saccharine* is reported and factors are in position to fill orders promptly. The demand for *sodium benzoate* is keeping pace with the season, and manufacturers report a brisk movement. Now that prices on *salicylates* seem to be more firmly established, there has been a noticeable increase in the demand. *Glycerine* is being freely contracted for at 16½c. for six months with protection, and buyers are urged to take advantage of what is generally considered too low a price for this item.

ACIDS

Manufacturers report an improvement in the demand for *hydrochloric*, *nitric* and *sulphuric*, commercial grades, which they attribute to the fact that many industrial plants are again in operation. *Carbolic acid crystals* has enjoyed a better demand recently. The demand for *citric acid* at this moment is practically nil, due to the unseasonable weather for soft drinks, but stocks should not be allowed to decrease as the summer season is just beginning. Due to the resumption of aniline dye manufacture, there has been a noticeable increase in the demand for *gallic acid*. The status of *phosphoric acid sirupy* is the same as *citric*, as the two commodities are allied in the manufacture of soft drinks. *Salicylic acid* is moving briskly and being a seasonable product a larger volume of business is to be expected. The market on *tartaric acid* has been firm and commanding a good demand. The *tannic acid* market is firm with a fair business.

VEGETABLE OILS

Linseed reached a maximum of 80c. and today holds at 78c. in cooperage from warehouse. The general impression of the trade is that even higher prices may prevail. *Turpentine* demand is routine with price at 61c. unfirm. The price of 10½c. for *castor oil* in drums continues very firm in spite of only a fair demand.

The Iron and Steel Market

PITTSBURGH, June 10, 1921.

The steel market in the past week has given a fresh exhibition of the depth of dullness to which it can sink. Literally an order for 100 tons is now a large one for a steel mill, and even carload orders are scarce.

STEEL PRODUCTION

The monthly report of the American Iron and Steel Institute, showing steel ingot production in May, indicates that the month's production was larger than had been estimated, even at the close of the month, for the rate of output was substantially the same as the rate in April, and indeed a shade heavier. The May average was, however, made up by a considerably higher rate than the average at the beginning of the month and a considerably lower rate at the close. An item in the same connection is that while the total output was about the same for the two months, the independents produced more in May than in April, while the Steel Corporation produced less.

Production of steel ingots, which was at a shade above 30 per cent of capacity in both April and May, is now at a rate of about 25 per cent, possibly somewhat less, and the present outlook, based on the extremely light buying and specifying of the past few days, is that a rate of 20 per cent or less will be reached before the end of June, making production at about 10,000,000 tons per annum, equal to the output in 1900, the year before the Steel Corporation was formed.

In recent weeks the steel trade has endeavored to form a conception of what is "the minimum rate of consumption" of steel, assuming simply the condition of there being "hard times" or "a severe industrial depression." Experience before the war showed that production never dropped below about 50 per cent of capacity, and it looked as if there might be a rule. The recent effort has been abandoned, it being made quite clear that the flow of steel from mills is not in relation to the severity of a business depression. The flow of steel could stop entirely and yet for a time the major part of the business of the country could be conducted, for the various users of steel could get along, to an extent, with what they had.

It is seen now that there must be a liquidation of stocks all along the line, not simply of stocks of steel in the hands of manufacturing consumers, but of stocks of their finished wares, whether in the hands of the manufacturers or the distributors, and the general public, the ultimate buyer, must develop a desire to buy and accumulate an ability. The process is expected to be slow, but the low point for many years in the flow of steel from mill is likely to be reached within a very few weeks. The probability is very strong that there will be an upturn in August, but it will be an upturn from such a low point that it will be gratifying chiefly as showing a trend in the right direction.

STEEL PRICES

It is said that there is "an open market" in steel products, though the term is not precisely defined. The attitude of the majority of sellers is that they have no particular incentive to maintain the prices lately in force and will make concessions in price if thereby they can get orders that are worth while. The difficulty is that practically no business is offered. There is reason to believe that the Steel Corporation will not do as it did last February and March, when it adhered to its regular prices despite cutting by practically all the independents. This time it is likely the corporation will meet any widespread cutting by independents. In wire products the corporation has already done this, and nails, plain wire and galvanized barb wire are quotable respectively at \$3, 2.75c. and 3.85c., or \$5 a ton below what are known as April prices. Plates, formerly at 2.20c., have sold at 2c. even in small lots, though it is not known at this writing that the Steel Corporation has met the figure. Shading in sheets is growing.

PIG IRON

Foundry pig iron at valley furnaces is off 5c. to \$22.50. Basic, which was uncertain at \$21.75, is now plainly quotable to \$21.50, bessemer remaining at \$23.

Aniline salts	lb.	.26 - .29
Anthracene, 80% in drums (100 lb.)	lb.	.75 - 1.00
Benzaldehyde U.S.P.	lb.	1.50 - . . .
Benzidine, base	lb.	.85 - 1.00
Benzidine sulphate	lb.	.75 - .85
Benzoic acid, U.S.P.	lb.	.60 - .65
Benzoate of soda, U.S.P.	lb.	.65 - .70
Benzene, pure, water-white, in drums (100 gal.)	gal.	.27 - .32
Benzene, 90%, in drums (100 gal.)	gal.	.25 - .28
Benzyl chloride, 95-97%, refined	lb.	.28 - .30
Benzyl chloride, tech.	lb.	.20 - .25
Beta-naphthol benzoate	lb.	3.50 - 4.00
Beta-naphthol, sublimed	lb.	.70 - .75
Beta-naphthol, tech.	lb.	.38 - .40
Beta-naphthylamine, sublimed	lb.	2.00 - 2.25
Cresol, U. S. P., in drums (100 lb.)	lb.	.16 - .18
Ortho-cresol, in drums (100 lb.)	lb.	.25 - .27
Cresylic acid, 97-99%, straw color, in drums	gal.	.70 - .80
Cresylic acid, 75-97%, dark, in drums	gal.	.65 - .70
Cresylic acid, 50%, first quality, drums	gal.	.45 - .50
Dichlorobenzene	lb.	.06 - .09
Diethylaniline	lb.	1.20 - 1.25
Dimethylaniline	lb.	.41 - .50
Dinitrobenzene	lb.	.32 - .35
Dinitrochlorobenzene	lb.	.20 - .30
Dinitronaphthalene	lb.	.30 - .40
Dinitrophenol	lb.	.35 - .40
Dinitrotoluene	lb.	.27 - .30
Dip oil, 25%, car lots, in drums	gal.	.40 - .45
Diphenylamine	lb.	.60 - .65
H-acid	lb.	1.25 - 1.35
Meta-phenylenediamine	lb.	1.15 - 1.20
Monochlorobenzene	lb.	.12 - .14
Monothylaniline	lb.	1.75 - 1.85
Naphthalene crushed, in bbls.	lb.	.07 - .08
Naphthalene, flake	lb.	.07 - .08
Naphthalene, balls	lb.	.08 - .09
Naphthionic acid, crude	lb.	.70 - .75
Nitrobenzene	lb.	.12 - .15
Nitro-naphthalene	lb.	.30 - .35
Nitro-toluene	lb.	.16 - .18
Ortho-amidophenol	lb.	3.10 - 3.20
Ortho-dichlor-benzene	lb.	.15 - .20
Ortho-nitro-phenol	lb.	.80 - .85
Ortho-nitro-toluene	lb.	.15 - .20
Ortho-toluidine	lb.	.20 - .25
Para-amidophenol, base	lb.	1.50 - 1.60
Para-amidophenol, HCl	lb.	1.75 - 1.80

Para-dichlorobenzene	lb.	.15 - .20
Paranitroaniline	lb.	.85 - 1.00
Para-nitrotoluene	lb.	.85 - .95
Para-phenylenediamine	lb.	1.80 - 2.00
Para-toluidine	lb.	1.25 - 1.40
Phthalic anhydride	lb.	.50 - .60
Phenol, U. S. P., drums	lb.	.11 - .13
Pyridine	gal.	2.00 - 3.50
Resorcinol, technical	lb.	1.75 - 1.85
Resorcinol, pure	lb.	2.25 - 2.30
Salicylic acid, tech., in bbls.	lb.	.21 - .22
Salicylic acid, U. S. P.	lb.	.24 - .26
Salol	lb.	.80 - .85
Solvent naphtha, water-white, in drums, 100 gal.	gal.	.25 - .28
Solvent naphtha, crude, heavy, in drums, 100 gal.	gal.	.14 - .16
Sulphanilic acid, crude	lb.	.30 - .35
Tolidine	lb.	1.25 - 1.35
Toluidine, mixed	lb.	.40 - .45
Toluene, in tank cars	gal.	.25 - .28
Toluene, in drums	gal.	.28 - .31
Xylidines, drums, 100 gal.	lb.	.40 - .45
Xylene, pure, in drums	gal.	.40 - .45
Xylene, pure, in tank cars	gal.	.45 - . . .
Xylene, commercial, in drums, 100 gal.	gal.	.33 - .35
Xylene, commercial, in tank cars	gal.	.30 - . . .

Waxes

Prices based on original packages in large quantities.

Beeswax, refined, dark	lb.	\$0.23 - \$0.25
Beeswax, refined, light	lb.	.25 - .27
Beeswax, white pure	lb.	.42 - .45
Carnauba, H. ra.	lb.	.62 - .63
Carnauba, No. 2, North Country	lb.	.27 - .28
Carnauba, No. 3, North Country	lb.	.16 - .17
Japan	lb.	.18 - .18
Montan, crude	lb.	.07 - .07
Paraffine waxes, crude match wax (white) 105-110 m.p.	lb.	.03 - .03
Paraffine waxes, crude, scale 124-126 m.p.	lb.	.02 - .03
Paraffine waxes, refined, 118-120 m.p.	lb.	.03 - .03
Paraffine waxes, refined, 125 m.p.	lb.	.04 - .04
Paraffine waxes, refined, 128-130 m.p.	lb.	.04 - .05
Paraffine waxes, refined, 133-135 m.p.	lb.	.05 - .05
Paraffine waxes, refined, 135-137 m.p.	lb.	.05 - .06
Stearic acid, single pressed	lb.	.09 - . . .
Stearic acid, double pressed	lb.	.10 - . . .
Stearic acid, triple pressed	lb.	.11 - .11

Naval Stores

All prices are f.o.b. New York unless otherwise stated, and are based on carload lots. The oils in 50-gal. bbls., gross weight, 500 lb.

Rosin B-D, bbl.	280 lb.	\$5.10 - . . .
Rosin E-I	280 lb.	5.80 - 6.00
Rosin K-N	280 lb.	6.50 - 6.70
Rosin W. G.-W. W.	280 lb.	6.80 - . . .
Wood rosin, bbl.	280 lb.	6.25 - . . .
Spirits of turpentine	gal.	.62 - . . .
Wood turpentine, steam dist.	gal.	.60 - . . .
Wood turpentine, dest. dist.	gal.	.58 - . . .
Pine tar pitch, bbl.	200 lb.	. . . - 6.75
Tar, kiln burned, bbl. (500 lb.)	bbl.	. . . - 11.50
Retort tar, bbl.	500 lb.	. . . - 11.50
Rosin oil, first run	gal.	.36 - . . .
Rosin oil, second run	gal.	.38 - . . .
Rosin oil, third run	gal.	.43 - . . .
Pine oil, steam dist., sp.gr. 0.930-0.940	gal.	\$1.80 - . . .
Pine oil, pure, dest. dist.	gal.	1.50 - . . .
Pine tar oil, ref., sp.gr. 1.025-1.035	gal.	.46 - . . .
Pine tar oil, crude, sp.gr. 1.025-1.035 tank cars f.o.b. Jacksonville, Fla.	gal.	.35 - . . .
Pine tar oil, double ref., sp.gr. 0.965-0.990	gal.	.75 - . . .
Pine tar, ref., thin, sp.gr. 1.080-1.060	gal.	.35 - . . .
Turpentine, crude, sp. gr. 0.900-0.970	gal.	1.20 - . . .
Hardwood oil, f.o.b. Mich., sp.gr. 0.960-0.990	gal.	.35 - . . .
Pinewood creosote, ref.	gal.	.52 - . . .

Solvents

73-76 deg., steel bbls. (85 lb.)	gal.	\$0.41 - . . .
70-72 deg., steel bbls. (85 lb.)	gal.	.39 - . . .
68-70 deg., steel bbls. (85 lb.)	gal.	.38 - . . .
V. M. and P. naphtha, steel bbls. (85 lb.)	gal.	.30 - . . .

Crude Rubber

Para-Upriver fine	lb.	\$0.16 - .17
Upriver coarse	lb.	.09 - .09
Upriver caucho ball	lb.	.11 - .12
Plantation—First latex crepe	lb.	.15 - . . .
Ribbed smoked sheets	lb.	.14 - .14
Brown crepe, thin, clean	lb.	.15 - . . .
Amber crepe No. 1	lb.	.17 - . . .

Oils

VEGETABLE

The following prices are f.o.b. New York for carload lots.

Castor oil, No. 3, in bbls.	lb.	\$0.08 - \$0.09
Castor oil, AA, in bbls.	lb.	.10 - .10
China wood oil, in bbls. (f.o.b. Pac. coast)	lb.	.11 - .11
Cocanut oil, Ceylon grade, in bbls.	lb.	.10 - .10
Cocanut oil, Cochon grade, in bbls.	lb.	.11 - .11
Corn oil, crude, in bbls.	lb.	.07 - .08
Cottonseed oil, crude (f. o. b. mill)	lb.	.05 - .05
Cottonseed oil, summer yellow	lb.	.07 - .08
Cottonseed oil, winter yellow	lb.	.08 - . . .
Linseed oil, raw, car lots (domestic)	gal.	.76 - . . .
Linseed oil, raw, tank cars (domestic)	gal.	.70 - . . .
Linseed oil, in 5-bbl lots (domestic)	gal.	.79 - . . .

Olive oil, Denatured.....	gal.	\$1.40	—	\$1.60
Palm, Lagos.....	lb.	.06 $\frac{1}{2}$	—	.07
Palm, Niger.....	lb.	.05 $\frac{1}{2}$	—	.06
Peanut oil, crude, tank cars (f.o.b. mill).....	lb.	.05 $\frac{1}{2}$	—	.06
Peanut oil, refined, in bbls.....	lb.	.10 $\frac{1}{2}$	—	.10 $\frac{3}{4}$
Rapeseed oil, refined in bbls.....	gal.	.86	—	.88
Rapeseed oil, blown, in bbls.....	gal.	.92	—	.94
Soya bean oil (Manchurian), in bbls. N. Y.....	lb.	.07 $\frac{1}{2}$	—	
Soya bean oil, tank cars, f.o.b., Pacific coast.....	lb.	.04 $\frac{1}{2}$	—	

FISH

Light pressed menhaden.....	gal.	\$0.40	—	\$0.41
Yellow bleached menhaden.....	gal.	.42	—	
White bleached menhaden.....	gal.	.44	—	
Brown menhaden.....	gal.	.80	—	

Miscellaneous Materials

All f.o.b. New York Unless Otherwise Stated

Barytes, ground, white, f.o.b. Kings Creek, S. C.....	net ton	\$24.00	—	30.00
Barytes, ground, off color, f.o.b. Kings Creek.....	net ton	22.00	—	26.00
Barytes, crude, 88% @ 94% ba., Kings Creek.....	net ton	10.00	—	15.00
Barytes, floated, f.o.b. St. Louis.....	net ton	26.50	—	28.00
Barytes, crude, first grade, Missouri.....	net ton	7.00	—	
Blanc fixe, dry.....	lb.	.05	—	.05 $\frac{1}{2}$
Blanc fixe, pulp.....	net ton	50.00	—	60.00

Chalk, domestic, light.....	lb.	.04 $\frac{1}{2}$	—	.05
Chalk, domestic, heavy.....	lb.	.04	—	.05
Chalk, English, extra light.....	lb.	.05	—	.07
Chalk, English, light.....	lb.	.05	—	.06
Chalk, English, dense.....	lb.	.04 $\frac{1}{2}$	—	.05
China clay (kaolin) crude, f.o.b. mines, Georgia.....	net ton	8.00	—	10.00
China clay (kaolin) washed, f.o.b. Georgia.....	net ton	12.00	—	15.00
China clay (kaolin) powdered, f.o.b. Georgia.....	net ton	18.00	—	22.00
China clay (kaolin) crude f.o.b. Virginia points.....	net ton	8.00	—	12.00
China clay (kaolin) ground, f.o.b. Virginia points.....	net ton	15.00	—	40.00
China clay (kaolin), imported, lump.....	net ton	23.00	—	25.00
China clay (kaolin), imported, powdered.....	net ton	30.00	—	35.00
Feldspar, crude, f.o.b. Maryland and North Carolina points.....	gross ton	8.00	—	14.00
Feldspar, crude, f.o.b. Maine.....	net ton	7.50	—	10.00
Feldspar, ground, f.o.b. Maine.....	net ton	21.00	—	23.00
Feldspar, ground, f.o.b. North Carolina.....	net ton	17.00	—	21.00
Feldspar, ground, f.o.b. N. Y. State.....	net ton	17.00	—	21.00
Feldspar, ground, f.o.b. Baltimore.....	net ton	27.00	—	30.00
Fullers earth, f.o.b. Mines.....	net ton	16.00	—	17.00
Fullers earth, granular, f.o.b. Pa.....	net ton	15.00	—	18.00
Fullers earth, powdered, f.o.b. Fla.....	net ton	18.00	—	
Fullers earth, imported, powdered.....	net ton	24.00	—	27.00
Graphite, Ceylon lump, first quality.....	lb.	.07 $\frac{1}{2}$	—	.08
Graphite, Ceylon chip.....	lb.	.06	—	.06 $\frac{1}{2}$
Graphite, high grade amorphous crude.....	lb.	.02 $\frac{1}{2}$	—	.03
Pumice stone, imported, lump.....	lb.	.04	—	.50
Pumice stone, domestic lump.....	lb.	.05	—	.05 $\frac{1}{2}$
Pumice stone, ground.....	lb.	.06	—	.07
Quartz (acid tower) first to head, f.o.b. Baltimore.....	net ton		—	10.00
Quartz (acid tower) 1 $\frac{1}{2}$ @2 in., f.o.b. Baltimore.....	net ton		—	14.00
Quartz (acid tower) rice, f.o.b. Baltimore.....	net ton		—	17.00
Quartz, lump, f.o.b. North Carolina.....	net ton	5.00	—	7.50
Shellac, orange fine.....	lb.	.75	—	
Shellac, orange superfine.....	lb.	.79	—	.82
Shellac, A. C. garnet.....	lb.	.55	—	.58
Shellac, T. N.....	lb.	.70	—	.72
Soapstone.....	ton	12.00	—	15.00
Sodium chloride.....	long ton	12.50	—	13.00
Talc, paper-making grades, f.o.b. Vermont.....	ton	11.00	—	20.00
Talc, roofing grades, f.o.b. Vermont.....	ton	8.50	—	13.00
Talc, rubber grades, f.o.b. Vermont.....	ton	11.00	—	18.00
Talc, powdered, Southern, f.o.b. cars.....	ton	10.00	—	14.00
Talc, imported.....	ton	35.00	—	40.00
Talc, California talcum powder grade.....	ton	18.00	—	40.00

Refractories

Bauxite brick, 56% Al, f.o.b. Pittsburgh.....	per ton	\$35.00—50.00
Carborundum refractory brick, 9-in. { less than carlot	1,000	1250.00
Carborundum refractory brick, 9-in. { carload lots	1,000	1100.00
Chrome brick, f.o.b. Eastern shipping points.....	net ton	75—90
Chrome cement, 40—45% Cr ₂ O ₃	net ton	45—50
Chrome cement, 40—45% Cr ₂ O ₃ , sacks, in car lots, f.o.b. Eastern shipping points.....	net ton	 55
Fireclay brick, 1st quality, 9-in. shapes, f.o.b. Pennsylvania, Ohio and Kentucky works.....	1,000	40—50
Fireclay brick, 2nd quality, 9-in. shapes, f.o.b. Pennsylvania, Ohio and Kentucky works.....	1,000	40—50
Magnesite brick, 9-in. straight.....	net ton	90
Magnesite brick, 9-in. arches, wedges and keys.....	net ton	100
Magnesite brick, soaps and splits.....	net ton	110
Silica brick, 9-in. sizes, f.o.b. Chicago district.....	1,000	45—55
Silica brick, 9-in. sizes, f.o.b. Birmingham district.....	1,000	45—55
Silica brick, 9-in. sizes, f.o.b. Mt. Union, Pa.....	1,000	45—55

Ferro-Alloys

All f.o.b. Works

Ferro-titanium, 15-18%, f.o.b. Niagara Falls, N. Y.....	net ton	\$200.00 — \$225.00
Ferrocchrome per lb. of Cr. contained, 6-8% carbon, carlots.....	lb.	.15 — .16
Ferrocchrome, per lb. of Cr. contained, 4-6% carbon, carlots.....	lb.	.16 — .17
Ferromanganese, 76-80% Mn, domestic.....	gross ton	75.00 — 80.00
Ferromanganese, 76-80% Mn, English.....	gross ton	75.00 — 80.00
Spiegeleisen, 18-22% Mn.....	gross ton	30.00 — 32.00
Ferromolybdenum, 50-60% Mo, per lb. of Mo.....	lb.	2.50 —
Ferrosilicon, 10-15%.....	gross ton	45.00 — 50.00
Ferrosilicon, 50%.....	gross ton	75.00 — 80.00
Ferrosilicon, 75%.....	gross ton	140.00 — 145.00
Ferrotungsten, 70-80%, per lb. of contained W.....	lb.	.45 — .50
Ferrouanium, 35-50% of U, per lb. of U content.....	lb.	6.00 —
Ferrovandium, 30-40% per lb. of contained V.....	lb.	5.00 — 6.50

Ores and Semi-finished Products

All f.o.b. New York, Unless Otherwise Stated

Bauxite, 52% Al content.....	gross ton	\$8.00 — \$10.00
Chrome ore, Calif. concentrates, 50% min. Cr ₂ O ₃	unit	.45 — .50
Chrome ore, 50% Cr ₂ O ₃ , f.o.b. Atlantic seaboard.....	unit	.45 — .50
Coke, foundry, f.o.b. ovens.....	net ton	4.00 — 4.50
Coke, furnace, f.o.b. ovens.....	net ton	3.25 — 3.75
Coke, petroleum, refinery, Atlantic seaboard.....	net ton	15.00 — 16.00
Fluorspar, lump, f.o.b. mines, New Mexico.....	net ton	15.00 —
Fluorspar, standard, domestic washed gravel Kentucky and Illinois mines.....	net ton	20.00 — 22.50
Ilmenite, 52% TiO ₂ , per lb. ore.....	lb.	.01 $\frac{1}{2}$ — .01 $\frac{3}{4}$
Manganese ore, 50% Mn, c.i.f. Atlantic seaport.....	unit	.25 —
Manganese ore, chemical (MnO ₂).....	gross ton	60.00 — 65.00
Molybdenite, 85% MoS ₂ , per lb. of MoS ₂ , N. Y.....	lb.	.55 — .60
Monazite, per unit of ThO ₂ , c.i.f., Atlantic seaport.....	unit	30.00 —
Pyrites, Spanish, fines, c.i.f., Atlantic seaport.....	unit	.14 — .14
Pyrites, Spanish, furnace size, c.i.f. Atlantic seaport.....	unit	.14 — .14
Pyrites, domestic, fines, f.o.b. mines, Ga.....	unit	.12 — .13
Rutile, 95% TiO ₂ per lb. ore.....	lb.	.15 —
Tungsten, scheelite, 60% WO ₃ and over, per unit of WO ₃ (nominal).....	unit	2.75 — 3.00
Tungsten, wolframite, 60% WO ₃ and over, per unit of WO ₃ , N. Y. C.....	unit	3.00 — 3.25
Uranium ore (carnotite) per lb. of U ₃ O ₈	lb.	1.50 — 2.50
Uranium oxide, 96% per lb. contained U ₃ O ₈	lb.	2.25 — 2.50
Vanadium pentoxide, 99%.....	lb.	12.00 — 14.00
Vanadium ore, per lb. of V ₂ O ₅ contained.....	lb.	1.50 —
Zircon, washed, iron free.....	lb.	.03 —

Non-Ferrous Metals

New York Markets

Copper, electrolytic.....	Cents per Lb.	13.00—13.25

Financial, Construction and Manufacturers' News

Construction and Operation

California

FRESNO—The Fresno Tire & Rubber Co., has awarded a contract to the Unit Construction Co., Phelan Bldg., San Francisco, for the erection of a 3-story automobile tire and rubber goods manufacturing plant at Tehama and Belmont Aves., to cost about \$200,000 with machinery. S. H. Christian, sales manager, is in charge.

SACRAMENTO—The United States Electric Steel Products Co., Inc., is planning for the erection of a new plant at Sacramento, and has acquired a large tract of land for this purpose. According to a statement from officials of the Chamber of Commerce, Vallejo, Cal., the company is planning for the erection of a branch plant on the Vallejo waterfront. Headquarters of the company are at San Francisco; it is capitalized at \$50,000,000. The Electric Furnace Construction Co., 908 Chestnut St., Philadelphia, Pa., is interested in the project, and will handle the electric furnace installations at the plants. It is said that the main Sacramento works will cost about \$5,000,000.

SAN MATEO—The Illinois-Pacific Glass Co., Fifteenth and Folsom Sts., San Francisco, is negotiating with the Chamber of Commerce, San Mateo, for a suitable site for the erection of a new local plant for the manufacture of glass products.

Connecticut

WATERBURY—The Scovill Mfg. Co., East Main St., manufacturer of brass products, has filed plans for the erection of a 1-story brick plant addition, 49 x 96 ft., to cost about \$15,000.

WINDSOR—The Apothecaries Hall Co., 24 Benedict St., has awarded a contract to the Clark Construction Co., 168 Grand St., Waterbury, Conn., for the erection of a new 1-story fertilizer manufacturing and mixing plant, 64 x 140 ft., to cost about \$27,000. William Stall is head.

NORWALK—Charles H. Harris, Inc., 136 West 24th St., New York, has awarded a contract to Levering & Garrigues, 552 West 23d St., for the erection of a new 1-story plant on Main St., 100 x 200 ft., for the manufacture of glass for automobile windshields. The new plant will cost about \$75,000. Charles H. Harris is president.

Florida

LAKE WORTH—The Florida Sugar & Food Products Co., 110 South Dearborn St., Chicago, Ill., F. E. Bryant, president and manager, is perfecting plans for the erection of its proposed new sugar mill in the vicinity of Lake Worth to be 100x200 ft., with equipment to provide for an initial daily capacity of 500 tons of cane sugar. N. K. Williams, Canal Point, Fla., is construction engineer for the project.

Illinois

CHICAGO—The By-Products Coke Corp., 332 South Michigan Ave., has arranged for a bond issue of \$4,000,000 for operations, financing, etc. H. H. S. Handy is president.

BLOOMINGTON—The Illinois Oakoal Corp., Bryant Bldg., Kansas City, Mo., has awarded a contract to the Frank P. McClure Construction Co., Kansas City, for the erection of its proposed new plant at Bloomington, estimated to cost about \$100,000 with equipment.

CHICAGO—William J. Korber & Co., 413 North Carpenter St., operating a general iron works, have taken construction bids for a 1-story addition, 50x110 ft., on California St., to cost about \$12,000. William J. Korber is head.

Indiana

COLUMBUS—The Indiana Oil Refining Co. has awarded a contract to the Graver Corporation, East Chicago, Ind., for the erection of its proposed new local oil refinery, consisting of a first plant unit, estimated to cost about \$120,000. It is proposed to have the plant ready for operation in the fall.

SOUTH BEND—The Odell Rubber Co., recently organized with a capital of \$50,000, is planning for the erection of a new plant for the manufacture of automobile tires at Paducah, Ky.

TERRE HAUTE—The American Car & Foundry Co. has plans under way for the rebuilding of the section of its local plant, recently destroyed by fire with loss of about \$150,000, including equipment.

Kansas

WICHITA—The Wichita Dehydration Co., 616 Mutual Bank Bldg., has broken ground for the erection of a new 1-story and basement dehydration plant, with initial capacity of about 50 tons per day, estimated to cost about \$50,000 with equipment. T. C. Naylor, 311 Beacon Bldg., is the contractor. J. H. Elem is president.

Kentucky

SCOTTSVILLE—The Massey Refining Co. is planning for the erection of a new oil refinery, with initial capacity of about 500 bbl. per day. S. H. Massey and L. R. McKee head the company.

Maryland

BALTIMORE—The Virginia-Carolina Chemical Co., 11 South Twelfth St., Richmond, Va., is considering the construction of a new fertilizer manufacturing plant at Baltimore, with main building 100x200 ft., estimated to cost in excess of \$2,500,000. S. D. Grenshaw is secretary.

BALTIMORE—The Holtite Mfg. Co., 919 East Baltimore St., has awarded a contract to R. B. Mason, 308 West Madison St., for the erection of its proposed new local plant, 50x142 ft., for the manufacture of rubber specialties, estimated to cost about \$58,000, and of which amount approximately \$30,000 will be used for equipment. Albert A. Esterson is secretary and treasurer.

CUMBERLAND—The Queen City Brick & Tile Co. is making extensions and improvements in its plant for increased production. The company recently increased its capital from \$100,000 to \$200,000. Henry J. Glick is president.

BALTIMORE—The American Sugar Refining Co., 117 Wall St., New York, N. Y., has filed plans for the main refinery unit at its new local plant at Woodall and Clements Sts., to be 9-story, 60x164 ft. Stone & Webster, 120 B'way, New York, have the building contract.

Massachusetts

BROCKTON—George Baker & Sons, Inc., 103 Belmont St., manufacturer of nails, studs, staples, etc., will occupy the new 1- and 2-story plant, 83x223 ft., to be erected by the Baker Realty Co., an affiliated organization, on North Monticello St. It will cost about \$75,000. George Howard & Sons, Inc., 633 Warren St., is the contractor.

Michigan

MONROE—The River Raisin Paper Co. has placed the first unit of its new local plant in operation, consisting of a building section 60 to 80 ft. x 720 ft., with capacity of about 60 tons per day. The new unit will be used primarily for the manufacture of corrugated strawboard. The entire plant of the company as now designed will develop an output of about 700,000 lb. of stock per day, and will give employment to approximately 1,500 operatives.

Missouri

CHILLICOTHE—The Moonshine Mfg. Co. has preliminary plans under way for the erection of a new plant for the manufacture of lubricants, cleaners, etc.

SELIGMAN—The Silver Lake Mining Co. is planning for the installation of new mining machinery and operating equipment at its local silver mines. A large new acreage will be developed. T. R. Gilliam is vice-president.

KANSAS CITY—A. W. Estabrook, 729 Holmes St., has construction under way on a new chemical laboratory, 2-story and basement, 40x60 ft., estimated to cost about \$15,000.

ST. LOUIS—The Missouri Chemical Works, 1501 South Second St., is reported to be planning for the rebuilding of the portion of its plant, recently destroyed by fire, with loss estimated at \$50,000. Arthur G. Whittaker is secretary.

LEEDS—The National Lumber & Creosoting Co., Houston, Tex., is planning for the establishment of a new creosoting plant at Leeds, with annual capacity of about 40,000,000 ft. of material.

KANSAS CITY—The Kansas City Wire & Iron Works is planning for the rebuilding of the portion of its plant recently destroyed by fire with loss estimated at \$80,000.

New Jersey

NEWARK—John Campbell & Co., New York Ave., manufacturer of bookbinders' materials, leather, etc., have filed plans for extensions and improvements in their refinery to cost about \$10,000.

New York

NEW YORK—The Pierce Oil Corp., 25 Broad St., is planning for a bond issue of \$12,000,000, the proceeds to be used for expansion, refinery extensions, operations, etc.

North Carolina

WILMINGTON—The Shepard Chemical Co. is reported to be planning for the rebuilding of the portion of its plant recently destroyed by fire. E. C. Dickinson is head.

Oklahoma

BEGGS—The Taylor Oil & Gas Co., Okmulgee, Okla., is planning for the erection of a new two-unit compression gasoline plant in the vicinity of Beggs.

ARDMORE—The Cameron Refining Co. has commenced enlargements at its plant, to increase the capacity from 3,000 to 4,000 bbl. per day.

BARTLESVILLE—The Chamber of Commerce, E. L. George, secretary, is developing plans for the establishment of a new local plant for the manufacture of automobile tires and rubber goods.

Pennsylvania

BUTLER—The Valvoline Oil Co. is planning for the rebuilding of its local works, destroyed by fire May 29, with loss estimated at about \$400,000, including equipment and stock.

PHILADELPHIA—Samuel McDowell, 1215 Filbert St., manufacturer of chemicals, has taken title to a plant building at Girard Ave. and 59th St., on site 178x223 ft., to be used in connection with local operations. The structure was used formerly by the Providence Worsted Mills.

Tennessee

CHATTANOOGA—The Ocoee Copper Co. is planning for the erection of a new flotation plant in the vicinity of Ducktown, Tenn., with initial capacity of about 300 tons per day, and estimated to cost about \$200,000. P. B. Carter is secretary and treasurer.

Texas

BETHANY—J. B. Haynes, Houston, Tex., and associates are organizing a company to construct a large plant in the vicinity of Bethany for the manufacture of carbon black. It is proposed to utilize natural gas from the oil wells in this district for the new works, and application for permission to carry out the plans has been made to the State Railroad Commission.

TEMPLE—The T. S. Huddleston Mining Co., Belton, Tex., is planning for the establishment of a new works in the vicinity of Temple for the production of fullers earth. The company has extensive deposits in this section.

Virginia

WINCHESTER—The Cornwall Lime Marl Co., Romney, W. Va., has plans under way for the erection of a new plant for lime production in the vicinity of Winchester, with initial capacity of about 125 tons of material per day. The company will develop extensive lime marl deposits in this district. John J. Cornwall is president.

Wisconsin

SOUTH MILWAUKEE—The Bucyrus Co., manufacturer of excavating machinery, is taking bids for the erection of a new 1-story addition to its iron foundry, 66x220 ft.

Capital Increases, Etc.

THE ALUMINUM CHEMICAL Co., Chicago, Ill., has filed notice of increase in capital from \$100,000 to \$200,000.

THE CHAMPLAIN PULP & PAPER CORP., Saratoga Springs, N. Y., has filed notice of dissolution under state laws.

THE ANSBACHER INSECTICIDE Co., 527 Fifth Ave., New York City, has filed notice of increase in capital from \$10,000 to \$150,000.

THE A. H. ANDERSON FOUNDRY Co., 218 Ann St., Chicago, Ill., manufacturer of brass castings, etc., has filed notice of increase in capital from \$5,000 to \$100,000.

THE ROWELL OIL MILLS Co., Bastrop, Tex., manufacturer of cottonseed oils, etc., has filed notice of increase in capital from \$27,000 to \$75,000.

THE LONG ISLAND BRICK Co., 280 Madison Ave., New York City, with brick manufacturing plant at Farmingdale, L. I., has filed notice of increase in capital to \$800,000.

THE LYSTER CHEMICAL Co., 61 B'way, New York City, has filed schedules in bankruptcy with liabilities stated as \$184,458, and assets as \$98,180.

THE ROOSEVELT DRUG & CHEMICAL Co., 117-19 Smith St., Perth Amboy, N. J., has filed notice of dissolution under state laws.

THE AMERICAN SILICA PRODUCTS Co., Indianapolis, Ind., has filed notice of dissolution under state laws.

THE MONARCH-NUSBAUM PAPER BOX Co., 106 B'way, Buffalo, N. Y., has filed notice of increase in capital from \$10,000 to \$150,000.

THE MILES FIBER PRODUCTS Co., Chicago, Ill., has filed notice of increase in capital from \$20,000 to \$60,000.

THE HOSKIN-MORAINVILLE PAPER Co., Menominee, Mich., has filed notice of increase in capital from \$750,000 to \$1,000,000.

New Companies

THE NORMAL APPARATUS Co., 217-23 West Huron St., Chicago, Ill., has been incorporated with a capital of \$15,000 to manufacture chemicals and affiliated products. The incorporators are Carl F. W. Pfeiffer, Charles J. Deegan and E. Merckle.

THE ATLANTIC TANNING EXTRACT Co., New York City, has been incorporated under New Jersey laws, with capital of 2,500 shares of stock, to manufacture synthetic extracts for tanning and kindred products. The company is represented by Arthur W. Britton, 65 Cedar St.

THE AMERICAN METALLURGICAL CORP., Boston, Mass., has been incorporated with a capital of \$50,000 to operate a metallurgical works. Harry O. Breaker is president, and Kristian A. Juthe, Newton Center, Mass., treasurer.

THE EASTERN CHEMICAL Co., Boston, Mass., has been incorporated with a capital of \$50,000 to manufacture chemicals and chemical byproducts. Henry A. Smith is president, and Joseph J. McCloskey, 294 Washington St., treasurer.

THE NEW JERSEY LITHO & PRINTING INK Co., East Rutherford, N. J., has been incorporated with a capital of \$25,000 to manufacture inks. The incorporators are Frederick Prinzing, John F. Lavery and Albert E. Williams, East Rutherford.

THE EAGLE CONVEX GLASS SPECIALTY MFG. Co., Clarksburg, W. Va., has been incorporated with a capital of \$50,000 to manufacture glass products. The incorporators are Edgar Forneus and Frank Aucremanne, Clarksburg.

THE FI-BISTOS MFG. Co., New York City, has been incorporated with a capital of \$100,000 to manufacture chemicals and chemical byproducts. The incorporators are H. H. Blackmer, G. Pantzer and D. C. Godwin, 165 West 31st St.

THE NATIONAL CASEIN Co., 613 West 80th St., Chicago, Ill., has been incorporated with a capital of \$15,000 to manufacture glues and kindred products. The incorporators are Richard P. Poulton, Joseph A. Rogers and William E. Rodrigues.

THE STONE FORT OIL Co., Houston, Tex., has been incorporated with a capital of \$150,000 to manufacture petroleum products. The incorporators are Taylor J. Hughes, T. P. Griffin and V. F. Nehaus, Houston.

J. E. TEMPLETON & Co., Inc., Westfield, Mass., has been incorporated with a capital of \$20,000 to manufacture chemicals, oils, etc. Louis M. Fuller is president; and James E. Templeton, Westfield, treasurer.

THE NEW ENGLAND SMELTING WORKS, INC., Springfield, Mass., has been incorporated with a capital of \$25,000 to manufacture metal products. Abraham J. Saffer is president, and Morris Levin, 119 Massachusetts St., treasurer.

MIR, CODINA & MARQUES, INC., Jersey City, N. J., has been incorporated with a capital of \$125,000 to manufacture cork products. The incorporators are Lewis Mir, Peter Codina and Michael Marques, 592 Montgomery St.

THE DARLING PRODUCTS, INC., Albany, N. Y., has been incorporated with a capital of \$25,000 to manufacture compounds, baking powders and kindred specialties. The incorporators are F. E. B. and H. S. Darling, and A. Bonesteel, Albany. T. J. Quillinan, Troy, N. Y., represents the company.

THE A. A. NOE CHEMICAL Co., Rogersville, Tenn., has been incorporated with a capital of \$15,000 to manufacture chemicals and chemical byproducts. A. A. Noe and J. L. Cunningham, Rogersville, head the company.

THE CRAFTEX OIL Co., Crafton, Pa., has been incorporated with a capital of \$500,000 to manufacture petroleum products. The incorporators are S. H. Fisher, H. C. Schada and A. T. Cushing, Crafton.

THE HUMMEL & ROBINSON CORP., New York City, has been incorporated with a capital of \$100,000 to manufacture chemicals and chemical byproducts. The incorporators are J. C. Robinson, C. P. Swaffield and A. Hummel. The company is represented by G. J. Gruenberg, 320 B'way.

THE SOUTH JERSEY IRON FOUNDRY, INC., Pleasantville, N. J., has been incorporated with a capital of \$10,000 to manufacture iron and steel castings. Wray C. Arnold, Commonwealth Bldg., Philadelphia, Pa., represents the company.

THE LANG-HORTON TANNING Co., INC., Hutton, Garrett Co., Md., has been incorporated with a capital of \$100,000 to manufacture leather products. The incorporators are J. Harry Lang, Nathan Fried and LeRoy Morton, Hutton.

PHILLIPS & JAFFRAY, INC., New York City, has been incorporated with a capital of \$25,000 to manufacture soluble oils, sizing, etc. The incorporators are H. C. Good, B. D. Phillips and S. L. Jaffray. The company is represented by J. W. Hyde, 29 B'way.

THE BRISTOL STOVE & FOUNDRY Co., INC., Bristol, Va., has been incorporated with a capital of \$50,000 to manufacture iron and steel castings, etc. H. E. Wilkinson is president and J. C. Rucker, secretary, Bristol.

THE TANGHE BROTHERS Co., Detroit, Mich., has been incorporated with a capital of \$25,000 to manufacture bricks and other burned clay products. The incorporators are R. M., Henry F. and Edward F. Tanghe, 1233 Pine St.

THE MOCHAR LEATHER GOODS CORP., New York City, has been incorporated with a capital of \$15,000 to manufacture leather specialties. The incorporators are B. Char-sky, W. E. Mock and H. J. Woronov. The company is represented by A. M. Bloch, 185 Madison Ave.

THE ARKANSAS CRUDE OIL Co., Little Rock, Ark., has been incorporated with a capital of \$200,000, to manufacture petroleum products. The incorporators are Charles Leiger and E. W. Emerson, Little Rock.

THE RIVERSIDE FULLERS EARTH Co., Riverside, Tex., has been incorporated with a capital of \$50,000 to operate a producing works for fullers earth and similar products. The incorporators are T. R. Buell, E. P. Darrigrand and S. C. Collins, Riverside.

THE ORION PAINT Co., New York City, has been incorporated with a capital of \$10,000 to manufacture paints, varnishes, etc. The incorporators are C. D. Cregan, J. W. Linck and L. Bennett, 61 B'way.

THE BLUE GRASS PRODUCTION Co., 1504 Standard Trust Bldg., Chicago, Ill., has been organized to manufacture refined oil products. George B. Harker and A. S. Sorenson head the company.

THE PINEVILLE PETROLEUM Co., Pineville, Ky., has been incorporated with a capital of \$40,000 to manufacture petroleum products. The incorporators are W. L. Moss and A. R. Anderson, Pineville.

THE CHEMICAL SERVICE & SALES CORP., New York City, has been incorporated with a capital of \$15,000 to manufacture chemical specialties. The incorporators are E. Celler, M. Kraushaar and J. Maroona. Celler & Kraushaar, 51 Chambers St., represent the company.

HARRY L. IKE, INC., Dover, N. J., has been incorporated with a capital of \$25,000 to manufacture paints, varnishes, etc.

The incorporators are Harry L. Ike, Arthur V. Casterline and Herbert T. Hartley, Dover.

THE ALTO RUBBER Co., New York City, has been incorporated with a capital of \$6,000 to manufacture rubber varnish, glues, and kindred products. The incorporators are R. Schliesel, S. Moore and H. Hewitt. The company is represented by S. D. Levy, 302 B'way.

THE MENDENHALL TORPEDO Co., Duncan, Okla., has been incorporated with a capital of \$20,000 to manufacture explosives. The incorporators are G. L. Wilson, Duncan; W. B. Hamilton and T. W. Mendenhall, both of Wichita Falls, Tex.

THE TEXAS EAGLE OIL & REFINING Co., Fort Worth, Tex., has been incorporated with a capital of \$25,000, to manufacture refined oil products. The incorporators are E. B. Eakle, and F. A. Cok, Fort Worth.

THE SCHAEFER DRUG CORP., New York City, has been incorporated with a capital of \$50,000 to manufacture chemicals, drugs, etc. The incorporators are O. and E. W. Schaefer, and M. Boehringer. The company is represented by B. Swartz, 192 B'way.

THE HUDSON RIVER FOUNDRY Co., Poughkeepsie, N. Y., has been incorporated with a capital of \$10,000 to manufacture iron and other metal castings. The incorporators are J. Hanson, H. B. Vosburgh and C. W. H. Arnold, Poughkeepsie.

THE MAURICE OIL CORP., Duncan, Okla., has been incorporated with a capital of \$200,000 to manufacture petroleum products. The incorporators are W. E. Hawley, Duncan; and J. L. Hill, Wichita Falls, Tex.

THE RAE DRUG & CHEMICAL Co., Pittsburgh, Pa., is being organized by Joseph Davis, Harry J. Kane and N. Leivrerri, to manufacture chemical products. The company is represented by Harrison Bock, 1412 Berger Bldg., Pittsburgh.

Coming Meetings and Events

AMERICAN CERAMIC SOCIETY's summer meeting will be held at Canton, Alliance, Sebring and East Liverpool, Ohio, July 25 to 27. Headquarters will be at the Hotel Courtland, Canton, Ohio.

AMERICAN CHEMICAL SOCIETY, THE SOCIETY OF CHEMICAL INDUSTRY and the American Section of the latter society will hold a joint meeting in New York, Sept. 6 to 10.

AMERICAN ELECTROCHEMICAL SOCIETY will hold its fall meeting in Lake Placid, N. Y., Sept. 29 and 30, and Oct. 1.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS will hold its spring meeting June 20 to 24 at Detroit. Industrial excursions will be made to Ann Arbor, Saginaw, Midland and Bay City.

AMERICAN MINING CONGRESS AND NATIONAL EXPOSITION OF MINES AND MINING EQUIPMENT will hold its twenty-fourth annual convention in the Coliseum, Chicago, Oct. 17 to 22.

AMERICAN SOCIETY FOR STEEL TREATING will hold its third annual convention and exhibition Sept. 19 to 24 at Indianapolis.

AMERICAN SOCIETY FOR TESTING MATERIALS will hold its 1921 annual meeting in the New Monterey Hotel, Asbury Park, N. J., during the week of June 20. Technical sessions are scheduled as follows: Tuesday, on Preservative Coatings and Textiles; Wednesday, on Cement, Concrete and Road Materials; Thursday, on Ceramics, Lime and Gypsum, on Petroleum Products and on Testing Methods; Friday, on Metals.

THE NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (SEVENTH) will be held during the week of Sept. 12 in the Eighth Coast Artillery Armory, New York City.

NATIONAL FERTILIZER ASSOCIATION will hold its twenty-eighth annual convention at the Greenbrier Hotel, White Sulphur Springs, W. Va., the week beginning June 20.

NATIONAL LIME ASSOCIATION is holding its annual convention in New York City June 15 to 17.

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stettens Restaurant, 842 Broad St., Newark, N. J., the second Monday of every month.

SOCIETY OF CHEMICAL INDUSTRY (BRITISH) at the invitation of the Montreal section will hold its annual meeting in Montreal and other Canadian cities during the week of Aug. 29, 1921. Details will be printed in this magazine from time to time.

Number 25

Useful Statistics for The Chemical Industries

STATISTICS should be useful as well as interesting. We note, with a great deal of interest, the preliminary figures for the quinquennial census of manufactures, which indicate that in 1919 the chemical industries and those closely allied with them had an output valued at 15.65 billions of dollars, or almost exactly one-quarter of the total for all manufactures of the country. To the historian and the economist these figures are of value, but they are not useful in the sense that they are vital to the daily conduct of business. There is a recognized need for quick diagnosis.

Recently the report of the American Engineering Council's committee on the elimination of waste in industry pointed out that, among other needed reforms, "A national industrial information service should be established to furnish more timely, regular and complete information covering current production and consumption and stocks of commodities." This is in keeping with Mr. HOOVER's announced plans for making the work of the Department of Commerce more effective as an aid to business. The Secretary has repeatedly advocated the collection of industrial statistics which would be broad enough in scope to furnish an accurate picture of the business conditions of the country, and at the same time would be limited to a relatively few articles for which the data could be quickly compiled and distributed. Fortunately such a movement is already in progress. Directly following a recent conference between Mr. HOOVER and representatives of the industry, the Census Bureau has prepared to collect and publish promptly the monthly production and stocks of a few basic chemicals which will serve as an index to the trend of business in the chemical industries. A tentative list of a half-dozen commodities has been selected, and included in this number, of course, is sulphuric acid, the recognized barometer of all industrial activity. Later, perhaps, the work thus started can be extended. Additional commodities can be covered or the field can be broadened to include other useful data, such as the proportion of the productive capacity in actual operation, stocks in the hands of dealers and consumers, and wholesale and retail prices.

Much benefit can confidently be expected from this service. A program of industry based on accurate statistical information will encourage the manufacturer to produce his output for a consuming rather than a speculating market. The consumer will be assured of a safe and adequate supply at a price determined by sound economic principles. Waste caused by unbalanced production will gradually be eliminated.

Our chemical manufacturers should be among the first to recognize this opportunity, and we feel justified, therefore, in urging their support to the Government's efforts to establish a useful statistical service.

Industrial Alcohol And Prohibition

"INDUSTRIAL alcohol be dammed; you know it's all booze." This statement, reported to have been made by one high in the councils of prohibition, expresses rather forefully a belief which is all too prevalent among laymen. Misconceptions such as this have been largely responsible for certain pending legislation, the enactment of which will mean disaster for the chemical industries. The ostensible purpose of the Volstead supplemental prohibition bill is to prevent the use of beer as a medicine, but it has been used as a means of striking a blow at industrial alcohol, the chemical essential to the production of important medicinals and pharmaceuticals, of dyes and organic chemicals, of celluloid and smokeless powder, and of innumerable other daily necessities.

It is a well-known fact that the new legislation is sponsored by the Anti-Saloon League and has largely been brought about through its influence. The prime movers in this powerful organization are either ignorant of the requirements of the chemical industries or, with complete disregard of the national welfare, have determined to penalize these industries because prohibition has failed in certain important respects. It has been proved conclusively that these failures are attributable to maladministration of the national prohibition act and not to inadequate law. Representatives of the chemical industries in a recent meeting, which is reported elsewhere in this issue, have vigorously protested against the administration of the existing act by careless, inefficient prohibition officials, whose ignorant and often criminal laxity has continually discouraged and annoyed legitimate enterprise.

The national prohibition act gave industrial alcohol a definite legal status, since one of its expressed purposes was "to insure an ample supply of alcohol and to promote its use in scientific research and in the development of fuel, dye and the lawful industries." Another section of the law was designed "to place the non-beverage alcohol industry and other industries using such alcohol as a chemical raw material or for other lawful purposes upon the highest plane of scientific and commercial efficiency."

The proposed supplementary legislation in many ways nullifies the provisions of the original act. For instance, the unrestricted use, under proper regulations, of non-beverage alcohol is repealed and the power is given to the prohibition commissioner to grant only "the permits that are necessary to supply the actual needs for non-beverage purposes and shall limit the supply and use of all liquor save denatured alcohol and denatured rum, unfit for internal use, to such non-beverage purposes." Objection is also raised to the new bill because it is believed that the dual control of applications and permits by the Attorney General and the prohibition

commissioner will place additional delay and restrictions in the path of the legitimate consumer. Other features viewed with alarm are the provisions that the applicant must post a public notice that he intends to use alcohol in his business and that "any federal or state officer or any person authorized thereto by any such officer may oppose any such application." The alcohol user is thus not only given the former status of the saloonkeeper but the conduct of his business is safely placed in "official" hands.

The new Volstead bill, whether it is enacted or not, has proved a lesson to all friends of industrial alcohol. It has pointed out an urgent duty to be performed by chemists individually and as a profession. The public must be educated to appreciate the difference between industrial alcohol and "booze"; the essential needs of the chemical industries must be recognized. The layman must be brought to a realization of the important rôle played by alcohol—the chemical—in the industries which contribute his medicines, his foods, his recreation and his defense.

High Costs in Producing Steel

WITHIN the space of a single twelvemonth we have two cases, arising from precisely opposite influences, of the abnormally high cost of producing steel. A year ago and less the cost was abnormally high because the demand was exceptionally heavy. Now it is because the demand is exceptionally light.

In the summer of last year blast furnaces paid \$18 and more per net ton at ovens for Connellsville coke, and steel mills paid \$12 and more per net ton at mine for gas and steam coal. Some workmen got bonuses or special emoluments for working or for being on hand with a chance that they might work. They were classed in some cases as being more skilled than they were, so that they could be listed on the payroll at higher wage rates. All this was done simply to swell production slightly. Not all mills engaged in these practices, there being some well-marked exceptions. Those that did could have run along with a slightly lower output and a much lower cost of production, but demand was exceptionally insistent and fancy premiums, over and above fancy base prices, were bid for prompt shipment of steel.

At the present time the cost of producing steel is abnormally high because the demand is so very light. In calling the production cost abnormally high it is meant that if mill-working conditions now, as to tonnage relative to capacity, were the same as in 1897 and 1898, with full allowance for increased rates of wages, freight rates and prices of supplies, but with the advantage of improvements that have been introduced, the cost of making steel would be much lower than is being shown by the cost sheets.

The extra cost at the present time is not due entirely to poor distribution of overhead, though that is obviously an important factor. Bond interest to be paid by 15,000 or 25,000 tons a month instead of by 100,000 tons falls very heavily per ton, but that might be taken care of. It is not necessarily unbusinesslike to spread fixed charges over periods of time. There is much more in the high costs of today than that, for various items of operating expense are heavy per ton, when they would disappear entirely if the plant were idle. In particular, the labor cost with the present low operating rates is exceptionally high. It is not a matter

of wage rates per hour, but of the number of man-hours per tons of output. A plant producing at 25 per cent of capacity has much more than 25 per cent of a full payroll.

Last year relief from high costs might have been proposed by making buyers wait their turn, giving the buyers only the steel that could be produced economically. The buyers, however, refused to wait. They needed the steel just then, and some of them doubted very much whether they would need steel later. The mills probably agreed with this view, though they had no occasion to say so.

As for relief at present, making stocks of steel against possible requirements in future is out of the question. As a rule the product could not be stocked advantageously and economically, and buyers' specifications vary, steel being usually rolled to order. Relief might be suggested in the form of some mills closing entirely and others running at fair rates, but that would increase the hardships of the workmen and the idea is rejected on that basis.

The philosophy of the steel trade therefore is that it has nothing to do but peg along and make the best of the situation. In its present depth the depression cannot last long, it is argued, for the country is certainly using and wearing out steel at a greater rate than the present production of steel, so that some sort of reaction must come soon.

American Leather

Chemists Association

IN VIEW of the chemical and physical complexity of materials as well as reactions involved in the production of leather, it is not strange that the development of analytical methods has occupied a very considerable portion of the chemist's attention in this field. The earlier independent workers were confronted with strange inconsistencies when attempts were made to interchange methods and compare data. Quite naturally this led to the formation of groups of chemists in different countries for the purpose of standardizing analytical methods. A brief outline of this evolution as it took place in America may be of interest in connection with the report of the eighteenth annual meeting of the American Leather Chemists Association which will be found elsewhere in this issue.

In attempting to determine the tannin content of certain foreign tanning materials which were exhibited at the Columbian Exposition at Chicago in 1893, WILLIAM H. KRUG became strongly impressed with the need for a uniform method of analysis. The desirability of close co-operation was evident and after considerable discussion the Association of American Leather Trades Chemists was organized in Chicago, Oct. 30, 1893. At the next meeting, which was held in conjunction with that of the Association of Official Agricultural Chemists on Aug. 23, 1894, at Washington, it was decided to become a section of the latter organization. For a time this arrangement was satisfactory, but gradually it became apparent that the interests of the two groups were drifting apart. Accordingly a small group of leather chemists who had been active in the work of the tannin section of the A.O.A.C. met Nov. 3, 1903, and formed the American Leather Chemists Association, which, however, did not assume independent existence until the fall of 1905. At this time the council authorized the publication of a monthly journal and appointed W. H. TEAS editor. The first

issue appeared in January, 1906. The subsequent development of the association was marked by steady growth and broadened interests, and at present it has over five hundred members.

Of necessity, much of the research work done has been of a routine analytical character and many of the methods developed are empirical in nature, requiring strict adherence to the minutest details of manipulation in order to obtain concordant results. Even today, in spite of years of experiment, there is no satisfactory direct method for the determination of tannin. These difficulties are due in large measure to the complex chemical and physical nature of the materials, and it is becoming increasingly evident that their solution will require intensive application of physicochemical principles, colloid chemistry being included within the meaning of this term. Prof. H. N. HOLMES' brilliant address on colloids should be particularly effective in stimulating appreciation of this fundamental subject.

The chemist's first efforts in this industry were looked upon with mistrust by the practical tanner, and it would seem that even at the present time there is in many cases an unnecessarily wide gap between the chemist and the tanner. Thus it was somewhat of a surprise to learn at the recent convention that this was the first time that Tanners' Council had extended a wish for a successful meeting. However, this feeling of astonishment was tempered somewhat by the remarks of L. J. ROBERTSON, vice-president of Tanners' Council, who spoke most highly of the work done by the chemists in the leather industry and suggested consideration of a plan whereby members of Tanner's Council would receive copies of the journal of the association.

Although the leather chemists can point with considerable pride to past accomplishments, they show no disposition to rest on laurels already gained and their attitude is rather one of eagerness to push forward into the vast unexplored regions upon which their feet have just begun to tread.

Easy Money From Work

SOME time ago we published an article entitled "Easy Money From Peat." All you had to do was to buy stock and wait for the returns. The investors are still waiting, but so long as they have abundant faith they can enjoy themselves. There is another source of easy money, for detailed information of which we are indebted to the Boston *Herald*. That newspaper published a series of editorials on the building situation in the Hub, and these have been collected and republished in the form of a little book. It tells us how to make good money by joining building trades unions.

For instance in the regulations of the Plumbers' Union of Boston Article 9 reads: "It shall be the duty of all foremen to report any man late on his job to his employer at the time it occurs." That sounds all right, but in labor circles there seems to have entered a quality of talmudic scholarship that qualifies rules, giving them new and unexpected meanings. Another rule requires that all foremen shall be union men and Article 9 has been construed to indicate that a foreman may not report a workman for delinquency in any other respect than tardiness. In the Painters and Decorators' Union it is said that a foreman is restricted from commenting on whether a man is doing a proper or an inadequate measure of work.

In the Plasterers' Union there is a rule that, no matter how many men may be employed in a shop, no more than three apprentices may learn the trade in it. Article 14 in the local Plumbers' Union reads: "It is expressly understood that no employer will be entitled to more than two apprentices."

Among bricklayers it was discovered that apprentices could not be employed unless they were the sons of members of the union engaged on the job. The plasterers have a rule which requires them, when traveling to and from work out of town, to take the train nearest 8 in the morning, and 5 in the evening.

If you can crank a Ford car you can operate a gasoline diaphragm pump, and if you can operate a gasoline diaphragm pump and the union admits it and gives you a card, you are an "engineer." Time was when the water boy who carried kettles of water or beer to the men working on a job used to run half a dozen of them with ease. It wasn't supposed to be skilled work. But now it is, and an "engineer" runs a single pump, getting \$10 a day for starting it in the morning, pouring a little oil on it occasionally, and stopping it at night. If he doesn't have to stop the pump at noon and start it up again at 1 o'clock, but can just let it run, then he gets overtime pay for the noon hour.

An instance is given of a building operation in the Back Bay district in which an automatic electrically-driven pump with float control was installed. It was placed in a wooden shack, under lock and key. The union declared that it must be under the constant supervision of an "engineer" and the easy work of sitting outside the shack cost the builders \$168 a week.

A hoisting engine needed repairs. The regular engineer was asked to perform the work over Saturday afternoon and Sunday. He refused. The work had to be done and the employer obtained outside men to do it. But the regular engineer received double time for the work done by the outside machinists, even though he refused to do it himself, for the union held that the work "belonged" to the union man.

To build a brick wall cost last year ten times as much as it did a few years ago. The pay of masons was doubled, the work per day per man was cut down from 2,000 bricks a day to 500, and owing to shortage of masons, builders had to bid up from \$1 to \$1.35 an hour. It was brought out that the mason who picks up a brick and places it in a wall receives as much as the manufacturer does for the same brick, for excavating the clay, molding it, burning it, handling and storing it and all the risk and charges of doing business.

No brush over 4½ in. in width may be handled by a member of the Painters' Union, and sprayers are forbidden.

These are a few, only a very few, of the ways of getting easy money from work brought out in the Boston *Herald* book. We do not offer them as arguments against union labor as an institution. We mention them as sequelæ of a theory to which we lately referred, that opportunity is property. If opportunity is property, we might as well face the fact, and organize our institutions to meet it. The Declaration of Independence claims that every man is entitled to life, liberty and the pursuit of happiness. Such title involves the freedom of opportunity, and this has been our theory of government and of conduct. It has ceased to be our practice in the building trades and, indeed, in many other unionized occupations.

Industrial Alcohol and Prohibition Enforcement

Chemical Industries Protest Against the Volstead Supplemental Prohibition Bill—Lawful Uses of Industrial Alcohol Are Defended—Provisions of Existing Law Are Declared Adequate, but Its Administration and Enforcement Are Denounced

THE Volstead supplementary prohibition bill was vigorously opposed at a protest meeting of the New York Section of the American Chemical Society, held at the Chemists' Club on June 10. The general interest in the subject and the fact that this was the last meeting before the summer intermission were responsible for an unusually large attendance. In the course of his introductory remarks the chairman, Dr. John E. Teeple, said: "I wish to make it perfectly clear that we are not here to discuss prohibition, its advantages or its disadvantages. This is a matter of private opinion and not a subject for action by this organization of chemists. We are not here to discuss the desirability of enforcing the prohibition enforcement act or any other act on the statute books. But the prohibition enforcement act clearly distinguishes between alcohol for industrial use and alcohol for beverage use. We are vitally interested in the first form of alcohol, and as a society are not at all interested in the second form.

ATTITUDE OF THE ANTI-SALOON LEAGUE

"The enforcement act instructs the commissioner to prevent the use of alcohol as a beverage. This is accordingly his duty. But just as definitely and clearly it instructs him to insure an ample supply of alcohol and promote its use in scientific research, and in the development of fuel, dye and other lawful industries. Consequently this is also a lawful duty of the commissioner. If the commissioner attempts to carry out his proper function in both cases, he will of course at times meet difficulties, and will probably develop a tendency to lean toward one duty at the expense of the other in order to avoid these difficulties. The Anti-Saloon League propagandists can see only prohibition in the law or in the duty of the commissioner. The chemist sees another duty which is just as important and just as much a matter of law; that is the duty of promoting the use of alcohol in the industries.

"I have received a very courteous letter from Wayne B. Wheeler, general counsel of the Anti-Saloon League, in which he states that the announcement of our meeting gives him the impression that some of our members have been misled concerning the provisions of the pending supplemental enforcement bill and that many of those who spoke against the bill in its original form were unduly alarmed about the possible effects of it. The bitter experiences of legitimate chemical firms of long standing who have occasion to use alcohol for legitimate purposes are a matter of record. Some of these experiences and difficulties will be related to you tonight. A little careful thought will indicate that these people, with a continued history of unnecessary interference with their business still fresh in their minds, are not likely either to be misled or to be unduly alarmed. They know what is happening and what will result from the present trend. They have reason to see

this situation much more clearly than Mr. Wheeler could possibly see it, and at this meeting tonight the various speakers want to give you a clear picture of the situation as it exists."

The first paper to be presented was that of Dr. Martin H. Ittner, chairman of the industrial alcohol committee of the American Chemical Society.

Report of the Committee on Industrial Alcohol

BY MARTIN HILL ITTNER

At the spring meeting of the American Chemical Society in Rochester, Dr. Raymond F. Bacon called attention of the society to the danger threatening the industries of the country if prohibition enforcement legislation is allowed to become enacted without properly providing for the unhampered use of industrial alcohol. A committee on industrial alcohol was appointed to study the subject and represent the society, if need be, before legislative bodies on matters pertaining to alcohol on which there was practically a unanimity of opinion within the society.

The bill, H. R. 5033,¹ which was recently introduced in Congress to amend the national prohibition act, contains features which are unquestionably seriously objectionable to many industries, and the committee on industrial alcohol requested a hearing before the Committee on the Judiciary of the House of Representatives. This request was finally granted and the alcohol committee presented the resolutions of the American Chemical Society and a few specific suggestions for the modification of some of the more objectionable provisions in H. R. 5033.

The resolutions of the American Chemical Society are as follows:

Whereas the use of alcohol in many important industries is absolutely necessary not only to the continuance of such industries but also for the manufacture of articles needed by other industries and even for the production of articles necessary to the protection of, and sustenance of life itself, and

Whereas it is the policy expressed in the national prohibition act to encourage the use of industrial alcohol for non-beverage purposes, such as the manufacture of thousands of necessary medicinals, and countless dyes, chemicals and perfumes, and for the production of heat, light and power.

Be it Resolved, That the American Chemical Society advises, and most strongly urges, for the national welfare, that all legislation for the enforcement of prohibition be so clearly drawn as not to restrict the activities of legitimate industries which must have industrial alcohol, and that all such legislation be so drawn as to provide in specific sections for the encouragement of the proper use of alcohol in the industries.

LIMITS THE SUPPLY AND USE OF ALCOHOL

For the benefit of those who are not familiar with bill H. R. 5033, I will say that its ostensible purpose is to control and prohibit the use of beer and light

¹EDITOR'S NOTE: H. R. 5033, referred to here, was subsequently amended and reported June 2, 1921, as H. R. 6752. See CHEM. & MET. ENG., vol. 24, p. 1076, June 15, 1921.

wines for medicinal purposes, but instead of confining itself to this, as it might have done, it does not even mention beer, but goes on to limit the supply and use of alcohol.

It would not allow any pure alcohol to some of the important industries unless the manufacturer, in each case, could clearly establish to the satisfaction of the commissioner that it would substantially interfere with his manufacture if he used a medicated or compounded alcohol. The burden of proof is put on the manufacturer. He is denied the alcohol at the outset and he *may* get it if he is lucky enough to convince the commissioner. If a manufacturer makes a hundred different articles with the use of alcohol, and some of them make more than that, it will be necessary, in the case of each article, to present a separate argument or the use of pure alcohol will be denied for the manufacture of that article. Respectable, long-established manufacturers are even now subject to frequent and unnecessary delays and hold-ups on their supply of alcohol, and this new bill, if enacted as introduced, would bring about an intolerable condition.

After making it obligatory to "medicate or compound" alcohol, to use the language of the bill, or to denature it, in plain English, a "joker" is introduced which reads, "Liquor, including alcohol, so medicated or compounded shall not be exempted from any tax to which liquor is subject," thereby greatly restricting the use of tax-free denatured alcohol in some of the important industries.

The first glaring defect in the bill, as introduced, to which the committee on industrial alcohol called attention was the power conferred on the commissioner to restrict the supply and uses of alcohol. In the first part of section 2 the bill apparently permits the manufacture of alcohol without restriction as to quantity, but further along in the same section the commissioner is told that he *shall* limit the supply and use of all liquors, *not* excluding alcohol. If he is directed to limit the supply of alcohol, he must necessarily restrict manufacture. He is directed to limit the supply "to the actual needs for non-beverage uses." No commissioner can know the actual needs and he is almost sure to restrict the supply of alcohol so that it will be insufficient.

AMENDMENTS PROPOSED BY COMMITTEE

The committee proposed an amendment by introducing the words "save alcohol" after "all liquors," line 11, page 2, section 2, so that it would read as amended: "The commissioner shall limit the supply and use of all liquors, save alcohol, to the actual needs for non-beverage uses," etc. It ought to be perfectly evident that the commissioner should not be allowed to restrict the supply and use of alcohol. For instance, he should not be permitted to restrict the supply of denatured alcohol, but if he limited the supply of pure alcohol in accord with his guess as to the actual needs, he would thereby restrict the supply of denatured alcohol; for you cannot have an adequate supply of denatured alcohol if you limit the supply of pure alcohol, as denatured alcohol is made from pure alcohol. The supply and uses of pure alcohol as such for industrial purposes should not be subject to the absolute control of one man.

Section 3 of the bill contains even more objectionable blows at industry. As I have already explained, the

bill seeks to force manufacturers to use "medicated or compound alcohol," or, in plain English, *denatured* alcohol, in the manufacture of all articles, and then after this thrust at industry gives the bayonet a final vicious twist by providing that "alcohol so medicated or compounded shall not be exempted from any tax to which liquor is subject."

To meet these objectionable parts of the bill, the committee on industrial alcohol offered an amendment to section 3, cutting out the most objectionable parts and adding an amendment that would not only encourage the proper use of alcohol in the industries but would also tend to prevent much of the diversion of alcohol to unlawful purposes. Section 3, with the amendment proposed would read:

No other intoxicating liquor than alcohol shall be used in the manufacture of any article enumerated in subdivisions b, c, d, and e of section 4, title 2, of the national prohibition act unless it shall clearly appear to the satisfaction of the commissioner that without considering palatability the use of some other intoxicating liquor than alcohol is essential as a component part of such article; and *in furtherance of the provisions of title 3 of the national prohibition act, tax-free alcohol suitably and lawfully denatured may, under regulations, be used in the manufacture of any such article.*

USE OF TAX-FREE DENATURED ALCOHOL

Your committee after careful consideration decided they could not take any other ground. If a manufacturer in legitimate business, and we are not considering any other at present, finds that he must have pure alcohol in his work, let him have it under suitable regulations and he will pay the tax that is due on pure alcohol. If he can gradually find suitable denaturants so that in the manufacture of some of his articles he can use alcohol denatured in one way or another, but all unfit for use for beverage purposes, he should then be allowed to use such alcohol tax free. The Government should not hinder him, but should co-operate with the manufacturer in finding new opportunities for the use of denatured alcohols. Each article so made which was previously made with tax-paid alcohol lessens the possibility of alcohol being diverted to beverage purposes. There is no more reason why denatured alcohols used under regulation should be taxed than that coal should be taxed, and there is no reason why any legitimate industry should be denied the use of tax-free denatured alcohol.

OTHER OBJECTIONABLE PROVISIONS

The committee on industrial alcohol looks upon all of section 4 of H. R. 5033 as unnecessary and objectionable and requested that it be stricken out entirely. This section provides nothing essential to prohibition enforcement and is unnecessarily obstructive. It provides a delay of not less than twenty days to any permit to sell any liquor, including alcohol, to manufacture alcohol, or to manufacture articles from alcohol such as medicines and the like. It requires the public posting of the fact at one's place of business so that any fanatic may become informed thereof, and then provides a means whereby any fanatic may hold up such a permit and even force a man to go to court to get what the Government ought to aid him in getting at the outset. The provision referred to is as follows: "Any federal or state officer or any person authorized thereto by any such officer may oppose any such

application." It is not unreasonable to suppose that somewhere there might be found an overzealous state officer who would come under the designation of "any state officer," and it is not outside the range of possibility to assume that such a state officer might authorize all his zealous friends to oppose alcohol permits, these zealots answering the description of "any person authorized thereto by any such officer," thereby giving them the authority of law to "oppose any such application" for alcohol.

With respect to the other sections of the bill we made no recommendations, but our silence is noncommittal.

I cannot refrain from giving my impressions with regard to the hearing before the Committee on the Judiciary. At first, it was not at all certain that we would get a hearing, and the chairman evinced a desire from the start to hear as little as possible against the bill. His frequent remarks tended to divert the testimony of the speaker so that he was forced involuntarily from his intended line of argument. I wish to add that some of the members of the committee impressed one as being both intelligent and fair, but it is doubtful whether many of them realize the injury that legislation of this kind would do industry.

IMPORTANCE OF INDUSTRIAL ALCOHOL

The future prosperity of the country hangs in the balance as much now as it did during the war; more perhaps, for then with an outside objective we presented a united front and worked together, but now, with war out of the way, we are already beginning to forget the necessities of yesterday, unmindful of what the morrow will bring forth. In war time we were absolutely dependent upon industrial alcohol and on our industries. The same is just as true in times of peace, and we are courting disaster when we encourage obstructive legislation.

A year and a half ago all manufacture was going full speed. Now many lines of business are in a bad slump. Though economic conditions, like foreign exchange and war-inflated prices, not the least of which is labor, are responsible for much of the business depression, a greater factor is the uncertainty that we have to face in legislative matters. With Congress continuously mindful of the needs of American industries we cannot help but prosper. We have faith that they see the need of adequate protection against attacks from without, but let us hope that they will also protect us from the dangers that arise within, like those in H. R. 5033.

Industrial Alcohol and Its Relation to Prohibition Enforcement From the Manufacturers' Standpoint*

BY M. C. WHITAKER

The chemical profession has cause to be concerned over the present and future status of alcohol for legitimate industrial and scientific purposes. Chemists may well ask such questions as: Why am I unable to get alcohol to continue the manufacture of U.S.P. medicinals, antiseptics, flavoring extracts, perfumes and the infinite variety of daily household necessities requiring pure alcohol in their production? Why is it

so difficult for me to get alcohol for scientific use for research and for educational purposes? Why do I have to pay a tax of 1,000 per cent on alcohol used in my industry when we have a fifteen-year old law giving us tax-free alcohol for industrial purposes? What has the prohibition of intoxicating liquors got to do with alcohol for industrial uses and for purposes of national defense?

Let us first clarify our problem, and then possibly suggest remedial measures. The national prohibition (Volstead) act was passed with three principal divisions, or titles: Title I. To provide for the enforcement of war prohibition (automatically replaced by the second section—which became operative on Jan. 16, 1920, the effective date of the Eighteenth Amendment); Title II. Prohibition of intoxicating beverages; and Title III. Industrial alcohol.

Alcohol is defined in the prohibition section of the act as follows:

The word "liquor," or the phrase "intoxicating liquor," shall be construed to include alcohol, brandy, whiskey, rum, gin, beer, ale, porter and wine, and in addition thereto any spirituous, vinous, malt or fermented liquors, liquids and compounds, whether medicated, proprietary, patented or not, and by whatever name called, containing one-half of one per cent or more of alcohol by volume, and which are fit for use for beverage purposes.

The same alcohol is defined in the industrial alcohol section of the same act as

The term alcohol means that substance known as ethyl alcohol, hydrated oxide of ethyl, spirit of wine, from whatever source or whatever process produced.

Thus it is, at the very outset of our problem, that law has combined with nature to give a Dr. Jekyll and Mr. Hyde character to one of our greatest chemicals, alcohol.

In the administration of this law, when there is an apparent conflict of language, the prohibition officers appear to work under the injunction usually given to beginners learning to drive an automobile: "When in doubt, push both feet." Prohibition is regarded by them as their first duty, and when in doubt, "stop everything—engine and all."

LEGAL INTERPRETATIONS OF PROHIBITION

Narrow rulings under these provisions have led to such ridiculous interpretations as may be illustrated by the following instances:

(1) The general counsels of the telephone company in both Boston and Baltimore advised their clients that the listing of the name "U. S. Industrial Alcohol Co." in the directory would be an illegal act under the prohibition law. The company was obliged to obtain an official ruling from Washington in order that its corporate title might be listed in telephone books.

(2) The prohibition commissioner, under date of March 22, 1921, advised the U. S. Industrial Alcohol Co. that the use of the words "Cologne Spirits and Alcohol, Pure and Denatured" on their letter heads (standardized for fifteen years) was illegal under the prohibition act, and must be stopped. As result of an appeal to the solicitor of the Internal Revenue Department, this ruling was finally reversed under date of May 12.

(3) E. B. Badger & Sons, of Boston, attempted to purchase a copy of "Young's Fractional Distillation" from a local book store, and were advised by a clerk

*Dr. Whitaker was prevented from attending the meeting because of his father's death, and his paper, which is printed here in abstracted form, was read by the chairman, Dr. Teeple.

that they had the book, but that it could not be sold under the prohibition law. On May 6, 1921, the following letter, signed by John F. Kramer, prohibition commissioner, was directed to the firm:

Gentlemen: Replying to your letter of April 29, 1921, you are informed that if "Young's Fractional Distillation" is a scientific publication which is commonly used by scientists, this office perceives no reason why it should not be purchased by you for the use of your engineering department.

This office issues no permits to enable scientific persons to procure such technical works, but it is anticipated that this letter exhibited to any bookseller who has such a work for sale will serve the purpose.

(4) On May 15, 1920, the U. S. Industrial Chemical Co. of Baltimore delivered to the steamship piers thirty-two drums of iso-butyl alcohol for export to France. The ship's agent refused to accept the goods, because he noted the word "alcohol" on the package and in the bill of lading, stating that they were not permitted under the prohibition laws to handle alcohol.

The goods had to be reloaded, trucked back to the plant, a round trip distance of twelve miles, relabeled and new bills of lading prepared under the name "iso-butyl solvent." Under this name the steamship company accepted the consignment and the reason for the disguise had to be explained to the French buyers as well as such a thing can be explained to a chemist of a sister republic.

(5) The Bishop Gutta Percha Co. applied for a permit to use tax-free alcohol in its laboratories. The answer to the application, under date of May 6, contains the following paragraphs:

This permit is granted on condition that the permittee agrees to keep on hand a stock of tax-paid alcohol for the routine work of the laboratory and that the tax-free alcohol withdrawn under this permit will be used only for original research and development work. When the research work has been developed into an actual working process and the function of the laboratory is merely to continue the operation of this process, tax-free alcohol may not be used.

Routine work such as tests or analyses for purity of various materials both during the process of manufacture and in determining the purity of the finished product does not appear to be exclusively scientific research, and tax-paid alcohol should be used for such purpose.

ATTITUDE OF PROHIBITION ADVOCATES

Wayne B. Wheeler, general counsel of the Anti-Saloon League, made, before the Judiciary Committee, on Friday, May 20, the following very significant statement: "If it comes to the point where it must be a choice between medicaments for medical preparations and the enforcement of the law, I think we must choose law enforcement." Likewise C. R. O'Connor, until recently federal prohibition director of New York, is reported to have said, in answer to a protest by manufacturers in regard to the reluctance of his office to approve permits to obtain alcohol for their industrial operations, "Industrial alcohol be damned; you know it's all booze!" One of the greatest difficulties connected with the separation of industrial alcohol from prohibition enforcement is reflected in these two statements by high authorities in the prohibition-enforcement program. The do-or-die fanaticism reflected in Mr. Wheeler's statement and the utter lack of knowledge as to the existence of an industrial alcohol problem as reflected in Mr. O'Connor's statement represent the frame of mind of 90 per cent of the prohibition advocates.

It is a notorious fact that the Anti-Saloon League

dominates prohibition legislation and enforcement. When the prohibition law to enforce the Eighteenth Amendment was presented to the Judiciary Committee by Mr. Wheeler, it consisted of what are now Titles I and II, for the enforcement of prohibition, with absolutely no provision for industrial alcohol. What is now Title III, the industrial alcohol section of the prohibition bill, was drafted and introduced as a Government measure at the direct suggestion of the then commissioner, Daniel C. Roper, in order to save industrial alcohol. It was through the foresight and influence of the officials of the Bureau of Internal Revenue, and not due to any consideration on the part of the promoters of the Anti-Saloon League bill, that the bills presented to Congress to enforce prohibition carried any provision whatever for industrial alcohol.

The entire disregard of the right of existence of alcohol, the chemical, for industrial purposes can only be explained on the assumption that they are totally lacking in knowledge of its essential relations to chemical industry, to their home comforts, to the health of themselves and their families, to the progress of science, and to national defense. Granting this ignorance, it is not surprising that they believe and advocate, as the best method of enforcing prohibition, the complete extermination of all alcohol.

NEED FOR EDUCATIONAL CAMPAIGN

This is a condition for which the chemists, in a large measure, are responsible, and a condition which they and the industries using alcohol can and must remedy. They have not adequately educated the public, who make and enforce our laws, in the matter of the essential needs of chemical industry. To educate that public is a big contract, but it must be undertaken and successfully carried through by the chemists working individually and collectively, if alcohol and all industry directly and indirectly related to it is to be saved.

Chemists look upon alcohol as one of the most essential and important materials of their industry. They put it in the same class with sulphuric acid, benzene or caustic soda. They know there can be no great development of chemical industry without alcohol, any more than there could be a steel industry without pig iron, an electric industry without copper, or a fertilizer industry without potash and fixed nitrogen. While alcohol may not be used directly in the manufacture of textiles, automobiles or sugar, any chemist can draw a flow sheet to show its relation to some of the contributing industries.

Furthermore, petroleum experts issued a warning at the last meeting of the American Chemical Society in Rochester in regard to the visible supply of liquid fuels, which ranks in importance with the famous warning of Sir William Crooks in reference to nitrogen for fertilizer. They have pointed out that in from fifteen to twenty years the rapidly diminishing supply of petroleum will compel the world to turn to some other source for liquid fuel. The only possible solution to the problem in this distressingly short time is alcohol.

DIVISION OF INDUSTRIAL ALCOHOL CREATED

The industrial alcohol section of the national prohibition act (Title III) theoretically became effective on Oct. 28, 1919, although administrative regulations (No. 61) were not approved thereunder until Jan. 31, 1920, and Feb. 5, 1920. Laws will not administer themselves, and this is especially true of the national prohibition

act. No provision whatever was made by the Government, at the outset, to separate the administration of industrial alcohol from prohibition. All energies were arbitrarily directed, under the ceaseless pressure of the Anti-Saloon League, to organizing for and administering prohibition, while the industrial alcohol provisions of the law were literally lost in the fog.

The situation for alcohol for the industries, for research and for education became so serious that in June, 1920, a large committee representing leading educators, investigators, chemical societies, consumers and producers and the War and Navy Departments journeyed to Washington and strongly protested at the neglect of the legitimate alcohol industry in the scramble to enforce prohibition.

This protest finally resulted, in October, 1920, in the creation of the Division of Industrial Alcohol and Chemistry, under Captain D. S. Bliss, deputy prohibition commissioner, with Dr. J. M. Doran, of the Bureau of Internal Revenue, a chemist of high professional standing and long experience, in charge. This division has not had an opportunity to achieve the full measure of its importance, because it is still subordinated to the prohibition provisions of the law. A Division of Industrial Alcohol and Chemistry, directed by competent chemists equipped with adequate facilities, and charged with the full responsibility of administering all alcohol for industrial, scientific and non-beverage uses, is clearly implied when industrial alcohol was given a separate section of the law, and the legal provisions to "place the non-beverage alcohol industry and other industries using such alcohol as a chemical raw material or for other lawful purpose upon the highest possible plane of scientific and commercial efficiency" are made mandatory.

The chemical profession and the chemical industry should unite to make the Division of Industrial Alcohol and Chemistry what it is legally stated to be, and what the economic future of this country demands that it should be—an organization to control alcohol, the chemical.

NEW VOLSTEAD BILL THREATENS CHEMICAL INDUSTRIES

Let us turn our attention to the new bill now before the House, which is a further encroachment upon chemical industry. The development of industry as a whole is a matter of bread and butter to the chemist; the greater that development the more bread and the more butter will be available to those men who have chosen chemistry or the chemical industry as their profession. New legislation, of which we are threatened with a surfeit, and which threatens chemical industry, deserves the attention of all chemists.

This new bill (H.R. 6752) introduced by A. J. Volstead, chairman Committee on Judiciary, and sponsored by Wayne B. Wheeler, counsel of the Anti-Saloon League, is admittedly intended to prohibit beer, although the word "beer" is not used once in the proposed act.

For purposes of discussion, the bill may be divided into three parts: (1) The prohibition of beer, and limiting prescriptions; (2) the extension of governmental control, under the guise of prohibition, to the U.S.P. medicines, the proprietary, the perfume and the flavoring extract industries; (3) the penalties.

We as a profession are not concerned with the prohibition features of this bill. It might be fair to assume that our professional associates, the medical

men, would wince at the idea of having the judgment of a commissioner of prohibition supersede that of the 150,000 medical practitioners in the United States.

GOVERNMENT CONTROL IS EXTENDED

The proposal to include under this bill a group of industries conforming in every respect to the provisions of the Eighteenth Amendment, the national prohibition act and every other law of the land is plainly an effort to extend government control where it is neither necessary nor desirable.

Your home town laws used to require a man who proposed to open a saloon in a neighborhood to post a notice of his intention upon the doors and walls of the building, in order that the whole neighborhood might be advised of the impending stigma that was about to be placed upon it and have an opportunity to work up opposition.

Similarly, the pending bill, in the case of a manufacturer proposing to engage in the business of making pharmaceutical, proprietary, toilet and antiseptic articles or flavoring extracts, requires that "notice thereof shall be served on the Attorney General and publicly posted at applicant's place of business" . . . and further, "any federal or state officer or any person authorized thereto by any such officer may oppose any such application." Why should a legitimate chemical industry and its owners and employees be stigmatized and put in the class with the corner saloon or the bootlegger, and the clear implication held out that he is engaged or is about to engage in a business of questionable character? Why should legitimate business plans be disclosed by "notice of intention," and why should another opportunity be created, by law, for graft?

Another provision of the bill gives concurrent power to the Commissioner of Internal Revenue and to the Attorney General, and also provides that the Attorney General may designate "some suitable person or persons to have charge of and perform the duties imposed upon him by this act."

This means, in plain English, that these legitimate industries, because they require and use alcohol, will have to submit their business, their operations and their employees to control, not only by two independent Government departments, but also by an additional unknown quantity designated as "some suitable person or persons." Who do you think it or they will be? The risks of doing business under such conditions would alienate legitimate investors.

STIGMA ON CHEMICAL PROFESSION

No chemist could afford to risk a fine of \$1,000 or a jail sentence for five years for some alleged or technical violation of the law. Such provisions as these stigmatize an important division of chemical industry, and that stigma passes to the chemical profession as a whole. Successful enforcement of prohibition requires the co-operation of the chemists to a greater extent than that of any other profession, and that co-operation can not be obtained by wholly unnecessary or misdirected stigmatization.

Does the spirit of the proposed bill conform to the principle of placing "the non-beverage alcohol industry and other industries using such alcohol as a chemical raw material, or for other lawful purposes, upon the highest possible plane of scientific and commercial efficiency" as already provided in the industrial alcohol section of the existing prohibition enforcement law?

Relation of Industrial Alcohol to Pharmaceuticals, Perfumery and Flavoring Extracts

W. L. Crounse of Washington, the counsel for the National Wholesale Druggists Association and the Manufacturing Perfumers Association, told of the interesting experiences of these industries with prohibition enforcement. Former Prohibition Commissioner Kramer was quoted as authority for the statement that of 75,000 permits issued during the first year of prohibition, 12,000 at least were issued to persons who had never before been engaged in any line of industry in which alcohol was used. Over 4,000 of these were issued in New York City alone, and it can be safely estimated, according to Mr. Crounse, that five of every six of these were used illegitimately. "These fly-by-night concerns either diverted their alcohol to beverage purposes without pretending to manufacture a legitimate product, or mixed it with some bland essential oil, a little coloring matter and a small amount of sugar, and 'bootlegged' it through low-grade barber shops under 'hair tonic,' 'face lotion' or similar labels."

One of the most demoralizing phases of prohibition enforcement, according to Mr. Crounse, has been the character of the organization charged with its administration. Protests of honest dealers and manufacturers have often been unheeded by prohibition directors, but "intimations were frequently received to the effect that if anyone who had difficulty in obtaining a permit would apply to certain ex-officials of the prohibition unit, relief would be speedily forthcoming." A number of illustrations were cited to show the graft and criminal laxity on the part of enforcement officials.

PERFUMERS FORCED TO SUPPLY FORMULAS

Many difficulties have been experienced by the legitimate perfumers and manufacturers of toilet articles.

One of the best-known manufacturers of toilet goods in the country was called upon by the local prohibition director for the complete formulas by which his goods were manufactured. As the existing regulations did not require such data to be submitted, the manufacturer was very reluctant to comply with the director's demand, but finally submitted quantitative formulas. A fortnight later he was greatly surprised at receiving a second demand for the same data and upon investigation learned that all the formulas originally submitted had disappeared from the director's files. These formulas have never been recovered."

FLAVORING EXTRACT MANUFACTURERS PROTEST

F. M. Boyles of Baltimore stated that the Flavoring Extract Manufacturers' Association was unalterably opposed to the additional restrictions on lawful industry such as would be imposed by the enactment of the Volstead supplemental prohibition bill. Sections 3, 4 and 5 were declared to be the most objectionable to the food industries.

"The first sentence of section 3 gives the prohibition commissioner the arbitrary power to grant only such permits as are necessary to supply the actual needs for non-beverage purposes, and to limit the supply and use of all liquor save denatured alcohol and denatured rum unfit for internal use to such non-beverage needs. This is an entirely unnecessary provision, because the Volstead act itself determines that there is no use or need for alcohol save for non-beverage purposes.

"In section 4 we manufacturers are classed with the corner saloonkeeper, and required to post publicly in our

places of business notice that we have applied to the prohibition commissioner for a permit to use alcohol in our business, and anyone in the community who may have a personal grudge against us or any federal or state officer who is looking for graft can oppose our application. We object to notifying anybody how, when or where we purpose to use alcohol.

"Section 5 gives concurrent authority to the Attorney General and to the prohibition commissioner to suspend or cancel a permit. The result of this would be to subject the manufacturer to the decisions of two tribunals instead of one. In decisions pertaining to business, we believe that only one department of the Government should have such authority."

LEGAL STATUS OF INDUSTRIAL ALCOHOL EXPLAINED

The concluding speaker, Alfred D. Van Buren, general counsel of the legal division of the Bureau of Internal Revenue, was introduced by the chairman as one of the Government officials who has been most helpful to the legitimate users of alcohol. In referring to the legal status of industrial alcohol, Mr. Van Buren said:

"Industrial alcohol is absolutely no different, whether it is the pure alcohol designated in the definition of Title I as a liquor, or whether it is used industrially and chemically under Title III. It is the same product which Congress has classified within the term of "intoxicating liquor," but bear in mind that the Eighteenth Amendment was simply for the prohibition of intoxicating liquor for beverage purposes.

"Congress recognized the fact that there was a legitimate use and value for all liquor, and consequently provided for the non-beverage use of liquors, including alcohol. The non-beverage industry is a general or descriptive term, but the industrial use of alcohol, and the use of alcohol as a chemical is, without the slightest doubt, a non-beverage use. It is therefore not prohibited by federal amendment nor by the national prohibition act.

"Alcohol as booze or liquor has no legal status, but alcohol as a chemical has a legal status which must not be disturbed, but on the contrary, promoted and encouraged."

The proper extension of the policy of denaturation was emphasized by the speaker as one of the ways in which the chemist can increase the usefulness of alcohol without coming into conflict with the operations of the prohibition act.

"The only thing that stands in the way of the open door for denatured alcohol is the question of taxes. I have tried to explain that the tax on intoxicating liquors was for the purpose of collecting revenue and for stamping out a malicious commodity. If, therefore, by denaturation you can destroy the intoxicating character of alcohol as a liquor, you are certainly solving one of the great problems of prohibition, for the records at Washington show that 90 per cent of the alleged liquor seized consisted of diverted alcohol, or alcohol which has been converted into spurious liquor and medicinal compounds.

"I believe that if prohibition, as incorporated in the Eighteenth Amendment of the Constitution, was again submitted to the people, it would carry overwhelmingly; but I do not believe that this prohibition contemplates or means that the legitimate non-beverage industry, represented by industrial alcohol or by the use of alcohol as a chemical, was ever intended to be disturbed by the people of this country."

American Leather Chemists Association, Atlantic City Meeting

Committee Reports—South America and the Leather Industry—Synthetic Tanning Materials—Explosiveness of Tannery Dusts—Chestnut Wood Tannin—Conditions in Leather Industry—Colloids—Tanning Materials in the Far East

THE eighteenth annual meeting of the American Leather Chemists Association was held at the Hotel Ambassador, Atlantic City, June 9, 10, and 11. Over one hundred members attended and many took active part in the discussions which followed the presentation of papers. In the following report no attempt has been made to cover any of the papers in detail, since they have been or will be published in full in the journal of the association.

OPENING REMARKS

In opening the meeting the president, F. H. Small, reviewed the work of the association during the year. In order to relieve the financial condition of the society it became necessary to increase both dues and advertising rates in the journal. The results of this step have been most encouraging, as only thirty members have resigned since the dues were increased and only seventeen of these gave the increase as the specific reason for resignation. The May, 1921, journal shows an increase of 50 per cent in amount of advertising compared with the May, 1920, issue in spite of the higher rates.

Turning to the subject of research, Mr. Small pointed out that the association was built upon committee work which is research directed toward the establishment of uniform control methods. That the British and German organizations of leather chemists are working with renewed vigor is evident from a perusal of their respective journals. During the year the American Leather Research Laboratory, which had been maintained at New York under the auspices of the Tanners' Council for the past three years, was removed to the University of Cincinnati and placed in charge of George D. McLaughlin, a well known-member of the association.

While the year had presented many unusual problems to the leather chemist Mr. Small expressed the opinion that the tide had turned and that the day of wasteful and extravagant production had passed.

In his report as secretary-treasurer, H. C. Reed stated that on June 1, 1921, the association had 177 active, 230 associate and 99 mutual members—a total of 506.

EFFECT OF HUMIDITY ON MOISTURE DETERMINATIONS

F. P. Veitch read a paper by T. D. Jarrell on "The Effect of Atmospheric Humidity on the Determination of Moisture in Leather." These experiments were undertaken in an effort to account for the difficulty of checking moisture determinations. Analyses carried out at one constant relative humidity were compared with those made at another humidity. It was found that drying at a lower relative humidity gave consistently higher results. As an example, the average of four determinations of total solids in a chestnut wood extract was 93.09 per cent at 65 per cent relative humidity and 93.60 per cent at 30 per cent relative humidity.

SOAKING AND LIMING HIDES

C. M. Morrison treated the subject of soaking and liming hides in a most instructive and interesting manner. He discussed the problems which confront the tannery superintendent and gave practical suggestions for the successful conduct of these important steps in the preparation of hides for tanning.

SOUTH AMERICA AND THE LEATHER INDUSTRY

Personal observations formed the basis of G. A. Kerr's paper on "The Relation of South America to the Leather Industry." In order to avoid the possibility of drawing erroneous conclusions from abnormal war conditions, the review was based rather on pre-war figures.

Hides and Skins. Of the eleven South American countries, nine raise cattle and export hides and skins. As a hide producer Argentina takes first place in the world. The establishment of the frozen meat industry in 1877 gave a great impetus to cattle raising, Argentina being the first country to ship frozen beef. In 1913 Argentina had 29,000,000 cattle with an annual volume of 4,000,000 hides available for export, two-thirds green salted and one-third dry. During recent years foot-and-mouth disease and anthrax have become prevalent. Argentina also had 80,000,000 sheep in 1913, these being raised primarily for their wool.

Brazil ranks next, although progress will probably be slower owing to the difficulty of securing suitable

grazing land and to the presence of ticks. It is claimed that there are 37,000,000 cattle, but as the population is 27,000,000 (compared with Argentina's 9,000,000) only 2,500,000 hides are available annually for export.

Uruguay resembles Argentina, although developments are naturally on a smaller scale. There are about 7,750,000 cattle and 11,000,000 sheep.

The other countries figure less prominently in the world's leather market, but the total from all of South America is about 15 per cent of the world's consumption of hides.

Tanning Materials. Argentina, Paraguay, Venezuela and Colombia are important producers of tanning materials. Here again Argentina leads with twelve plants having a capacity of 125,000 metric tons of solid quebracho extract. Paraguay has five plants with a capacity of 50,000 metric tons. Owing to labor conditions the maximum capacity has never been attained. Thus in 1914 exports of quebracho extract amounted to 80,000 tons from Argentina and 11,000 tons from Paraguay. The quebracho forests, which were described by Mr. Kerr in the April issue of the journal of the association, are ample for seventy-five years. In Brazil the industry is still undeveloped, but the other countries seem to be able to meet domestic requirements.

Leather. Almost every town has a little tannery, although the demand for leather is not very great, since two-thirds of the population never wear shoes. Not over \$10,000,000 gold is spent abroad annually for leather goods. Although workers have become unionized and wages have increased, the greater part of the demand will be met from domestic manufacture. The development of any extensive industry would require outside capital, which will not be readily available until government and finance are stabilized and export duties abolished.

SAMPLING AND PREPARATION OF LEATHER FOR ANALYSIS

Results of an exhaustive study of sampling and preparation of leather for analysis were given by F. H. Small. Sides of leather were divided into sections and each section was analyzed for hide substance. As would be expected, the sections near the tail gave higher figures than those near the belly and shoulder. A careful examination of these results showed that it was possible to get two or at the most three samples, each 2 x 8 in., which would be representative of the standard cuts of leather such as backs, bellies, bends, sides, and shoulders. A chart was prepared giving the relative location of the samples to be taken for each cut.

SYNTHETIC TANNING EXTRACTS

Some points to be considered in the application of synthetic tanning extracts were discussed by J. B. Hill and G. W. Merryman. The time of tanning can be reduced by the use of more concentrated baths only if the rate of diffusion can be increased. This result may be obtained in many cases through the application of syn-tans. For success the hydrogen-ion concentration must be controlled and the quality of the syn-tan must be high and uniform. There are two classes of syn-tans, those which act as real tans and may be used alone, and those which must be used with other tans. Neradol D and the cresolsulphonic acid-formaldehyde condensation products belong to the first class, although it is better to use them in conjunction with vegetable tanning materials. When applied in this way, they act as accelerators or drivers for the

vegetable tans, produce a tougher leather with a smoother grain, contribute to the tanning action and exert a clarifying influence on the extract and a bleaching effect on the leather.

Syn-tans may also be used as deliming and plumping agents in the preparation of hides.

For sole leather, syn-tans may be added at several points in the process: In deliming, directly in the rockers, in the retaining wheel, with the bleach or filler, in the oil wheel or with the dope.

In discussing the paper C. R. Oberfell suggested that the antiseptic action of these materials might cause sterilization all through the yard. He also stated that experiments led him to believe that the sulphonic acids had no plumping action when freed from excess sulphuric acid. This contention was disputed by Dr. Hill.

EXPLOSIVENESS OF TANNERY DUSTS

Attracted by the grain-dust explosion investigations in progress at the Bureau of Chemistry, Ralph W. Frey had tests made of the explosiveness of tannery dusts. Those examined were found to explode vigorously when suspended in air and it was planned to demonstrate this property to the members of the association. Unfortunately the conditions prevailing in the convention room made this impossible. In view of recent disastrous explosions in the finishing department of an aluminum ware plant and in pulverizing hard rubber, Mr. Frey thought it wise to direct attention to the possibility of similar explosions in tanneries unless proper precautions are taken¹.

EXTRACTION OF LEATHER

The committee report by John Arthur Wilson on "The Determination in Leather of Matter Extractable by Water" was published in the May journal of the association, and in Mr. Wilson's absence the conclusions and discussions were read by G. W. Schultz.

The subject was also considered by F. P. Veitch and R. W. Frey, battery extractors of the Soxhlet type being used. The effect of repeated extractions at various temperatures was studied. In no case was an absolute end point obtained, although after the second or third period the amount extracted settles to a low, fairly constant value. This may be due to the presence of some slightly soluble substance, or to hydrolysis, but it is not due to the decomposition of hide substance or collagen.

OBSERVATIONS ON WILSON-KERN METHOD OF TANNIN ANALYSIS

Further observations on the Wilson-Kern method of tannin analysis² were made by G. W. Schultz. As a result of several sets of experiments, Mr. Schultz maintains that while the official method may not be fully accurate, the error is not large and is lower than the true value, rather than higher as indicated by the Wilson-Kern figures.

CHESTNUT WOOD TANNIN

The characteristics of chestnut wood tannin were outlined by R. W. Griffith. The function of tannin in plant physiology is but little understood. Tannin is obtained

¹See CHEM. & MET. ENG., vol. 23, No. 19, pp. 915-920, Nov. 10, 1920; vol. 24, No. 1, pp. 29-32, Jan. 5, 1921; vol. 24, No. 11, pp. 473-475, March 16, 1921; vol. 24, No. 17, pp. 737-740, April 27, 1921.

²See J. Ind. Eng. Chem., 1920, vol. 12, p. 465; J. Amer. Leather Chem. Assoc., 1920, vol. 15, p. 64; CHEM. & MET. ENG., vol. 23, p. 613, Sept. 29, 1920.

commercially from practically every part of the plant—roots, bark, wood, leaves and fruit. In chestnut wood the tannin exists in the pores or ducts which separate the fibers. It is present probably as a glucoside and the percentage of glucose is quite characteristic of this material. The glucose is not absorbed by the hide powder and is included under non-tannins in the analysis. Nevertheless it supplies acetic acid by fermentation during tanning and should thus be considered as a valuable constituent of the extract. It might also be possible to convert the glucose into lactic acid, which would be of even more value in the bath.

CONDITIONS IN THE LEATHER INDUSTRY

L. J. Robertson, vice-president of the Tanners' Council and chairman of the committee on the tanning school, said that conditions were about all that the leather industry had today, so that viewing conditions from the schoolboy's standpoint the industry might be said to have flunked. The attitude of Secretary Hoover is encouraging, however, particularly in regard to extending credits to foreign trade for the purpose of helping the export business. The duty on raw hides and skins, which seems to be demanded by the agricultural interests, was declared unsound, since 40 per cent of the raw material for the leather industry is imported.

A better spirit of co-operation between seller and customer is noted and the feeling of hopelessness is passing away. This is fortunate for the industry, since it is very difficult to operate tanneries on a hand-to-mouth basis with rapidly changing styles.

In preparing to meet foreign competition, the tanners have encouraged research, established a tanning school and made studies of such problems as cost accounting methods, elimination of grubs and ticks, etc.

Mr. Robertson is of the opinion that tanners generally should have the benefit of the work done by the A.L.C.A. and he suggested that Tanners' Council should consider some plan by which dues would include a subscription to the journal of the A.L.C.A.

COLLOIDS

Prof. H. N. Holmes of Oberlin delivered a most instructive and entertaining address on "Colloids." The chemistry of colloids is the chemistry of very small things—that is, particles having the dimensions of a few hundred molecules. Bancroft prefers to call it the chemistry of grains, drops, bubbles, filaments and films with at least one dimension very small. Examples of the different types of colloidal suspensions were exhibited and passed around for inspection.

A property of colloidal suspensions which attracts immediate attention is their stability, which is found to be influenced by several factors: Brownian movement, the electric charge carried by the particles, protective films formed by substances such as gelatine or glue, which are consequently called protective colloids; viscosity, equal density in the two phases.

Colloidal suspensions may be prepared in many ways. Grinding is sometimes employed, but one of the most usual methods is peptization. This phenomenon takes place when glue is treated with water, for example. The glue does not dissolve to form a molecular solution, but is merely peptized (or subdivided) into aggregates of molecules. Silver bromide can be precipitated in a coagulated form only when exact equivalents of AgNO_3 and KBr are taken. The slightest excess of either results in the formation of a colloidal suspension

due to the adsorption of silver or bromide ions as the case may be. This is known as preferential adsorption of ions.

There are two general types of colloids—suspensoid and emulsoid. The former are very sensitive to added salts and give solutions having practically the same viscosity as the solvent used. Thus a 20 per cent suspension of precipitated chalk in water has practically the same viscosity as water. Emulsoid colloids are not sensitive to the addition of salts and yield viscous solutions or gels. Thus a 1 per cent sodium stearate suspension is solid.

Many interesting examples of gels and emulsions were shown and explained. One particularly striking observation was that precipitated silica is $\frac{5}{8}$ air by volume, whereas calculations show that there would be only 24 per cent air space if the particles touched. It is evident that the particles are not in contact, which accounts for the free flow observed in these very fine powders.

TANNING MATERIALS IN THE FAR EAST

Dr. Lloyd Balderson told of his experiences in search of tanning materials in China and Japan. The per capita consumption of leather in these countries is small, the Japanese wearing wooden shoes and the Chinese for the most part none at all. China does, however, produce some hides and skins for export and some leather is made in certain districts. Tanbark is unknown and smoke or mineral tannage is employed as a rule, although in Manchuria fermented milk is used in a manner similar to oil tannage. There are a few modern tanneries in the Canton district making black upper leather by the one-bath chrome process, using tanning materials imported from America.

Wattle and quebracho are imported into Japan and in a search for suitable domestic supplies of tanning materials, the speaker examined the bark from twenty-five species growing in northern Japan. Several of these were found to offer possibilities.

OTHER COMMITTEE REPORTS AND PAPERS

Dr. Thomas Blackadder's report of the findings of the committee on "Color Measurement of Vegetable Tanning Solutions" having been published in the May journal of the association, he merely summarized the results of the comparison of the Hess-Ives tint photometer with the Lovibard machine.

Other committee reports and papers presented during the convention were "The Estimation of Oils and Greases in Leather," by F. P. Veitch; "The Sugar Content of Leather," by J. S. Rogers; "Post-Mortem Changes in Fresh Hides," by G. D. McLaughlin; "Plumping Power of Tan Liquors," by A. A. Clafin; "Available Calcium Oxide," by F. P. Veitch and T. D. Jarrell; "Rapid Washing of Chromed Hide Powder," by R. W. Frey and L. D. Clarke; "Determination of Ep-som Salts," by R. W. Frey.

EXECUTIVE SESSION

President Small read the invitation extended to the Society of Leather Trades Chemists to send representatives to the meeting and the reply from the president, J. Gordon Parker, announcing the bi-annual conference to be held in London during the first week in September. Mr. Small also stated that a recent book of Josef Jettmar on "Eisengerbung" had been dedicated to the A.L.C.A. G. D. McLaughlin and G. W. Schultz were elected members of the council.

Recent Progress in High-Frequency Inductive Heating*

Notes on Design, Operation, Melting Rate and Power Input of Electric Furnaces Using High-Frequency Inductive Heating—Most Pretentious Furnaces Yet Constructed Are Melting Precious Metals at the United States Mint and for a Leading Silver Broker

BY E. F. NORTHRUP

Vice-President and Technical Adviser, Ajax Electrothermic Corporation

FURNACES for melting practically all metals and also glass and refractories by means of high-frequency currents¹ have been designed, built and sold:

- (a) High temperatures and vacuum type furnaces.
- (b) "Electric crucible" type furnaces.
- (c) Mint type furnaces.
- (d) Heat-treatment furnaces.
- (e) Graphitization furnaces.
- (f) Miscellaneous heating and muffle type furnaces.
- (g) Large tilting and pouring-type furnaces.

It is obvious that if the available power is limited to a definite maximum by the capacity of the transformers and condensers supplied, the highest temperature can be obtained only by restricting the volume of the mass to be heated.

HIGH-TEMPERATURE AND VACUUM FURNACE

The highest temperatures may be obtained with a furnace energized with a standard 20-kw. high-frequency

converter set when patterned after the standard high-temperature furnace shown in Fig. 1. It is of the non-tilting type, and its contents are removed through the bottom by withdrawing a slide of asbestos board. This type of furnace under favorable conditions will melt molybdenum and can be used to melt electrolytic iron in 5- to 6-lb. (2.3- to 2.7-kg.) lots strictly carbon free. The furnace is very suitable for the recovery of platinum scrap. When a crucible of carbon or Acheson graphite 2½ in. (5.6 cm.) inside diameter by 7 in. (17.5 cm.) long is used, and this is heat-insulated with lampblack, it is not difficult to obtain temperatures in from fifteen to twenty minutes which are more than sufficient to completely graphitize carbon.

For melting in vacuum, a quartz tube closed at the bottom is used which just fits the coil. This tube is fitted at the top with a water-cooled cover with a connection for exhausting the air. Refractories insulate better under high vacuum conditions, and the highest temperatures are easily obtained in vacuum with an expenditure of 10 or 15 kw.

"ELECTRIC CRUCIBLE" FURNACES

This type of furnace has been constructed in four sizes. The inductor coil and crucible are conical. The furnace sits upon a low table and makes contact with the high-frequency converter terminals by means of two metallic feet.²

All furnaces of this type are designed for pouring the metal contents in the same manner in which the contents of an ordinary crucible are poured, over its edge; hence the term "electric crucible." An "electric crucible" may be lifted by handles, placed on two opposite sides, entirely off the table and poured; or it may be pivoted, around an axis passing through its pouring spout, on trunnions. In this case it is lifted by a handle on the side in the back, and poured.

FIG. 1. STANDARD D-1 MODEL

converter set when patterned after the standard high-temperature furnace shown in Fig. 1.

The inductor coil of this furnace is made of forty-two turns of ¾-in. (1-cm.) flattened copper tubing. The inductor is wound as a solenoid and is 9 in. (23 cm.) long and 4⅝ in. (10.5 cm.) in inside diameter. The high-frequency potential is applied to the terminals of this solenoid and also a water pressure of 30 lb. (13.7 kg.) or more, which maintains a flow of water through the flattened tubular solenoid. The furnace may be used as a vacuum or as a non-vacuum furnace.

FIG. 2. SIX-INCH "ELECTRIC CRUCIBLE"

*A paper presented at the thirty-ninth general meeting of the American Electrochemical Society, held at Atlantic City, April 21-23, 1921.

¹See CHEM. & MET. ENG., vol. 20, p. 381 (April 15, 1919) and vol. 21, p. 258 (Sept. 1, 1919).

²Described in detail in CHEM. & MET. ENG., vol. 24, p. 309 (Feb. 16, 1921).

Fig. 2 is a view of a 6-in. (15-cm.) "electric crucible." This one either can be tilted around the axis supported by trunnions, or it may be lifted by the handles on its side, entirely off the table, and poured. If it is remembered that all types of furnaces operated by high-frequency induction are substantially at room temperature on the outside, the practicability of handling a furnace in these ways is readily seen.

This particular style and size of furnace is well adapted to melting precious metals, especially gold and platinum alloys. The furnace will melt and pour about 10 to 15 lb. (4.5 to 6.8 kg.) of copper, or about 8 to 10 lb. (3.4 to 4.5 kg.) of steel. The melting is extremely rapid, and when non-conducting crucibles are used, as would be the case when melting a platinum-gold alloy or a ferrous metal, the molten metal stirs violently—a circumstance which assures the perfect mix of an alloy.

Fig. 3 is a cross-sectional view of an "electric crucible" in which the crucible is about 10 in. (25 cm.)

FIG. 3. CROSS-SECTION OF 10-IN. "ELECTRIC CRUCIBLE"

in diameter at its top. It is designed to hold and melt about 50 lb. (22.7 kg.) of copper or brass and about 25 lb. (11.4 kg.) of steel. In this case a pour is made by lifting the "electric crucible" clear off the table on which it rests. The crucible is lifted and tilted for pouring by two persons, using detachable handles.

Twenty pounds (9.1 kg.) of chromium steel has been melted in a non-conducting crucible from steel turnings (hence the carbon content of the steel has not been changed) requiring 15 kw. and fifty-five minutes, starting with the furnace cold.

For melting pure platinum and iridium free from all contamination, an "electric crucible" has been made with a conical crucible 5½ in. (13.4 cm.) in diameter at its top. This conical crucible is made of molded silica ware. Fitting in this is the crucible proper, which holds the metal to be melted. This crucible can be molded of such suitable materials as lime, electrically shrunk magnesia, or the like. The purpose of the outside quartz crucible is to give perfect electrical insulation between the conical inductor coil and the metal contents of the crucible. The melting is, of course, produced by the currents which are generated by the inductor in the metal itself.

In using the above three "electric crucibles," in which it may be required to obtain very high temperatures, it has been found advantageous to maintain a flow of

water through the inductor coil. The water connections to the coil are made with rubber tubing a meter or more long, and it has been found that the resistance of this length of water column is sufficiently high to prevent the water circuit from acting as a shunt on the electric circuit.

A larger "electric crucible" without water connections and with a practically cylindrical crucible is, at the date of this writing, under construction. It is designed for melting and pouring brass or bronze in 200-lb. (91-kg.) lots. To secure more rapid melting, a 25-kw. high-frequency single-phase converter set will be used. As this type is a very recent development, performance data are not yet available.

In the 6- and 10-in. (15- and 25-cm.) "electric crucibles" copper melts and superheats to a suitable pouring temperature at the rate of about 4.2 lb. (1.9 kg.) per kw.-hr. As will be shown later, the melting rate with larger furnaces and more power is very considerably increased, 25 per cent or more.

MINT TYPE FURNACES

The Mint type of furnace was designed specially for use at the United States Mint in Philadelphia, Pa., in connection with work carried on in the deposit melting room.

Four furnaces of the same general type have been installed at the Mint for over a year, and two of these "have been operating daily since March 20, 1920, on small deposits, two small crucibles being used to each furnace, which practice has been followed on combustion furnaces for years past." The other two furnaces have more recently been put into continuous operation. "The results of a test run, melting fine silver bars, were as follows: Total amount melted, 13,478.50 oz. (382,115 g.); total time consumed, seven hours; total current used, 156.50 kw.-hr.; pounds melted per kw.-hr., 5.905 (2.68 kg.); average load per phase, 12½ kw. The results will be greatly improved when the capacity of furnaces is reached by having a full quota of condensers (which are now being installed) using 16 kw. per phase instead of 12½. The fuel cost at the rate of consumption shown above compares favorably with gas."

These furnaces are cylindrical, stationary furnaces and are designed for melting metals in a crucible which may be lifted out of the furnace and poured. In the larger furnaces the molten metal is dipped out until only a little remains in the bottom of the crucible. This last portion of metal is removed by then withdrawing the crucible and pouring it out. In the smaller furnaces the metal deposits are placed in small crucibles and lowered into a thin-walled graphite crucible within the furnace, which remains permanently in the furnace.

The four furnaces of this type installed at the Mint use a total of 48 kw.

Fig. 4 is a cross-sectional view of one of the two smaller furnaces which is used exclusively for melting down precious metal scrap in small crucibles.

In the 1920 report of the Director of the Mint, on page 20, a very favorable comment is made on these furnaces and it is there stated that their adaptation to Mint work on precious metals is advantageous.

FURNACE CRUCIBLES—COATED CRUCIBLES

In high-frequency induction heating of ferrous metals and other metals of high resistivity, as platinum, non-conducting crucibles are used. In melting gold, silver,

*Annual Reports Director of the Mint (1920), p. 19.

(a) The crucible and inductor coil are housed in a box made of sheet steel $\frac{5}{8}$ in. (8 mm.) thick. The box is $45\frac{1}{2}$ in. (114 cm.) high, $31\frac{1}{2}$ in. (78 cm.) wide, and $27\frac{5}{8}$ in. (69 cm.) deep. The top of the box is fitted with a heavy molded refractory piece. This has a central hole 10 in. (25 cm.) in diameter—the inside diameter of the crucible—and a carefully shaped pouring spout.

(b) The crucible and its steel housing may be rotated for pouring around an axis which passes exactly through the end of the pouring spout. The crucible may be raised in the process of pouring 15 deg. above the horizontal.

(c) The movable portion of the furnace is counter-weighted, whereby very little exertion is required to tilt and pour the charge.

(d) The space in front of the spout is free from mechanism, which permits molds to be brought by a carrier directly beneath the end of the spout.

(e) The furnace is free for approach by a man or a truck from behind, which arrangement gives facility to the charging.

FIG. 5. FURNACE FOR HANDY & HARMAN IN POURING POSITION

(f) The furnace when in its vertical position makes electrical contact with three leads from the high-frequency converter, and when tilted for pouring breaks these contacts with no arcing. The furnace has, therefore, no moving electrical conductors.

(g) The inductor coils, three in number and star-connected, have water circulating through them. The water is led in and out of these coils at the two ends of the axis of rotation of the furnace, by which device all movable water connections are avoided.

(h) The inductor coils and the housing of the crucible and inductor coils are at all times at or near

room temperature, which makes the furnace very comfortable to work around.

(i) The crucible is of carbon or Acheson graphite. It may be molded or turned out of a section of 12-in. (30-cm.) Acheson graphite electrode.

(j) The electrical insulation between inductor coil and crucible is a cylinder of micanite of a $\frac{3}{8}$ -in. (1-cm.) wall (and thus is avoided the use of a rather fragile quartz cylinder), which material has been found suitable for many of the small furnaces that have been made.

TABLE I. REPORT OF ONE DAY'S OPERATION OF SILVER MELTING FURNACE

Time	Kw.-Hr. Meter	Current	Kw.	Weight Sterling Silver, Oz.	Notes
7:45	2,727.3	8.5			
9:00	2,759.0	8.5	53		Crucible at 961° C. Put silver in.

Melt	Melting Time Only Lb./Kw.-Hr.	Rate of Melting Melting and Superheating Time Only Lb./Kw.-Hr.	Material
1	9.8	8.4	Fine silver and copper.
2	12.3	8.15	Sterling scrap.
3	12.7	10.2	Sterling scrap.
4	12.1	9.7	Sterling scrap.
5	9.4	8.0	Fine silver and copper.
Average.....	11.3	8.89	

Rate of melting: Average for all the time, 7.95 lb. per kw.-hr.

The performance of this furnace mechanically, electrically and metallurgically appears to be quite satisfactory. It is capable of continuous operation for eight hours or more and is actually being operated at the Handy & Harman plant in Bridgeport throughout a working day.

Table I shows the performance of one day's operation, and may be taken as typical of what the furnace is capable of doing.

GENERAL PERFORMANCE

It may be said in conclusion that the highly useful accomplishments of high-frequency inductive heating are simply unlimited—provided high-frequency power is available in commercial quantities, and at a cost which is not prohibitive. Certain it is that high-frequency converters, of a static character, are now available at reasonable price in single units up to 60 kw., and that these units may be multiplied for operating a single large furnace without any undue complication.

Two years' experience in building and operating many high-frequency equipments—over 500 kw. were in service at the end of last February—have proved beyond a doubt that the principles of high-frequency induction presented before this society in April, 1919, are perfectly sound, and both laboratory and commercial installations have been made which show that this new method of electric heating has come to take its place with other electrical methods of heating for the permanent service of science and the industries.

COCONUT RAFTS

Oils, Fats and Waxes in Latin America

A Survey of the Resources—Linseed, Coconut, Palm Nut, Castor Bean, Sesame, Peanut, Brazil Nut, Mustard, Manihot, Argemone, Nigerseed—Essential Oils: Linaloe, Cayenne, Petitgrain, Orange, Lime, Bay and Pimento—Vanilla and Tonka Beans—Carnauba and Candelilla Waxes

By OTTO WILSON

EXCEPT for a few stock products the area included under the term Latin America is almost an untapped reservoir of commercial commodities. In spite of the fact that South and Central America contained large and busy cities of 50,000 and more inhabitants before there was a permanent settlement in what is now the United States, most sections are still but thinly settled and their wealth continues to be largely latent. What is true of commercial commodities in general applies also to vegetable and animal oils. Outside of half a dozen products the resources of Latin America in this field have hardly been touched and great areas still await the explorer and cataloguer. The stretches of tropical forest and interior plains constitute a vast storehouse of these materials which can be unlocked only with the keys of labor, capital and transportation.

ARGENTINE LINSEED

So far as volume of exports is concerned the most important oil material that now comes out of Latin America is linseed. This is an Argentine product, one of the four or five chief crops of the wide River Plate plains. The area sown to flax each year in Argentina is greater than that in any other country of the world, being on the average about 3,000,000 acres, and at times the year's output from these plantings goes to over a million tons, or about 42,000,000 bushels, of seed. Before the war most of this production went to Europe, but in recent years the United States has been the chief buyer. So firmly established did this trade with Argen-

tina become during the war that it has been steadily increasing ever since the armistice, and in 1920 importations reached the high value of \$69,000,000. As the total imports of linseed into this country were about \$74,000,000, it will be seen that Argentina has become the great source of raw materials to our producers of linseed oil. During the last year of the war this source of supply was so valuable that the United States Government for a while requested weekly reports as to the state of the flax crop.

In Argentina itself there has been a small development of the oil-crushing industry, principally in Buenos Aires, where five plants have a reported capacity of about 8,000 tons of oil a year. These are all under the management of Italians. Another large plant near Rosario is backed by Dutch capital. War conditions brought about some overseas exportation of linseed oil produced by these mills, but for the most part their output goes to satisfy local demands and the requirements of consumers in neighboring countries. The mills do not run to capacity and there does not appear to be much prospect of the expansion of the industry. There has also been some crushing of linseed in Sao Paulo, Brazil, the seed being brought from Argentina and also from southern Brazil, where it is grown to a limited extent.

COCONUT RESOURCES

Contrasting with the linseed industry, which has probably come near its peak of development, at least for

many years, is the coconut industry of the tropical countries, the expansion of which is largely a matter of the future. Although coconut trees are found in all the lands washed by the Caribbean, along the Pacific coasts of Mexico, Central America, Colombia and Ecuador, and in Brazil, the output of American lands is only a small percentage of the world's total. It is roughly estimated that throughout the world from seven to eight billion coconuts ripen every year, and of this number probably not more than 200 million are produced by the Western Hemisphere. Many millions of these grow in uncultivated groves and are lost entirely, or are used locally by natives of the forest. Most of those that enter into commerce come from the plantations, which are found chiefly in Jamaica, Trinidad and Tobago, the Bay Islands, Old Providence and St. Andrew's Islands off the coast of Central America, and in Honduras and Panama. Along the Pacific coast line from middle Mexico to Guayaquil, Ecuador, and along the northern coast of South America the tall trees are found in profusion, now scattered and now concentrated in thick groves, but in few places are the trees regularly cultivated or the nuts systematically gathered. According to an estimate transmitted in a report from an American

garine, constituting 21.7 per cent of the total vegetable oils used in that industry in 1917, as compared with only four-tenths of one per cent in 1916 and before the European war. Since 1918, however, imports of coconut products have shown a marked falling off. Practically all of these heavy imports have been brought half-way round the world, from the Philippines and other Far Eastern lands, and scarcely any from the groves at our own doors.

The coconuts that come from Latin America are all imported "in the shell," and our total supply of whole nuts comes from these importations. Except for the sparsely settled condition of most Latin American countries and the consequent scarcity of labor and primitive conditions of transportation, there is no reason why that section should not some time send us our requirements in copra and oil as well as in nuts for confectionery and direct consumption. There is, however, no present indication that this change in traffic will take place. There is a considerable production of oil in Trinidad, Panama has an American factory of fairly large capacity, and some oil is produced in other localities, but this is all for local consumption. There is no effort to compete with the Philippines and other Far Eastern mills in shipping to the United States or European markets, and it will be a long time before the American coconut sets up as a rival to its Oriental cousin in the oil-producing business.

PALM NUT AND CASTOR BEANS

Two other tropical oil materials which can be produced in great quantities when the need becomes sufficiently pressing felt the stimulus of war demands, and one of them has been gathered in Brazil in continually increasing quantities since the armistice. These are palm nuts and castor beans. The former is the product of several different species of palm belonging to the same family as the coconut and the West African palm, and the trees are found all the way from Mexico to southern Brazil.

There are various names for the different species, such as cohune, corozo and coquito, and there is a confusion of names in the different localities. What is usually known as the cohune nut (*Attalea cohune*) is found most plentifully in British Honduras, Honduras and Guatemala, but trees also grow to an undetermined extent in Mexico and the Caribbean side of Panama. A cousin of the cohune tree (*Attalea gomphococca*) with narrower nuts and thinner shell, grows plentifully in western Mexico, the Pacific side of Central American states and on down through tropical South America, and other species are found scattered through the jungles of all this tropical region. Brazil has a number of them, and one of them which bears a fruit very similar to the well-known West African palm nut occurs in Panama and the adjoining Atrato district in Colombia.

Like the West African palm nut the nuts of these various species yield two oils, a kernel oil similar to coconut oil, and an outside oil contained in the pulp surrounding the seed, which must be expressed in the country where the palms grow, as it evaporates when the nuts are shipped overseas. Various attempts have been made to utilize the tens of thousands of tons of these nuts which ripen annually, but so far with little success in Latin America. The coconut-oil factory in Panama mentioned above has worked up limited quantities and a few thousands of dollars' worth of the oil has been exported by a factory in Colombia, but production

INDIAN WOMEN OF BRAZIL WITH BASKETS
OF PALM NUTS

consul Brazil has about 1,250,000 trees and produces annually 50,000,000 nuts, but they enter but little into any except local trade.

Throughout tropical America there is immense room for the expansion of coconut planting—the possibilities, in fact, are limited only by the demand for coconut products. There are two contingencies which will bring about this expansion. One is a steady increase during the next twenty-five or fifty years in the call from the world's markets for coconuts and coconut oil which will be loud and continuous enough to induce capital to tie itself up in this long-range investment. The other is a diversion of the United States import trade from the distant Orient to her southern neighbors.

During the war period, with its skyrocketing of prices for animal fats, the demand in the United States for coconut oil showed an immense and unprecedented expansion. In a short time imports of copra and coconut oil increased 700 or 800 per cent, reaching their highest point in 1918, when our copra purchases amounted to almost a quarter of a million tons and our purchases of coconut oil to more than 250,000,000 lb. This imported oil and that obtained from the imported copra went largely into the manufacture of oleomar-

is largely a side line to that of coconut oil. The war demand for these nuts was not for the oils, but for the shell, which was found to be one of the best of all materials for making absorptive charcoal for gas masks. Thousands of tons were gathered for this purpose, but only the extraordinary conditions made it profitable to get them out, and collection stopped short with the armistice.

When it became known that castor oil was in demand for airplane engines and the allied governments sent out calls for immense quantities, there was a wave of interest in nearly all countries of Latin America, as the castor-bean plant was found growing everywhere and in many places was looked on as a pest. Thousands of acres were quickly planted in Cuba, the Dominican Republic and other West Indian islands, in several Central American countries, and in Colombia, Venezuela, Peru and Brazil.

When the war demand ceased the cultivation of the plant in general dropped off and the industry of gathering and crushing or exporting the seeds returned to about what it had been before the war, serving mostly local needs. But in Brazil the momentum acquired during 1917 and 1918 has continued, as is strikingly indicated by the export figures. In 1915 the exports of castor seed were only 234 tons and of castor oil about 8 tons. By 1918 they had mounted to 4,066 tons of seed and 3,830 tons of oil, and by 1919 to 23,777 tons of seed and 1,389 tons of oil. In the first six months of 1920, according to the latest available statistics, exports were 15,570 tons of seed and 450 tons of oil. It is evident that the Brazilian castor seed is making a strong bid for the trade formerly held by India. Most of the seed has been coming to the United States, with smaller proportions going to Great Britain, Portugal, Belgium and Germany, while Italy, Spain and France have taken most of the oil. Pressing is carried on largely in the Sao Paulo district in connection with the

SEPARATING BROWN COTTON FROM WHITE AT A COTTON GINNEY IN PERU

production of other vegetable oils, and activity fluctuates with the demand for the product. Much of Brazil's seed comes from the wild trees, although planting has reached many thousands of acres.

COTTONSEED OIL

Cottonseed crushing has also reached its greatest development in Brazil, which country indeed seems to be the great future field for the production of vegetable oils. Cotton seed is obtained when the home-grown cotton is cleaned and prepared for spinning into yarn and thread for the several hundred textile mills of the country, and in many cases the seed is obtained and sold or crushed by these mills themselves. The growing of cotton and the manufacture of cloth, as well as the crushing of seed, are directly encouraged by the federal and state governments by loans and otherwise, and the future expansion of the industry is assured. Other countries in which cotton is grown and the seed crushed are Peru, Colombia, Venezuela, Argentina, Mexico and various West Indian islands.

SESAME OIL

In addition to these oil-producing plants those whose development in Latin America is advanced to only a fraction of their possibilities make a long list. Without attempting to catalog them all, the following may be mentioned: The sesame plant has been cultivated chiefly in Mexico, where it is known as "ajonjoli." According to an official report of a United States trade commissioner, "sesame seed is one of the articles of Mexican agricultural production which is capable of tremendous development and wherein lies almost unlimited commercial possibilities. There are two easily distinguishable varieties of sesame, the white and the brown. Both of these are produced in Mexico. . . . Authoritative and expert opinion testifies that the only requisite needed to produce an almost unlimited supply is increased utilization of the acreage now lying idle.

"In view of the world demand for edible oils, there is reason to expect a development along this line in the near future. The oil content of sesame, according to Mexican Government estimate, is 50 per cent. Others place the content at 56 per cent. Aside from this the pulp is highly nutritious. In view of these facts, sesame compares favorably with cotton seed in food value. It is almost equal to the olive in oil content, and in taste, odor and adaptability for commercial uses it is quite as desirable as the latter. . . . The white variety is said

PALM TREES IN BRAZIL

The thick vegetation adds materially to the difficulty and expense of collection.

to be richer in oil content than the two subvarieties of black or brown sesame.

"There are fifteen factories of different sizes and of varying importance in the city of Mexico engaged in the extraction of sesame oil and in its preparation for market. The greater number of these, however, are one-press affairs with very slight capacity. . . . The first-grade oil is used for seasoning and for the same miscellaneous culinary purposes that olive oil and lard are used for. The better grades of oil are used also in the manufacture of oleomargarine and to adulterate other edible oils. The inferior oils are used for soap-making, as a combustible, and as a basis for perfumes. [This use in perfumery manufacture has been questioned and is subject to verification.—O. W.] The leaves of the sesame have medicinal value and contain gelatinous substances. The pulp which remains after the oil is extracted is valuable as stock food."

PEANUT OIL

Peanuts, also known as groundnuts, earthnuts, monkey nuts, etc., are found in all parts of Latin America and in many places are crushed for oil, notably Uruguay, Argentina and Brazil. Exports of peanuts from Brazil have reached as high as 1,100 tons in one

PEANUT FIELD, CAMPO LARGUA, ARGENTINA

year. Olive trees take up several thousand acres in Chile, and the fruit is also raised in the neighboring country of Argentina. Peru has olives of good quality and exports a few tons each year, but consumes most of the production herself. Olives are grown commercially in several states of Mexico, the fruit being sent to the refineries of the capital.

BRAZIL NUTS

Brazil can fairly claim first place as the home of new oil-bearing seeds and nuts that promise to develop into important commercial commodities. Among these are the babassu and ucuhiba nuts and those commonly known as Brazil nuts, all of which have been exploited sufficiently to form considerable items of export. The babassu nut is a palm nut related to the coconut, whose meat is similar to coconut meat and whose oil is said to be excellent for oleomargarine. The nut yields about 66 per cent oil. The trees are found mainly in the interior of the north, along the Parnahyba River, and gathering has progressed to the point where some thousands of tons are exported annually.

Ucuhiba nuts (*Myristica bicuhyba*) yield a fat which becomes hard and brittle and may be refined to an almost odorless condition, although as marketed the nut is yellowish brown and has an odor similar to

that of coconut oil. It consists mostly of myristin with about 10 per cent of olein and a small amount of an ethereal oil. It has a melting point of 35 to 42 deg., a specific gravity of 0.871 to 0.912, and an iodine value of 9.5 to 18.5 per cent¹. These nuts also come from northern Brazil and in 1918 and 1919 exports amounted to over 1,000 tons, besides which large quantities were used in Brazil candle manufacture.

The Brazil nut so familiar in confectionery stores yields a fine semi-drying oil said to be valuable for cooking and also for use by watchmakers and artists. The nuts contain up to 73 per cent of oil, which is of a pale yellow color and has a taste similar to that of the nut itself, but is without odor. In South America the oil is used for edible purposes, and soap is made from nuts that become moldy in shipping. The oil has a saponification value of 193.4 to 202, according to tests made, an iodine value of 98.3 to 106.2, and a specific gravity of 0.918.

MUSTARD OIL

Both the black and the white mustard are found in Brazil, and the seeds yield 10 to 15 per cent of their weight in a semi-drying oil, similar in chemical properties to rape oil. The oil from the black seed is not suitable for burning and is chiefly used in making soap, while that of the white seed is used both as a burning and a lubricating oil. No tests of the Brazilian seeds are reported, but Italian black seed showed a specific gravity of 0.917, an iodine value of 112.7 and 116.1, and a saponification value of about 175. The white seed is similar to the black except that it has a lower iodine value.

Cashew or caju nuts are a regular item of export. It is said that they are growing in favor in the manufacture of chocolates. The oil is a non-drying oil with an iodine value of 84 and a saponification value of 195. Brazil can supply all that the trade requires.

MANIHOT OIL

The seeds of the famous rubber trees of Brazil yield two different kinds of oil, one from the species of tree growing in the State of Ceara, called manihot oil, and the other from the Para rubber tree and known by that name. Both are drying oils. The former is of a yellowish-green color, with an odor resembling that of olive oil and a slightly bitter taste, and in Brazil it is expressed to be used as a substitute for linseed oil. The latter is of a light yellow color with an odor like that of linseed oil. The cake is said to be unsuitable for cattle feed because of the presence of a small amount of prussic acid. For both oils the specific gravity has been found to be about 0.923 and the saponification value around 189; the iodine value of the manihot oil, according to one test, was 137 and that of the Para seed oil 117.6 to 133.3.

ARGEMONE OIL

The Mexican or prickly poppy, native to Mexico and the Caribbean islands, yields an oil called "argemone" oil, which is used for burning and lubricating purposes and also has a recognized therapeutic value. It is of a light yellow color with a distinctive acrid odor and is classed as a drying oil. The seeds yield commercially

¹Data relating to properties of fixed oils are taken largely from Lewkowitsch, J. L., "Chemical Technology and Analysis of Oils, Fats and Waxes," Vol. II, and data relating to properties of essentials from Parry, E. J., "The Chemistry of Essential Oils and Artificial Perfumes."

about 25 per cent of their weight in oil. The oil has a specific gravity of 0.924, a saponification value of 187 to 190, and an iodine value of 119.9 to 122.5, according to the results of laboratory analyses. Brazil also produces poppy-seed which is said to give 28 liters of oil to 100 liters of seed, the oil being expressed for use by painters, particularly in painting wood.

NIGERSEED OIL

Nigerseed oil, a yellow, drying oil with a nutty taste, is found in the West Indies, but has not been developed into a product of commercial importance. In India this oil is used as a substitute for ghee, or native butter. Lower grades are also of value for soapmaking, the saponification value running about 190, and as a substitute for linseed oil. Another oil used for much the same purposes is sunflower oil, considered as a drying oil, although it dries more slowly than most others of that class. The soap made from it is said to be especially suitable for textiles. It also enters into varnish manufacture, and is used locally for cooking and burning purposes. It has a saponification value of about 190, a specific gravity of about 0.92, and an iodine value of 119 to 135. Sunflowers are indigenous to Mexico and planting there can be indefinitely extended if the demand grows. In Argentina they form a minor crop of some importance, exports of sunflower seed in 1919 amounting to over 4,000,000 lb. valued at about \$120,000.

MISCELLANEOUS OIL-BEARING SEEDS

The soya bean of the Orient has been successfully grown in the Guianas of South America, but it is not produced in quantities. Corn oil is pressed out from some of the abundant crop of maize in Argentina and in 1917 shipments to the United States amounted to over 330,000 lb., although this was due to extraordinary conditions and normally this country does not import from Argentina. The seeds of the kapok plant, which is grown in many parts of tropical America for its fiber, yield an oil very similar to cottonseed oil, which is used locally for edible purposes and in Europe for soapmaking. It has a saponification value of 181 to 205 and an average iodine value of about 120. A semi-drying oil called "pinot" oil, the fat of which is known as Para butter, is taken from the kernels of the pinot or ouassey palm in Brazil and French Guiana, where it is used for edible purposes.

In Central America some attention has been given to the production of piñon or curcas oil, which has purgative qualities much more pronounced than those of castor oil. It is used locally for soapmaking and as an illuminant and also occasionally as a lubricating oil, although it is not very suitable for that purpose, as it dries in about twenty-four hours. Jamaica produces a non-drying oil called ben oil which has been known for a century as especially valuable for lubricating delicate machinery. It is odorless, has a sweet taste, and in the East has been used as a cosmetic and as an agent in the extracting of perfumes from flowers. It has a specific gravity of about 0.92, a saponification value of 184 to 187, and an iodine value of about 111.

French Guiana grows a tree whose seeds are known as "Java olives," which yield a yellowish-colored oil which when heated solidifies to an india-rubber consistency. In Brazil and the Guianas occur the "paradise-nut" trees, the nuts of which are about one-half oil, and resemble Brazil nuts, although with larger kernels. They are highly esteemed as a food article and so are

COHUNE-NUT TREE IN CENTRAL AMERICA
Showing size of bunches of nuts as compared with size of a man.

seldom exported, although the trees are found all over Brazil. Corapa oil is obtained in the Guianas from a plant of that name and is used by the natives to protect themselves against insects and also for lighting. French Guiana has a palm oil called aoura or tucum oil, which is used for cooking, and the Guianas also produce a butter-nut from which an edible fat called "suwarri" is obtained.

Argentina produces and exports considerable quantities of rapeseed from which the well known rape oil or colza oil is expressed. In 1919 shipments abroad amounted to 1,200,000 lb. valued at \$41,000. This oil is widely used as a lubricant, and for two other special but very different purposes. Bakers use the better grade of colza oil for greasing the ends of their loaves, and the commoner grades are used for quenching steel plates.

ESSENTIAL OILS

In the field of essential oils the contributions which Latin America is making or stands ready to make to the world's commerce are also numerous and valuable. For the most part they are the products of the tropical regions of northern South America, Mexico, Central America and the West Indies, wide areas of which yet remain to be explored. It is reasonable to expect that this *terra incognita* contains many oils, nuts and woods not yet catalogued. The value of the essential oils now produced is small compared with that of other commercial products, but that is due not to small resources or

THE COHUNE NUT OF CENTRAL AMERICA

The thick, hard shell of this nut was what made it so valuable for gas-mask manufacture and led to the gathering of some thousands of tons during the war.

possibilities, but to the fact that the demand is not insistent enough to overcome costs of exploitation in undeveloped territories.

LINALOE OIL

Mexico and French Guiana produce one of the best known perfumery oils distilled from wood—the linaloe or linaloe oil, but the product that goes by that name in Mexico is quite different from the Cayenne or French Guiana product. The Mexican oil is obtained from a tree known locally as “bois de citron du Mexique,” which is found in the southern part of the country. The best oil comes from trees 40 to 60 years old, although oil is also obtained from younger trees and from the fruit. Distilling is carried on both in Mexico and in Europe, to which quantities of the wood are regularly shipped. The oil is colorless or pale yellow, with a sweet odor, and a specific gravity of 0.875 to 0.898. It is soluble in 3 volumes of 70 per cent alcohol or in 4 or 5 volumes of 60 per cent alcohol. The most important characteristic of the oil is the free linalol, which has an odor like lily of the valley and which is present to an undetermined extent. Parry also mentions two samples of linaloe oil from Mexico which had an odor of blended lavender and petitgrain, a specific gravity of 0.897 and 0.893, and an ester content of 52.4 per cent and 48.7 per cent, of which he says:

“Particular attention is directed to this oil, because it may be that it would be well to develop the distillation of this particular wood for its content of linalyl acetate and for the purposes for which oils containing that ester are used, rather than for linalol and the purposes for which oils containing that alcohol are employed.”

CAYENNE, LINALOE AND SANDALWOOD OILS

The Cayenne oil is derived from a species of wood distinct from that of Mexico and usually known as “bois de rose femelle,” although the botanical origin is not quite clear. The oil is very similar to Mexican linaloe oil and is not to be confused with the oil known commercially as rosewood oil, which is quite a different product. The wood from which the oil is distilled, however, is gathered in and exported from French Guiana under the name of rosewood. Both the wood and the oil are exported. The wood yields about 1 per cent of oil, which in the pure state has a specific gravity of 0.87 to 0.88 and an ester value of 3 to 7. French Guiana also produces limited quantities of a wood which has taken the name of that most ancient and historic of aromatic woods, sandalwood, although it is quite

different from the Indian product. Its botanical and chemical characteristics do not appear to have been yet determined accurately. There is also a West Indian sandalwood, very similar to the rosewood of French Guiana, known as the “bois de citron” of Domingo, which has been shipped to Europe for over a century. The oil is a thick yellow oil with an odor similar to that of cedarwood oil. It has a specific gravity of 0.948 to 0.972 and is soluble in an equal volume of 90 per cent alcohol. It has been used as an adulterant and substitute for the genuine sandalwood oil.

PETITGRAIN OIL

Citrus plants yield a number of different kinds of essential oils all of which figure as more or less important Latin American products. The oil of petitgrain, distilled from the leaves, buds and young fruit of the orange tree, forms the chief item of direct export to the United States from Paraguay, where the industry of extracting it has been considerably developed because of the existence there of great numbers of bitter orange trees. The oil or essence is obtained by passing steam through a quantity of leaves packed in a specially designed receptacle, from 500 to 600 lb. of leaves being required to produce a quart of oil. This South American product is inferior to most other petitgrain oils received on the world markets, probably because the extraction is carried on under rather primitive conditions. Its specific gravity, about 0.887, and its ester content, about 36.5 per cent, are both higher than other petitgrain oils. Oil of petitgrain is used as a basis of perfumes and perfumed toilet soaps. Another valuable product of the Paraguay orange groves, exported to a limited extent, is oil of neroli, obtained from orange blossoms.

ORANGE OIL

The production of orange oil, which comes from tiny vesicles in the skin of the fruit, has been especially prominent in Jamaica, and exports have at times amounted to more than \$100,000 a year. Both bitter oranges and sweet oranges are used as a source of this oil, but that from the sweet oranges is considered best. It takes almost 500 oranges to supply a pound of filtered oil. Most of the Jamaican product comes to the United States and is used in the making of perfumes, flavors for soft drinks, and essences, and particularly for flavoring a certain kind of fancy biscuit. It is also used in drug manufacture and to a small extent in the manufacture of soaps. The Jamaican orange oil is said to be equal or superior to the Sicilian product.

OIL OF LIMES

Oil of limes in the West Indies is of two kinds, one which is distilled, being obtained as a byproduct in the concentration of limejuice, and the other hand-pressed, of a higher specific gravity (0.878 to 0.902, as compared with 0.860 to 0.872 for the distilled) and a higher commercial value. The distilled oil is the usual oil of commerce. It forms a regular export item from many West Indian islands, among which the more important producers are the islands of Montserrat, Jamaica and Dominica. The leaves of the West Indian lime tree also yield an essential oil on distillation. Lemon oil is also a possibility of these regions, particularly of Jamaica, but its production has not yet become an industry. Mexico is a particularly promising field for the establishment of a lime-juice and lime-oil industry. Lime trees are at present cultivated hardly at all, but they

grow wild over a wide area and could be utilized in producing large quantities of oil of limes, lime juice, and citrate of lime.

BAY AND PIMENTO OILS

Besides orange and lime oils the chief essential oils found in the West Indies are bay oil and pimento oil. The bay tree grows abundantly in Jamaica, St. Thomas, Guadeloupe, Antigua, Barbados and Dominica. Both the leaves and the oil are exported to the United States, and are constant items in the lists of exports of those islands. Bay oil, which is used in perfumery and as a basis of bay rum, when distilled from the leaves separates into two portions, one lighter and the other denser than water, the two being combined to give a normal distillate. The oil contains 55 to 68 per cent of phenols, but the amount is found to vary with the different seasons of the year.

Oil of pimento is distilled from the fruit of *Pimenta officinales*, indigenous to the West Indies and found especially in Cuba, Haiti, Trinidad, Santo Domingo, Antigua and the Leeward and Windward Islands, and abundantly in Jamaica. It also occurs in Mexico, Costa Rica and Venezuela. Pimento berries, which are gathered green, have an aromatic odor in which can be detected the odor of cinnamon, nutmeg, pepper and especially cloves—hence the popular name of “allspice” applied to them. They yield 3 to 4½ per cent of a dark-reddish oil of the same aromatic odor as the fruit. It contains phenol-eugenol, which gives it the clove-like odor, the phenols being present to the extent of about 65 to 80 per cent. The oil has a specific gravity of 1.024 to 1.056.

Other possibilities of Jamaica, not yet developed, include vetivert and camphor. Camphor trees grow in considerable numbers in Jamaica, and a special test of the camphor derived from their leaves and wood which was made several years ago showed that it was of fully as good quality as that from the Far East.

In the River Plate countries, Argentina and Paraguay, grows a tree indigenous to that region which yields an oil of some importance commercially. This is the champaca or guaiacum wood oil, not, however, to be

confused with the true champaca oil of Europe. The wood yields 4 to 8 per cent of essential oil which is practically solid at ordinary temperatures. It has an exceedingly delicate odor described as resembling that of tea and violets, and it is used in perfumery to produce a tea-rose odor and to blend with stronger perfumes for ordinary scents, and sometimes as an adulterant of otto of roses. It is often mixed with geranium oil and used under the name “essence de la gaïac à la geranium.” Its specific gravity is given as \$.965 to 0.975 at 30 deg., and it is soluble in 3 to 5 volumes of 70 per cent alcohol.

MISCELLANEOUS ESSENTIAL OILS

Other essential oils and materials from which they can be distilled cover a wide range. Flowers and blossoms of trees which yield fragrant perfumes abound in rich profusion throughout the tropical forests of the Amazon and Orinoco valleys, French Guiana alone being credited with half a hundred or more. In Brazil, to mention two or three of the many plants aside from those described above, the leaves of a plant called the “false jaborandi” yield a light-greenish oil of spicy mint-like odor and pungent burning taste; the leaves of the “catingueira” furnish an oil with a greenish fluorescence and an odor resembling bergamot; the wild lemon tree leaves contain an oil having an odor of bergamot and lemon, and those of the wild coffee tree an oil with a lemon-like odor; from the bark of *Cassia caryophyllata* is obtained an oil containing eugenol and having a clove-like odor. In Bolivia is a grass which belongs to the same family as lemongrass and citronella, yields an oil similar to vetivert, and grows very abundantly. In British Guiana and Brazil the priprica tree's branches contain an essential oil somewhat similar to linaloe oil. Throughout Mexico, especially around Mexico City and other cities and towns, grow a great profusion of cultivated flowers such as poppies, pansies, carnations, chrysanthemums, violets, gladioli, and irises. Nutmeg or mace oil is a product of several localities. Mexico and Central America yield turpentine, which may some day be drawn upon to help preserve the diminishing supplies in the United States.

A well-known oil which comes from Brazil, Venezuela and Colombia is copaiba oil, imported into the United States usually in the form of copaiba balsam. Northern Brazil has seven species of *Copaifera officinalis*, from which the balsam is taken. In Bahia the oil is extracted by means of suction pumps. Closely related to copaiba balsam is balsam of Peru, which comes largely from Salvador. Tolu balsam, a similar product used in perfumery, comes mainly from Colombia.

VANILLA BEANS

Two other products, which are not essential oils but are widely used as flavoring extracts, may be mentioned. These are vanilla beans and tonka beans. The original home of the vanilla bean is said to have been Mexico, and that country continues to be one of the chief producers, although the tiny colonists sent out to other tropical lands have established themselves so well that most of the world's supply now comes from Old World sources. In Mexico the vine grows both wild and cultivated. The State of Vera Cruz is the center of cultivation. The beans grow in pods, 6 to 9 in. long, and it is the carefulness observed in curing and drying these pods which determines the flavor of the commercial product.

AMERICAN UPLAND COTTON IN PIURA, PERU, LOCALLY KNOWN AS “EGIPTO”

The curing process consists of piling the pods in heaps for a few days, then exposing them to the sun, then wrapping them in a woolen blanket, and at night permitting them to sweat in air-tight boxes. They are then dried for about two months in the sun. Mexican vanilla is rated very high as compared with the product of other countries. In the West Indies several islands raise vanilla, and its cultivation in the French island of Guadeloupe has made it one of the colony's chief resources.

TONKA BEANS

Venezuela and the neighboring islands of Trinidad and Tobago are the chief source of tonka or tonquin beans, although the trees are also found in the Guianas and Brazil. These beans grow in long pods, which are gathered and dried until the pulp shrivels, when the shells are cracked and the seeds or beans are extracted. After being put through a process of preparation and drying they are exported to be used for various purposes such as scenting tobacco and snuff, fumigation, and use in sachet powders. They furnish coumarin, an essential ingredient of perfumes and flavoring extracts.

ANIMAL FATS

Of the animal fats the chief is of course the lard and tallow which form one of the important products of the meat-packing establishments of the River Plate countries and southern Brazil. These plants also turn out certain quantities of bone grease and bone oil, and the United States obtains from them large amounts of neatsfoot oil and stock. From the wool-growing countries Argentina and Uruguay come supplies of wool grease or lanolin. Brazil has developed the whaling industry to the point where whale-oil exports amount to \$45,000 or \$50,000 annually, besides which large quantities are consumed locally. The states of Pernambuco and Bahia are the chief centers of the industry, and the season usually lasts from April to August or September, when the Antarctic whales come north to find warmer waters. Turtle oil and alligator fat are possible products of Caribbean coast regions which have not yet received much attention.

CARNAUBA AND CANDELILLA WAX

Among the waxes of Latin America the one which occupies first place commercially is a product of Brazil—carnauba wax. It has a variety of uses. Candles, polishing pastes, varnishes and phonograph records are made from it and it is also used for cable coverings, waterproofing, etc. In 1919 Brazil sent 13,700,000 lb. of this wax, valued at \$5,000,000, to foreign countries, chief of which was the United States, which took 7,000,000 lb., and Great Britain, 3,200,000 lb. The wax is especially plentiful in the State of Ceara, in the northern part of Brazil. The leaves of the palm tree which furnish this wax are gathered during the months from September to March, from 2,000 to 4,000 leaves being required to supply 16 kilos of wax.

In Mexico an important wax called "candelilla" is obtained from a low-growing plant of that name which is found all over the northern part of the country. Many factories have been set up to extract this wax by boiling the plants in water to which sulphuric acid is added. The city of Monterey is one of the centers of manufacture. The wax is very hard and has a melting point of 150 to 175 deg. F., and can be bleached perfectly white. It is said to be more brittle than beeswax,

and dissolves in turpentine, chloroform, hot ether and benzine. It makes excellent candles, varnish and shoe polish, and may also be used for making phonograph records, insulation for electric wires, and plasters and ointments.

Beeswax comes from all parts of Latin America. Brazil exports very considerable amounts and the United States also receives small shipments from Ecuador, Mexico, Cuba and various other countries and islands. Ecuador reports a kind of palm wax which might be used in place of beeswax and for which local producers have requested inquiries from possible United States buyers.

Refining Chinese Bismuth Concentrates

BY ELTON R. DARLING

THE Chinese bismuth concentrates are yellow in color and vary in size from 4 to 100 mesh. They analyze about 58 per cent bismuth oxide, with 5 per cent of antimony and 0.14 per cent of arsenic, both expressed as the metals. The presence of antimony and arsenic renders the treatment of these concentrates for pure bismuth very costly.

The writer has been engaged upon researches whereby these two metals could be eliminated cheaply and the bismuth used for pharmaceutical purposes.

The following process gives satisfactory results:

The concentrates as received are reduced to about 80 mesh and dumped into vats, where they are extracted with warm hydrochloric acid solution prepared by the action of sulphuric acid upon a solution of sodium chloride. After extraction the whole is allowed to settle and the liquor drawn off into a second vat and this treated with metallic iron to precipitate the antimony and bismuth. The arsenic is not affected and remains in solution. The whole is then filtered and the resulting solution returned to the ore for a second extraction.

The gray precipitate containing the antimony and bismuth is washed well with water, spread out upon trays, and dried. The completely dried mass, in which the bismuth is in the form of hydrate, is then treated with a 15 per cent solution of hydrochloric acid; when the bismuth hydrate dissolves, the antimony, being insoluble, settles to the bottom. The solution of bismuth chloride is then drawn off and added to a large volume of water, which causes the precipitation of bismuth oxychloride. This is allowed to settle, the water drawn off and more fresh water added, the washing being repeated until the wash water is free from acid. The bismuth oxychloride is dried, mixed with charcoal as a reducing agent and with sodium carbonate, lime and fluorspar as a flux and reduced to the metal in iron crucibles.

Bromine in 1920

Bromine, which is derived from brines pumped from deep wells in Michigan, Ohio and West Virginia, was produced by eight firms in the United States in 1920. The output, according to the United States Geological Survey, was 1,160,584 lb., valued at \$745,381, a decrease of 37 per cent in quantity and nearly 40 per cent in value from the output in 1919. The quantity produced, however, was greater than in any year before 1918.

The average price per pound received by the producers rose from 13c. in 1910 to \$1.31 in 1916 and was 64c. in 1920, which is more than three times the average price in the year before the war.

The Use of Fluorides in Solutions for Nickel Deposition*

An Outline of the Experimental Work Leading to the Conclusion That Deposits of Nickel of Finer Structure and Higher Tensile Strength Are Obtained From Fluoride Solutions Than From the Corresponding Chloride Solutions

By WILLIAM BLUM†

IN CONNECTION with a process for the electrolytic reproduction of engraved printing plates, recently installed at the Bureau of Engraving and Printing under the supervision of the Bureau of Standards, it was necessary to secure for the printing surface nickel coatings which would be as hard as possible, but at the same time free from brittleness or a tendency to curl. In connection with this process the addition to nickel solutions of hydrofluoric acid or fluorides, recently recommended by E. G. Lovering, was investigated. The beneficial effect of such additions upon the physical properties of the deposited nickel was found to be so great that this type of solution was adopted and has been used successfully in the above-mentioned plant.

HISTORICAL

As the nickel solutions employed usually contain boric acid, we may assume that upon the addition of fluorides, fluoborates are formed. The use of fluoborate solutions for plating was first proposed by Leuchs,¹ who made experiments with several metals but not with nickel. In 1908 Kern and Fabian² employed a nickel fluoborate solution, from which they secured a thick deposit ($\frac{5}{16}$ in. = 8 mm.) having desirable physical properties. About this same time, O. P. Watts³ and his associates made a few experiments with nickel solutions containing fluoborates and also secured promising results. In 1912 they found that good deposits could be secured from nickel fluoride solutions containing free hydrofluoric acid. In the same year A. Hollard⁴ experimented with a nickel fluoborate solution for making electrotypes. So far as known to the author, however, no commercial applications of nickel solutions containing fluorine was made until recently, when E. G. Lovering,⁵ of Detroit, operated plating solutions containing in addition to the usual constituents—viz., nickel sulphate and boric acid—small amounts of hydrofluoric acid. He obtained such remarkable results that he designated hydrofluoric acid as the "magic fluid." Subsequently F. J. Liscomb⁶ published the results of a few experiments in which he employed solutions of nickel fluoborate and nickel-ammonium fluoborate, from both of which he obtained only fairly satisfactory deposits.

Publication and discussion of Lovering's results caused numerous electroplaters to try the use of hydrofluoric acid in nickel baths, with thus far somewhat contradictory results, owing in part, no doubt, to failure to define or control all of the conditions employed by them. Even though very marked effects are produced by the fluorides in the presence of boric acid, there is no reason to believe that such solutions form a panacea for all the ills of the plater. Just as the studies of cobalt plating several years ago led to important improvements in nickel plating, the investigation of fluoride nickel solutions may throw light on the behavior of the nickel solutions more commonly used, and may thereby lead to their improved operation.

GENERAL PRINCIPLES

If hydrofluoric acid is added in small amounts to a nickel bath, the acidity thus produced will cause an increase in anode efficiency and a decrease in cathode efficiency, and at least a partial neutralization of the hydrofluoric acid, to form either nickel fluoride, or, in case boric acid is present, a fluoborate. Since good nickel deposits cannot be secured from solutions which are appreciably acid, the solution must be operated for some time after the addition of hydrofluoric acid, or the bath must be neutralized, before satisfactory results are obtained. It therefore appears more logical to neutralize the hydrofluoric acid before adding it to the bath.

In order to produce baths of relatively simple composition the fluorine was first added in our experiments in the form of nickel fluoride, prepared by the solution of nickel carbonate in hydrofluoric acid. When commercial nickel carbonate in excess is treated with 5N hydrofluoric acid a solution is obtained which contains only about 80 per cent of the amount of nickel equivalent to the hydrofluoric acid used. It is evident, therefore, that in such solutions there is a tendency to form acid fluorides. With freshly precipitated nickel carbonate, neutralization is more rapid and more nearly complete, but in no case is a neutral solution obtained. This observation is in general accord with the experiments of F. H. Edminster and H. C. Cooper,⁷ who found that if hydrofluoric acid is neutralized with nickel carbonate the definite crystals obtained by several recrystallizations have the formula $\text{NiF}_2 \cdot 5\text{HF}$, although there is a tendency to form crusts having approximately the composition NiF_2 . For simplicity, we may assume that the solution contains nickel fluoride, NiF_2 , and a small excess of hydrofluoric acid.

If now boric acid in excess is added to such a solution, a precipitate, which probably consists of nickel hydroxide, separates, and the resultant solution contains

nickel in the ratio of approximately 1Ni to 4F. About the same ratio is obtained if the hydrofluoric acid and boric acid are first mixed and the resultant "fluoboric acid" is neutralized with nickel carbonate. It is difficult to assign a formula to the "fluoborate" which probably exists in such solution. If we assume the simplest formula for fluoboric acid—viz., HBF_4 —we would expect the formation of nickel fluoborate having the formula $\text{Ni}(\text{BF}_4)_2$ —i.e., with 1Ni to 8F. To produce such a compound by reaction between nickel fluoride and boric acid would require a reaction such as the following:

The reaction which actually occurs is apparently similar to this, but no doubt less simple, and the salt formed is a more complex fluoborate. Hollard⁸ used hydrofluoric acid and boric acid in proportions to yield a solution approximately 0.8N in HBF_4 and 0.2M excess H_3BO_3 , and agitated the solution for twenty hours with freshly precipitated nickel carbonate to secure complete neutralization, but did not record the nickel concentration of the resultant solution. As pointed out in a paper on lead fluoborate solutions⁹, there is a great need for study of the constitution of fluoboric acids and fluoborates.

In view of the uncertainty as to the constitution of the nickel fluoborates which are almost certainly present in these solutions, it is most satisfactory to express the composition of the solutions employed in terms of the amount of the constituents actually used in their preparation. Thus if a solution is stated to be 1.8N in nickel sulphate, 0.2N in nickel fluoride and 0.5M in boric acid, it was prepared by treating an amount of hydrofluoric acid equivalent to a final concentration of 0.2N, with an excess of nickel carbonate, and after all reaction had ceased, by adding the requisite amount of boric acid. This mixture was added to the nickel sulphate solution, and thoroughly mixed. After standing for several hours, the solution was filtered. By this method of preparation the solutions were made as nearly neutral as possible, as they were at all times in contact with nickel carbonate and nickel hydroxide. This procedure was employed at first because it was desired to obtain solutions containing no other metal than nickel. As will be explained later, it is far simpler to prepare solutions by the use of sodium fluoride, which solutions are very similar in behavior to those made from nickel fluoride.

METHODS OF ANALYSIS

For satisfactory experimentation or commercial application of plating solutions, it is essential to have reliable methods of analysis. In solutions containing nickel, fluorides and boric acid there is no difficulty in determining the nickel content by the usual electrolytic methods. The estimation of fluorine and of boric acid is, however, very difficult, and at present we know of no entirely satisfactory methods for fluorine, and no methods whatever for the boric acid in such solutions.

The determination of fluorine by precipitation as calcium fluoride is at best a tedious method, owing to the difficulty of retaining the calcium fluoride upon a filter. If calcium carbonate, or, as has recently been proposed, calcium oxalate,¹⁰ is precipitated along with the calcium fluoride, the precipitate may be retained on a filter, but the filtration and washing still require a long period. In order to apply such a method to the plating solutions

it would be necessary to remove the sulphate, and moreover the presence of boric acid would cause uncertainty in the composition of the final precipitate. These difficulties were found to be so great that after numerous attempts the gravimetric estimation of fluorine in these solutions was abandoned.

Approximate results have been obtained by a simple volumetric method which was first proposed by A. Greef.¹¹ It depends upon titration of the neutral fluoride with standard ferric chloride solution, which forms a precipitate having the formula Na_3FeF_6 analogous to cryolite. In order to repress the solubility of this salt, sodium chloride is added in large excess. Sodium sulphocyanate is used as the indicator and a layer of ether is employed to extract and concentrate the ferric sulphocyanate formed when the ferric chloride is present in slight excess. The end point is reached when a permanent faint pink color is produced in the ethereal layer. The details for the application of this method to nickel solutions have not yet been perfected, but the indications are that the method will be sufficiently accurate for plant control.

ESTIMATION AND CONTROL OF ACIDITY

Of even greater importance than the determination of the major constituents of a nickel-depositing solution are the estimation and control of the acidity, or, more strictly speaking, of the hydrogen ion concentration of the solution. In nickel deposition in general and especially in the accurate reproduction of engraved plates, the most common difficulties encountered are "pitting" and "cracking" or "curling." Even though there may be other contributing factors, it seems reasonably certain that the principal cause of such defects is excessive acidity of the solutions, or at least excessive liberation of hydrogen at the cathodes. In discussing the cause of pits it is necessary to distinguish between them and projections, which latter are usually initiated by the presence in the solutions of suspended conducting particles such as nickel and carbon derived from the anodes. Before any really conclusive evidence can be obtained, however, as to the cause and prevention of pitting and cracking, means must be secured for measuring and controlling the acidity of such solutions.

The hydrogen ion concentration of a solution may be expressed directly in the following form: $(\text{H}^+) = 10^{-x}$; which signifies that the actual concentration of hydro-

gen ions in the solution is $\frac{1}{1,000,000}$ normal. In order to avoid the use of the negative exponent, S. P. L.

Sørensen¹² employed the $\log \frac{1}{(\text{H}^+)}$ to which value

he applied the expression p_H . Thus in the above case $p_H = 6$. In using this method of expression it is necessary to bear in mind that a large numerical value for p_H represents a low hydrogen ion concentration or acidity, and *vice versa*. A detailed discussion of methods of measuring and expressing the hydrogen ion concentration will be found in a recent book by W. M. Clark.¹³

METHODS OF TESTING ACIDITY OF SOLUTIONS

Various methods for testing the acidity of nickel-plating solutions have been proposed and employed to

advantage in plant control. The simplest is the testing of the solution with litmus and congo-red papers, which, it is frequently claimed, should both be turned pink by a solution in good operating condition—i.e., the solution should be acid to litmus and alkaline to congo-red. In measurements depending upon the actual titration of nickel solutions the most common indicator thus far employed is sodium alizarin-sulphonate. A solution is said to be satisfactory if a given sample requires a certain amount of acid or of alkali to produce a neutral (or some definite) tint with this indicator.

These two methods illustrate the measurement of two distinct factors in the acidity of such a solution—viz., the intensity and the quantity factor. The first method measures, at least roughly, the hydrogen ion concentration; the second determines the amount of acid or of alkali required to produce some definite hydrogen ion concentration. Either method may be useful, but both are necessary to a complete understanding of the behavior of such a solution during operation.

APPLICATION OF HYDROGEN ION MEASUREMENTS

The application of hydrogen ion measurements should prove very valuable in determining not only the optimum range of acidity for nickel deposition, but also the possible function of various additions, such as fluorides and boric acid, in regulating this acidity. In such measurements it is important to determine not alone the p_H of solutions of certain composition, but also the rate at which the p_H changes upon the addition of acid or alkali, since this rate determines the degree to which the solution will automatically compensate for any variation in anode or cathode efficiency. So far as acidity is concerned, the ideal nickel-plating solution is one which will within the desired working range have a relatively flat neutralization curve; in other words, it should be a well "buffered" solution. Much work remains to be done on this subject, as it will require the laboratory study of many solutions and the correlation of such results with the operation of corresponding baths over long periods. The observations thus far made by us are distinctly preliminary.

Since the hydrogen ion concentration of these solutions appears to be directly related to their behavior upon electrolysis, attempts were first made to measure this property by means of the hydrogen electrode. Even with pure nickel sulphate solutions, however, the results were not consistent or reproducible. Frequently values would be obtained which appeared to be definite, but with another electrode appreciably different values were secured. The results were still less reliable when the commercial plating solutions were thus tested. This latter difficulty is probably attributable to the presence in commercial solutions of small amounts of copper, iron or arsenic, which may "poison" the electrodes. The difficulty with pure nickel sulphate cannot be readily explained. The only conclusion that could be reached from hydrogen electrode measurements conducted at different times during the past several years is that normal nickel sulphate solution has a p_H value between 6 and 7—i.e., the hydrogen ion concentration (H^+) is between 10^{-6} and 10^{-7} —and that satisfactory plating solutions have a p_H value between 4 and 6.

"DROP METHOD" TEST FOR HYDROGEN ION CONCENTRATION

More satisfactory results have been obtained by measuring the hydrogen ion concentration with indicators,

using the "drop method" as proposed by L. J. Gillespie¹⁴ and also described in detail by W. M. Clark.¹⁵ In this method, instead of preparing hydrogen ion standards by the use of buffered salt solutions, tubes containing different fixed proportions of the given indicator in its acid and alkaline form are placed in pairs so that the color observed by transmitted light is that of a partly transformed indicator, corresponding to some known p_H . When the test solution is colored as with nickel solutions, it is necessary to include in each series of standards a third tube containing the nickel solution. A definite quantity of indicator is then added to a separate portion of the nickel solution, two tubes containing water are placed in series with it, and the resultant color is matched against the indicator color standards as above prepared. The indicators which have been found most useful in measurements upon nickel solutions are bromphenol blue, and bromcresol purple, which together cover the range involved—i.e., $p_H = 3.5$ to 7.0. At first methyl red appeared to be well suited for this purpose, since it is very sensitive in the region from $p_H = 4.0$ to 6.0; but careful measurements showed that

FIG. 1. HYDROGEN ION AND NEUTRALIZATION CURVES OF NICKEL SOLUTIONS

Based on colorimetric measurements upon 50 c.c. of solution. Initial composition:

- A: $NiSO_4 - N$.
B: $NiSO_4 - N$; $H_3BO_3 - 0.5M$.
C: $NiSO_4 - N$; $H_3BO_3 - 0.5M$; $HF - 0.1N$.

in nearly neutral nickel solutions anomalous results are obtained with this indicator, presumably because of some specific salt effect. Preliminary observations with indicators show that the p_H of normal nickel sulphate solutions is about 6.8, and that the addition of even very minute amounts of acid causes a great increase in acidity, that is, a decrease in p_H .

In Fig. 1, A is a typical "titration curve" of nickel sulphate—i.e., it represents the changes in hydrogen ion concentration produced by successive additions of acid or of alkali. This curve, based on measurements with indicators, has the same shape and approximately the same position as one which was obtained with the hydrogen electrode; in the latter case, however, the readings were somewhat uncertain and erratic. The large

¹⁵"The Determination of Hydrogen Ions," by W. M. Clark (Williams & Wilkins, 1920).

effect upon the hydrogen ion concentration produced by the addition of small amounts of sulphuric acid to nickel sulphate solutions indicates clearly why it is not practicable to deposit nickel from a solution containing only nickel sulphate, as even slight deficiency in anode corrosion will result in such a large increase in hydrogen ion concentration as to cause a low cathode efficiency and a poor deposit. Bennett¹⁶ and his associates found that the cathode efficiency in a "neutral" nickel ammonium sulphate solution was low, but that by the addition of small amounts of ammonia to the solution the cathode efficiency approached 100 per cent. They did not, however, make any measurements of the change in hydrogen ion concentration thus produced.

The effect of boric acid in maintaining a uniform slight acidity of a nickel bath is shown in Curve *B* of Fig. 1. Let us assume, as a first approximation, that a satisfactory nickel bath should have a p_H between 4 and 6 (actually the range may be much narrower). By comparison of curves *A* and *B*, it is seen that in 50 c.c. of a normal nickel sulphate solution it requires less than 0.5 c.c. of $N/5NaOH$ to change the p_H from 4 to 6, whereas, in the solution containing boric acid it requires about 2.5 c.c. of the alkali to produce the same change in p_H . This observation confirms the conclusion of L. D. Hammond¹⁷ that the principal function of boric acid in nickel baths is the maintenance of a uniform low hydrogen ion concentration. Upon reversal of the neutralization process—i.e., the addition of acid to a solution made slightly alkaline with sodium hydroxide—a curve of similar shape is obtained. If, however, nickel hydroxide has been actually precipitated by the alkali, there is a certain "lag" in its solution by the acid, which causes the solution at any stage to be more acid (a lower p_H) than corresponds to the true equilibrium. This lag is very much less if boric acid is present than in the simple nickel sulphate solution.

Curve *C* of Fig. 1 illustrates the effect of the addition of alkali to a nickel solution containing both hydrofluoric and boric acids. It is apparent that the reaction is complicated and that considerable further study will be required to explain the significance of each part of the curve. It is evident, however, that the solution is "well buffered"—i.e., the p_H does not change as rapidly upon the addition of alkali as it does in the pure nickel sulphate solution or in that containing only boric acid. To produce the same change as above considered—viz., $p_H = 4$ to 6—it requires about 10 c.c. of the 0.2*N* alkali—i.e., four times as much as in the solution with boric acid, and over twenty times as much as in pure nickel sulphate solutions. Whether this marked regulating effect of the fluorides or fluoborates is the principal cause of their effect upon the structure of the deposits must be determined by more exhaustive experiments.

It is significant that in all three curves the p_H at the point where nickel hydroxide begins to precipitate (and beyond which the p_H changes very slightly until all the nickel is precipitated) is about 6.8—i.e., nearly the same as the neutral point of nickel sulphate. This shows that when these solutions are neutralized by agitation with nickel hydroxide, they all reach the same degree of neutrality. A few experiments indicate that the same p_H is obtained by neutralizing the solutions with nickel carbonate.

EXPERIMENTS UPON THE OPERATION OF SOLUTIONS

Most of the experiments upon these solutions were carried out at the Bureau of Standards. Observations were also made upon solutions in operation at the Bureau of Engraving and Printing. Small-scale experiments were conducted in glass battery jars containing from 1 to 10 liters and in stoneware tanks with a capacity of about 30 liters. Within short periods there was practically no etching of the glass or stoneware by the solutions containing fluoborates. For continuous operation it is probably best, however, to line stoneware vessels with a bituminous coating, since it has been found that when lead fluoborate solutions are kept in stoneware for a year or more there is decided etching. For factory operation of these solutions both the stoneware and wooden tanks have been lined with bituminous material. There is no appreciable contamination of the solutions when kept in chemical glassware during analysis.

For purposes of comparison the fluoborate baths were usually run in series with a nickel bath similar to that recommended by O. P. Watts,¹⁸ but in order to permit a ready comparison between the function of the chlorine and fluorine, Watts' formula was slightly modified to yield definite normalities. See Table I.

TABLE I. FORMULA OF "CHLORIDE" SOLUTION. BATH NO. 2

		g/L	Oz./Gal.
Nickel sulphate.....	1.8 <i>N</i>	255	34
Nickel chloride.....	0.2 <i>N</i>	24	3.2
Boric acid.....	0.5 <i>M</i>	31	4.2

Corresponding "fluoride" baths were prepared, of which, however, the compositions are not strictly equivalent to that of the chloride bath, since, as previously noted, some nickel hydroxide separates out upon mixing nickel fluoride and boric acid. The constituents actually used in their preparation are shown in Tables II-A and II-B.

TABLE II-A. FORMULA OF "FLUORIDE" SOLUTION

		g/L	Oz./Gal.
Nickel sulphate.....	1.8 <i>N</i>	255	34
Nickel carbonate ¹⁹		12	1.6
Hydrofluoric acid ¹⁹ (50 per cent HF).....		8	1.1
Boric acid.....	0.5 <i>M</i>	31	4.2

TABLE II-B. FORMULA OF "FLUORIDE" SOLUTION

		g/L	Oz./Gal.
Nickel sulphate.....	2.0 <i>N</i>	281	37.5
Sodium fluoride.....	0.2 <i>N</i>	8.4	1.1
Boric acid.....	0.5 <i>M</i>	31	4.2

The solution given in Table II-A is prepared by adding the hydrofluoric acid cautiously to the nickel carbonate which has been previously mixed with water to the consistency of a thick cream. After effervescence ceases, the boric acid, first dissolved in warm water, is added, and the entire mixture is then added to the solution of the nickel sulphate. After thorough mixing the solution is filtered or allowed to settle.

The solution given in Table II-B is prepared simply by dissolving the three constituents in water. By using warm water, solution occurs more rapidly.

A few preliminary experiments were made with nickel fluoborate without sulphate and with solutions containing 50 per cent of the nickel as fluoborate and 50 per cent as sulphate; but the deposits obtained were less satisfactory than those with the above solution in which approximately 10 per cent of the nickel is present as fluoborate. Most of the studies were therefore

¹⁹Equivalent to 0.2*N* nickel fluoride.

conducted with the latter solutions. A few experiments with solutions containing only nickel sulphate and nickel fluoride yielded unsatisfactory deposits.

In general the solution to be studied was run in series with the "chloride" bath and with a copper voltameter (coulometer). In most cases deposition was produced upon polished steel plates which had been treated with sodium sulphide solution to permit subsequent separation of the deposited nickel.

Where physical tests of the deposits were to be made, the steel plates were surrounded with a shield of insulating material ("Formica") which served to reduce the current density and thickness over the entire surface.

Through use of a shield it was also possible to employ entire higher average current densities than

The results obtained upon relatively thick specimens (about 0.75 mm. or 0.03 in.) are given in Table IV.

TABLE IV. PHYSICAL PROPERTIES OF DEPOSITED NICKEL

Expt.	Solution	Current Amp./ sq.dm.	Density Amp. sq.ft.	Ultimate Tensile Strength		Elongation in 2 in. (5 mm.) per cent
				Kg./sq cm.	Lb. sq in.	
1	Chloride No. 2	1	9	4,900	75,000	
2	Chloride No. 2	3	28	4,900	75,000	8.5
3	Chloride No. 3	5	47	5,600	80,000	11.0
4	Fluoride No. 3	1	9	7,000	100,000	
5	Fluoride No. 3	3	28	8,200	117,000	2.4
6	Fluoride No. 3	5	47	9,350	133,000	4.8

Accurate determination of the yield points was not found possible, but the few results obtained indicate that there is less difference in the yield point than in the ultimate tensile strength of the nickel from the two solutions. The data in Table IV show that there is a

otherwise, as under ordinary conditions the edges receive an excessive current density and become cracked or "burnt."

Unless otherwise noted, commercial "95-97 per cent" cast nickel anodes having an area approximately equal to the cathodes were employed. An analysis of one lot of these anodes²⁰ yielded the results given in Table III.

TABLE III. COMPOSITION OF NICKEL ANODES

	Per Cent

In a few cases commercial anodes having almost the same composition, except that they contained 0.6 per cent of tin, were used, with no apparent difference in the operation of the baths.

PHYSICAL PROPERTIES OF DEPOSITED NICKEL

As our immediate interest was in securing deposits which would withstand severe abrasion, greater attention was paid by us to the physical properties than to the appearance of the deposits. Pending the development of a satisfactory method for measuring hardness, and especially the "abrasion hardness" of thin layers of metal, a few preliminary tensile tests were made²¹ upon the assumption that the results would at least indicate the relative hardness of samples of similar material.

²⁰By J. A. Scherrer, of this bureau.

²¹By L. B. Tuckerman, of this bureau.

great difference in the ultimate tensile strength of the deposits from the chloride and fluoride solutions, which difference is most marked in deposits produced at relatively high current densities. This difference can be readily observed by manual bending of the samples, when it will be found that the fluoride deposits are much stronger and more elastic than the chloride.

It has not been possible to secure any absolutely conclusive evidence of the relative wearing qualities (e.g., on a printing press) of the two grades of nickel, but all the evidence secured confirms the superiority of the fluoride deposit for this purpose.

That this difference in physical properties is accompanied by differences in crystal structure is evident

TABLE V. COMPOSITION OF DEPOSITED NICKEL

	"Chloride" Per Cent	"Fluoride" Per Cent

from Fig. 2, from which it will be seen that the deposit from the fluoride is much finer grained than that from the chloride solution.

One of the most characteristic differences in the operation of baths containing chlorides and fluorides is the fact that much sludge is produced in the chloride solution, while the fluoride remains practically clear. Under these conditions we would expect a higher content of metallic impurities in the fluoride deposit than in the chloride, in fact the presence of such impurities has

been suggested as a cause of the finer crystal structure and higher tensile strength of the fluoride deposit. Analysis of the deposits²² yielded the results shown in Table V.

Even though there is a greater content both of copper and iron in the fluoride deposit (approaching closely that present in the anodes), it is at least doubtful whether these amounts of impurities could account for the difference in structure and physical properties, especially since they are present in at least comparable amounts in the chloride deposit. Further experiments are needed to determine whether the effect of the fluorides or fluoborates is specific, or whether similar effects may be produced by other substances.

EXPERIMENTS WITH HOT-ROLLED AND ELECTROLYTIC NICKEL ANODES

In view of the good anode corrosion in the fluoride solutions, and the almost complete absence of sludge, a few attempts were made to employ either hot-rolled or electrolytic nickel anodes.²³ These experiments indicated that the fluoride solution corrodes the rot-rolled anodes about as readily as it does the cast anodes, but that the corrosion of the electrolytic anodes is poor until the solution becomes so acid that a very low cathode efficiency is secured. Further work will be required to determine whether the commercial use of rolled anodes in these solutions will prove practicable and economical.

The rolled anodes used in these experiments had the composition given in Table VI.²⁴

In both the chloride and fluoride solutions it was found that the cathode efficiency for current densities up to 2 amp. per sq.dm. (19 amp. per sq.ft.) is above 99 per cent. At higher current densities the cathode efficiencies are slightly lower in the chloride than in the fluoride solutions. It is possible to use higher current densities in the fluoride than in the chloride solutions, without producing appreciable cracking or curling of the deposit. Thus on polished brass plates about 6 x 9 cm. (2.5 x 3.5 in.) good adherent deposits were obtained from both solutions at an average of 2 amp. per sq.dm. (19 amp. per sq.ft.), while at 4 amp. per sq.dm. (37 amp. per sq.ft.) the deposit from the fluoride was almost perfect, and that from the chloride was badly curled. These data are of only relative value, however, as the actual current density upon the edges, where cracking first occurred, was certainly much higher than the above values. The deposits referred to in Table V as secured at a current density of 5 amp. per sq.dm. (47 amp. per sq.ft.), were rendered possible only by the use of the shields.

As for the immediate purpose in view it was necessary to use wax for insulating purposes, the use of solutions at appreciably elevated temperatures was prevented. All of the experiments herein described were made with solutions at room temperature (20 to 25 deg. C., or 68 to 77 deg. F.). The effects of bath temperature upon the deposits will be included in the further investigations now in progress.

CONDUCTIVITY OF PLATING SOLUTIONS

One of the important factors in the operation of plating solutions is the conductivity, because an increase in conductivity not only represents an economy in power, but also leads to the production of smoother de-

posits. In this respect the fluoride solution as above prepared is slightly inferior to the chloride as shown by the data in Table VII based on approximate measurements at 25 deg. C. (77 deg. F.).

TABLE VII. RESISTIVITY OF NICKEL SOLUTIONS		
No.	Composition	Resistivity Ohms per Cm. Cube
1.....	NiSO ₄ 2.0 N.....	20.5
2.....	NiSO ₄ 1.8 N NiCl ₂ 0.2 N H ₃ BO ₃ 0.5 M	19.8
3.....	NiSO ₄ 1.8 N NiF ₂ 0.2 N H ₃ BO ₃ 0.5 M	21.9
4.....	NiSO ₄ 1.8 N NiF ₂ 0.2 N H ₃ BO ₃ 0.5 M Na ₂ SO ₄ 0.5 N	17.2
5.....	NiSO ₄ 1.8 N NiF ₂ 0.2 N H ₃ BO ₃ 0.5 M MgSO ₄ 0.5 N	20.9
6.....	NiSO ₄ 2.0 N NaF 0.2 N H ₃ BO ₃ 0.5 M	19.9

Efforts were therefore made to increase the conductivity by the addition of sodium sulphate and magnesium sulphate respectively. It is interesting to note (Table VII) that the sodium sulphate has a greater effect upon the conductivity than has an equivalent amount of magnesium sulphate, though the change produced by this concentration of either is not sufficient to represent any great economic advantage. Unfortunately, there is no prospect for the development of a good nickel-depositing solution with a resistivity comparable with that of the acid copper bath (about 5 ohms per cm. cube).

A few experiments with solutions corresponding to Nos. 4 and 5 in Table VII showed that good deposits could be secured in them, within about the same range of current density, as in No. 3. No physical tests were made upon the deposits, but from simple bending tests they appeared to be somewhat "softer" than the deposits from No. 3. At the same time it was found that there was slightly less tendency for the deposits from Nos. 4 and 5 to crack and curl up than for the deposits from No. 3. The advantages observed were not sufficient, however, to justify a definite recommendation to add these "conducting salts" to the solution.

One of the chief objections to the use of solutions prepared like No. 3 is the danger and inconvenience of handling hydrofluoric acid. In our later experiments, therefore, a bath was prepared according to the formula of No. 6 (Table VII). The substitution in No. 3 of sodium fluoride for nickel fluoride, with the addition of an equivalent amount of nickel sulphate, should produce a solution exactly similar to that which would be secured by adding 0.2N sodium sulphate to No. 3. The value for the conductivity of such a solution and its behavior upon electrolysis indicates that such is the case. This bath has not been used by us on a commercial scale for so long a period as has No. 3, but the results thus far obtained are sufficiently promising to recommend its further application. Apparently, the de-

²³Furnished for this purpose by the International Nickel Co.
²⁴Analysis by J. A. Scherrer.

posits are slightly softer than those from No. 3, which may cause somewhat less resistance to abrasion. On the other hand, such deposits may be preferable in electroplating because they are more readily buffed. A bath of this character has been used by us for miscellaneous plating for a few months, and has given entirely satisfactory results.

CONCLUSIONS

When nickel or sodium fluoride is added to nickel baths containing boric acid, fluoborates more complex than those corresponding to the formula HBF_4 are probably produced. The fluorine content of such solutions can be determined approximately by titration with ferric chloride.

The effect of boric acid and hydrofluoric acid upon the hydrogen ion concentration and neutralization curve of nickel sulphate solutions has been studied, and their function in plating solutions has been suggested.

Nickel deposits produced in solutions containing fluorides have a finer structure and a higher tensile strength than those produced in corresponding chloride solutions. When prepared with anodes containing about 97 per cent of nickel, there is slightly more iron and copper in the fluoride deposits than in the chloride.

The anode corrosion in solutions containing fluorides

is good and the solutions produce less sludge than do corresponding chloride solutions. Attempts to use electrolytic anodes in such solutions at reasonably high current densities have not yet been successful, but the results with hot-rolled anodes are promising.

The use of fluorides in nickel solutions for electrotyping will probably increase the wearing quality of the printing surface. In electroplating, good deposits can be secured in the presence of fluorides at somewhat higher current densities than are ordinarily employed, and these deposits, while slightly harder to buff, show greater resistance to abrasion.

The use of the solution given in Tables II-A and II-B is suggested. These solutions may be used with an average current density of from 3 to 4 amp. per sq.dm. (28 to 37 amp. per sq.ft.) for producing adherent deposits in electroplating and 1.5 to 2 amp. per sq.dm. (14 to 19 amp. per sq.ft.) for making reproductions, as in electrotyping.

ACKNOWLEDGMENT

The author desires to express his appreciation for the assistance of his associates at the Bureau of Standards, especially W. E. Bailey, L. D. Hammond, H. E. Haring and M. R. Thompson, in conducting the experiments described in this paper.

Recent Chemical & Metallurgical Patents

American Patents

Complete specifications of any United States patent may be obtained by remitting 10c. to the Commissioner of Patents, Washington, D. C.

Coke-Oven Charging Car and Means of Discharging Smoke.—JOHN BECKER of Pittsburgh, Pa., has patented an improved device for charging coke ovens which also provides an effective means for taking care of the smoke ordinarily escaping into the open air at the time of charging. The charging car shown in the accompanying drawing permits the coking chambers of a battery of ovens to be charged independently of each other while at the same time the openings of the ovens are collectively connected to a fixed smoke main extending longitudinally along the battery. The smoke

incidental to the charging operation is conveyed from the coking chambers 11 through the openings 12. The charging car, consisting of the four funnel-shaped hoppers 24, can be moved across the several batteries of coking chambers on the tracks 18. The hoppers are normally closed by a slide located at the top of the chute 27. The smoke flue 29 is carried with the truck, and its branches 31 extend into the sides of the chutes. The action of recharging consists briefly in connecting the smoke flue with the main and then lowering the sleeves 28. The coal, which is charged from one or more

of the hoppers, causes the smoke to be delivered out of the other charging openings into the smoke flue 29 (1,376,313, April 26, 1921.) Another patent (1,376,314, April 26, 1921) provides a means for discharging the smoke into a gas-collecting main so that, if desired, the byproducts carried along with the gas can be recovered.

Process of Treating Brass Scrap.—OLIVER C. RALSTON has discovered that aluminum, iron and other metals which are electropositive to copper can be removed from brass scrap and related copper-bearing alloys by treating these materials with an aqueous solution of cupric chloride or with a weak hydrochloric acid solution into which chlorine gas is introduced. Starting with a brass scrap containing 35 per cent of zinc and 0.2 per cent of iron, the contents of these metals were reduced to 10 per cent and 0.05 per cent respectively, and the total loss of the charge did not exceed 48 per cent. (1,375,930; April 26, 1921.)

Refractory Material.—Carborundum refractory articles can be made satisfactorily by using a bonding material composed of zirconium and aluminum silicates. Carborundum constitutes at least 80 per cent of the mixture, which is held together by a bond consisting of 9 parts of zirconium silicate to 1 part of aluminum silicate. The principal advantages possessed by this bonding material are the long and higher vitrification range and its desirable surface reaction with the carborundum. (1,376,091; MINER L. HARTMANN, of Niagara Falls, N. Y., assignor to the Carborundum Co.; April 26, 1921.)

Alloys for High-Speed Tools.—Alloys consisting essentially of chromium, tungsten, cobalt, carbon and iron have been found to be especially useful for the manufacture of lathe tools and other instruments operated at great speed. These alloys, it is claimed, possess the requisite qualities of toughness, hardness and ductility in a high degree and would therefore be preferred to alloys which are so hard as to be brittle and easily broken or which are so soft that they will not withstand the great pressure under which they are operated. (1,376,056 and 1,376,062; JOHN F. WANDERSEE, ROBERT PERETTO, and THEODORE ALBRECHT, assignors to the Ford Motor Co.; April 26, 1921.)

Production of a Ferro-Silico-Magnesium Alloy.—An alloy to be used as a deoxidizing agent is prepared by adding magnesium to ferrosilicon, which has been heated to a semi-fluid state. Aluminum, nickel or other metals may be alloyed with magnesium and used as a substitute for it, provided they are added to the ferrosilicon in the same

manner. (1,376,113; GUSTAV PISTOR, ALBERT BEIELSTEIN, and ADOLF BECK, assignors to the Chemische Fabrik Griesheim-Elektron of Frankfort, Germany; April 26, 1921.)

Nitrogen Fixation Process.—A method is proposed for producing compounds such as ammonia and the oxides of nitrogen by gas reactions within an electrolytic cell. Advantage is taken of the activity of electrolytic oxygen and hydrogen by bringing nitrogen into intimate contact with them at the time of their liberation. This is accomplished by the use of porous anodes and cathodes into which a stream of nitrogen is forced. (1,376,207; CHARLES B. JACOBS, assignor to E. I. du Pont de Nemours & Co. of Wilmington, Del.; April 26, 1921.)

British Patents

For complete specifications of any British patent apply to the Superintendent British Patent Office, Southampton Buildings, Chancery Lane, London, England.

Calcium Superphosphate.—A soluble calcium phosphate or a manure containing it in admixture with potassium sulphate is prepared by calcining alunite and passing the gaseous products into a tower or chamber containing phosphate with or without calcined alunite, water spray or steam being added if necessary. The calcination of the alunite may be effected in a closed retort at 700-900 deg. C. or in a furnace in which it descends over a number of hearths, the lower ones being externally heated to 700-900 deg. C. The reactions are completed on storing the product. According to the provisional specification, the gases arising from the calcination of alunite may be led over calcined alunite for the production of aluminum sulphate and alum; and a fertilizer containing soluble phosphate and potash is obtained by calcining as above described a mixture of alunite and insoluble phosphate. (Br. Pat. 158,293; A. MATHESON, London. April 13, 1921.)

Gas Producers.—In the continuous distillation of carbonaceous material by passing therethrough streams of hot gas, the volatile products are collected in a chamber provided with one or more outlets for gases, vapors and liquid distillates. The fuel may be fed continuously to the preheating chamber *B* of a producer provided with a grate *K* at the base, and ash is discharged continuously by a screw *G*. The producer gas passes into a distributing chamber *A* and through a louvered partition *D* into the fuel. The gases, etc., escape through a second partition *C'* into the collecting-chamber *L*, which may be divided by shelves *P* to fractionate the products. In one modification, three concentric chambers are used, and in another form, the producer is separated from the distillation chamber. (Br. Pat. 158,394; W. P. PERRY, London. April 13, 1921.)

Dyeing Cellulose Acetate.—In dyeing fibers, threads or fabrics of cellulose acetate, the material is treated with ammonium thiocyanate prior to dyeing, or ammonium thiocyanate is added to the dye-bath. Instead of ammonium thiocyanate, sodium, potassium, calcium, etc., thiocyanates may be used. Examples are given of dyeing with acid wool dyes, basic dyes, substantive cotton dyes, and vat dyes. Mixed goods containing cellulose acetate and cotton, wool, silk, etc., may be treated by the process, either by cross-dyeing or by using a dye which the two fibers absorb in the presence of the thiocyanate. (Br. Pat. 158,340; BRITISH CELLULOSE & CHEMICAL MANUFACTURING CO., LTD., Westminster, and J. F. BRIGGS and C. W. PALMER, both of Spondon, near Derby. April 13, 1921.)

Catalytic Iron.—Pure iron, which is useful as a catalyst for the synthesis of ammonia, is prepared by treating ferric nitrate solution with just sufficient silver nitrate to precipitate any chloride present, filtering, evaporating the solution to dryness, partly converting the nitrate into oxide by gentle ignition, washing out the residual nitrate together with any oxidized sulphur product, and finally reducing the ferric oxide. An inert support, such as pumice or asbestos, may

be added just prior to ignition; and a promotor may be incorporated with the catalyst by adding ammonium molybdate, potassium osmate, titanium nitrate, uranium nitrate or an alkali tungstate, to the purified ferric oxide before reduction. The product is preferably heated in pure ammonia gas. (Br. Pat. 159,960; NITRO-FIXATION SYNDICATE, LTD., and H. C. JENKINS, London, May 4, 1921.)

Gas Density Estimating Apparatus.—The density of a gas is determined by rotating a solid body in a chamber containing the gas and causing the current of gas thus set up to act on a second movable solid body which operates an indicating device. In the form shown in Fig. 1 the rotating member *W* is disposed in the chamber *G*, which also contains the member *M*, which is displaced by the gas current. The latter

member is mounted on a shaft *m* to which a pointer, etc., is connected. The form shown in Fig. 2 comprises two similar chambers *K*₁, *K*₂ respectively containing the gas to be tested and the standard gas such as air. The rotating parts are connected by gearing *r*₁ . . . *r*₄ so as to turn at equal speeds in opposite directions. The shafts *m*₁, *m*₂ carry arms *H*₁, *H*₂ connected by a link *Z*, and a pointer on the arm *H*₁ indicates the relative densities of the gases. (Br. Pat. 159,845; not yet accepted; G. KONIG DAHLEM, Berlin, May 4, 1921.)

Dust Collectors.—Relates to apparatus for separating dust from air and gases and of the type in which the separation is effected in stages within a vessel containing a conical hood, the air impinging upon the inner surface of the hood and having its direction changed and its velocity reduced as it passes through the vessel, and consists in the provision of additional conical hoods, within the vessel. As shown, the air-inlet pipe *b*, Fig. 1, communicates with the interior of the container *a* having an air outlet *c* which may be connected with a suction device, and a dust outlet *d*. A conical hood *e*

closed at its lower end encircles the inlet pipe, and a hood *f* having a conical depending skirt *f'* is fitted at the upper and open end of the hood *e*. Baffle-plates *i*, *j* are provided within and at the lower portion of the skirt to reduce the velocity of the air. In a modification, the cover at the lower end of the hood *e* is replaced by a dust-pipe extending through the lower portion *a'* of the container and closed by a removable cap. In another arrangement, the inlet pipe *b*, Fig. 2, is tapered, and the air current entering the container is subdivided by a hood *k*, having an open and upwardly extending central portion which communicates with a hood *e*. The subdivided air currents pass through passages formed in the container by means of hoods *f*, *n*, and finally unite before leaving. (Br. Pat. 160,100; R. BOBY, LTD., and M. JENNINGS, Bury St. Edmunds. May 11, 1921.)

Synopsis of Recent Chemical & Metallurgical Literature

Length Changes at Transformation Points.—Simple experiments showing the dilation of steel wires have been described by J. LEMOINE and M. GARVIN in *Revue Générale des Science*, April 15, 1920, p. 194. The accompanying figure shows schematically the results they have obtained. A 3.5 m. long, 1.5 mm. diameter nichrome wire was swung in a horizontal position between two supports and a 110-volt current passed through it. The wire elongates on heating so as to give a 25-cm. deflection. On cooling the wire regains the original horizontal position. A hard steel (piano) wire 1.2 mm. in diameter when treated in the same way expands during heating up to a deflection of about 15 cm. corresponding to the temperature of dark red, then

DIAGRAM SHOWING LENGTH CHANGES IN WIRES AT THEIR TRANSFORMATION POINTS

contracts a length corresponding to about 10 cm. deflection and finally elongates to about 20 cm. deflection at a temperature of cherry red. During cooling the wire contracts to a temperature below visible color, when it shows the phenomenon of recalescence and finally regains the original length. This experiment shows the well-known lag in transformation. A chromium-tungsten steel wire of the composition of high-speed tool steel, 3 m. long and 1.2 mm. in diameter, also gives instructive results. During heating a phenomenon similar to that for hard steel is observed, but at the temperature of bright red. During cooling two transformation points are observed. With slow cooling there would be only one transformation point corresponding to the first one at *a*; with rapid cooling there would also be only one, but this would correspond to that at *b*.

Research in Ceramic Decorative Processes.—The May *Journal* of the American Ceramic Society contains a clear analysis by FREDERICK H. RHEAD covering the fundamentals of research in ceramics. These fundamentals as outlined by Mr. Rhead consist of adequate resources, not only financial but mental and physical, which contribute to the success of the undertaking; a clearly defined purpose or program; efficient direction, experienced practical assistance, an adequate and well-planned equipment, and finally, educational facilities.

It will be generally conceded that the ideal condition will be that where the manufacturer and research director are in harmony as to the specific purpose of the activity. With the final program determined, working drawings would be executed and actual samples would be made. A competent director will commence work with as little disturbance as possible endeavoring to fit into the organization as it exists, while giving it new impetus. In this country we have archi-

fects, artists, draftsmen, sculptors and decorators of international reputation, and there is no practical reason why their interest should not be aroused and their services utilized.

As regards efficient direction, a progressive manufacturer with a knowledge of industrial possibilities should have little trouble in finding men capable of formulating and directing a program for the specific purpose in mind. The fact of the matter is that the average business man is afraid of the artist; calls him a freak; balks at his so-called temperament, entirely unconscious of the fact that the average business man is the most temperamental man in the world.

The art director and the director of artistic research must be an efficient executive with a sound knowledge of business principles, and the work of his department must be subject to the same rational business treatment and scrutiny and the same discipline accorded to the other branches of the activity.

It has just been stated that one man could not successfully carry out the work under discussion. An organization for the manufacture of artistic clay products may be compared to the symphony orchestra. Personal experience has shown that 35 per cent of the art director's time is spent in instruction. But it pays. An interested and enthusiastic working force is worth any amount of attention.

Speaking of adequate educational facilities, it might be suggested that the American Ceramic Society hold conventions where the program includes the general public. The various manufacturers would submit examples of their product; the school, examples of students' work. As far as possible each exhibit would be accompanied with a detailed classification of the process when school children are dabbling in pottery, when independent organizations such as the Apprentice Schools of Design and the Art Alliance are active in this direction. It is evidence of interest which could profitably be co-ordinated with the interests of the manufacturer.

If the American Ceramic Society is to establish a proper influence in the clay-working industry, the members as a body would be rationally sympathetic to those closely allied industries which in turn must be educated to an intelligent understanding of the tremendously important work being done by present-day industrial clay-working organizations. The work would be helped tremendously in this society if it were possible, at future conventions, to have a meeting of the heads of the various divisions. The decorative men need the assistance of the technicians, and both these groups cannot work without the practical men. And last, the manufacturer is an official whose attendance is absolutely necessary if the American Ceramic Society is to get very far with its program.

Recrystallization in Aluminum.—Prof. CARPENTER and Miss ELAM read a paper before the spring meeting of the British Institute of Metals on "Stages in the Recrystallization of Aluminum Sheet on Heating." They ascribe Brislee¹ and Anderson's² inability to detect crystalline structure in rolled aluminum to the fact that they examined the surface of the sheet. When cut, polished, etched and examined crosswise, laminar markings typical of drawn-out crystals were found. On reheating such sheet a long time at 220 deg. C., first evidence of structural change is shown in a general surface tarnish, a granular structure and a loss of definition at the original grain boundaries. After seventeen hours at 250 deg. C. and correspondingly shorter times at higher temperatures new white crystals appear at the old boundaries. Structural equilibrium attained after prolonged heating at such low temperatures gives crystals elongated in direction of rolling and showing high contrast in tarnish hues, the ones to grow first from less impure solid solutions having the lighter tones. Long heating at 450 to 600 deg. C. gives crystals less elongated and having but slight tarnish contrasts. Supplementary experiments on slightly worked 82:18 Al:Zn and α brass showed recrystallization in every case to start at grain boundaries, along twinning planes or in contact with a speck of insoluble impurities.

Current Events

in the Chemical and Metallurgical Industries

Stanley Patent Bill Being Pushed

Every effort is to be made to obtain the prompt enactment by Congress of Senator Stanley's bill amending the Revised Statutes relative to patents which will require manufacture within continental United States of any article covered by a patent granted a foreigner.

In recommending the legislation to the Senate, the Committee on Patents pointed out that the War Department noticed in April that a large number of applications of patents were being filed by Germans. Many of these have been assigned to various German companies, including that of Krupp at Essen. An investigation by the War Department of 228 of these applications which related to ordnance disclosed the fact that all were assigned to the Krupp company.

The Secretary of War approves the legislation in that it prevents foreigners from obtaining United States patents for the sole purpose of protecting them against American manufacture of the articles covered by such patents. Secretary Weeks points out that under the present law foreigners enjoy the same protection and monopoly as to patent rights as do American citizens. In cases where patented articles are fully protected by the United States patents, it is of little consequence how high an import duty is placed on articles manufactured under such patents in foreign countries, since they are not manufactured in the United States and are necessary to the carrying on of our industries and must be imported regardless of the high tariff.

Secretary Weeks believes that the Stanley bill insures the foreign holder of the patent a reasonable return on his invention and at the same time insures the United States a domestic source of the product.

Gas and Fuel Symposium Planned

The processing of fuels and the chemistry of gas making will receive special attention at a symposium which is planned as a part of the New York meeting of the American Chemical Society next October. Plans for this occasion are just being perfected through the Division of Industrial and Engineering Chemistry of the society. C. H. Stone of the Rochester Gas & Electric Corporation will be chairman and R. S. McBride, engineer-chemist, Colorado Building, Washington, secretary of this session. The committee to work with these officers is soon to be designated by the division so that comprehensive plans may be formulated during the summer. Chemists and engineers interested in the project or having suggestions regarding papers which should form a part of the program should communicate with the secretary of the symposium. It is thought that a gas and fuel section of the A.C.S. may be formed as an outgrowth of this work, so that more attention may be given to the chemistry of fuels processing than is possible through the engineering and commercial organizations which are active in this field.

Scholarship to France for Wisconsin Engineer

A scholarship in the Metallurgic and Mining Institute of the University of Nancy, France, has been recently established for a University of Wisconsin student of engineering. The donor is Mme. K. de Billy, who established the scholarship in memory of her late husband, Edouard de Billy, a mining engineer and formerly French high commissioner to the United States. The scholarship is for 4,000 francs and is open to any student who has completed three years of engineering work and can pass the requirements for the University of Nancy. Unless a Wisconsin student qualifies the scholarship goes to some other American university.

Industrial Alcohol Legislation

The Committee on Rules of the House of Representatives was prepared at the time of this writing to report out a rule assigning a definite time for the consideration of the Volstead bill, to which manufacturers of industrial alcohol have taken exception. The Committee on the Judiciary, which reported out the bill, has insisted strenuously on its prompt consideration. Some displeasure has been indicated because the Committee on Rules did not act more promptly.

It is understood that the rule under contemplation will not preclude the offering of amendments on the floor of the House. If the House should vote down amendments looking to the liberalization of the control over industrial alcohol, the possibility of alterations by the Senate still exists.

The new prohibition commissioner has been sounded out and is known to be keenly aware of the necessity of placing no unnecessary obstacles in the way of the manufacture and use of industrial alcohol for non-beverage purposes. This is regarded as a very hopeful feature of the situation, since any law that may be enacted will leave a great deal to the discretion of the prohibition commissioner.

Du Pont Dye Plant Increases Production

The American dye industry is slowly recovering from the recent depression. Operations in the large dye works of E. I. du Pont de Nemours & Co. at Deepwater Point, N. J., are back on a six-day-a-week basis. This change went into effect on June 13 and applies to all departments in the plant. At the same time the management reduced the wages of all employees from 7 to 15 per cent. Salaries were reduced about 15 per cent when the bonus was discontinued on Feb. 1. Some of the older and more experienced operators, who have been out of work for several months, are being re-employed.

In most departments production is confined to dyes that the company has not hitherto manufactured, as the stocks on hand of the older staples are sufficient to meet the demand. In several instances special efforts are being made to manufacture those dyes for which the War Trade Board has issued import licenses. Until these dyes are manufactured in this country, it can hardly be said that the dye manufacturers are meeting all the demands of the dye consumers.

TNT Not Highly Sensitive

That TNT is not highly sensitive and is perfectly safe for industrial uses is a statement contained in a formal announcement by the Bureau of Public Roads. The announcement was prompted by the recent explosion of a bomb attached to an airplane at the Aberdeen Proving Grounds. Many of the reports of that accident conveyed the impression that TNT is a very sensitive explosive. The bureau points out that it has been distributing TNT to the state highway departments in large quantities for more than a year to be used for blasting purposes in highway construction and that during that entire period not a single accident has occurred. The Bureau of Public Roads points out that the accident at Aberdeen gives splendid proof that TNT is not a highly sensitive explosive. There were four 300-lb. TNT bombs attached to the airplane when the propeller struck the 50-lb. bomb which exploded. These bombs were intended to explode by impact. The force of the blow from the propeller was sufficient to detonate the one bomb but the explosion did not detonate the four 300-lb. bombs.

The success attending the use of TNT in road construction has led the bureau to undertake the distribution of picric acid, which is available in large quantities, to be used for land clearing.

Atlas Powder Company to Produce Refining Carbon

Many attempts have been made in the past sixty years to produce an efficient substitute for bone-char used in the refining of numerous products such as sugar, glucose, maltose, lactose, vegetable oils, gelatine, glue, alcohol products and other chemicals and pharmaceuticals. While the need for such a refining carbon has been growing more and more urgent, these attempts have not been commercially successful. Now after several years of research and tests, the Atlas Powder Co., Wilmington, Del., has drawn plans for a 6,000-ton plant to manufacture "Darco," a decolorizing and refining carbon which will be put on the market at a price to compete successfully with all other refining materials.

The principal reasons necessitating a bone-char substitute have been the constantly increasing price of this carbon of animal origin, due to the growing demand and inadequate supply. Refining carbons have been imported, but these expensive carbons cannot be used on a large scale without revivifying many times. Revivification has so far not been an easy and cheap process because of the considerable loss due to the large percentage of volatile fines contained.

The advantages claimed for "Darco" are that it is twenty-five to thirty times as efficient as bone-char, is rapid in action, and that it is so cheap that it may be used two or three times and then be discarded without the need of revivifying. There are no royalty charges added to its cost.

Heretofore chemists have focused their attention on particular raw materials from which decolorizing carbons were to be made, such as cinchona bark, rice hulls, corncobs, hydrolized wood waste, kelp, etc. While some of these carbons looked promising in the laboratory stage, the low yield in final product from the raw material and the cost of carbonization and subsequent washing made commercial production prohibitive. On the other hand the idea has also been proved mistaken that any kind of carbonaceous waste material, such as, for instance, the molasses residue in the manufacture of alcohol or the waste liquor in the paper pulp industry, would produce commercially efficient decolorizing carbon. The theory that any finely divided carbon would make a good decolorizing agent has not worked out.

This new development is the first attempt in this country by a large and well-known chemical manufacturing concern, such as the Atlas Powder Co., to undertake the manufacture of a decolorizing carbon. Because of the importance of efficient decolorizing, deodorizing and refining carbons in a large number of chemical industries, this project is receiving wide interest.

Fixed Nitrogen Laboratory to Be Transferred

The Fixed Nitrogen Research Laboratory will be transferred on June 30 from the War Department to the Department of Agriculture. With the laboratory the War Department will transfer the remainder of its appropriation for this type of research. The amount is approximately \$500,000.

The laboratory will be an independent unit of the Department of Agriculture and will be under the direction of Dr. Richard C. Tolman, who has been conducting it for the War Department. Dr. Tolman will report directly to the Secretary. He will have the assistance of an advisory committee to be made up of representatives of the agricultural bureaus having immediate interest in nitrogen matters.

Plans are being made so that the present appropriation will be sufficient to maintain the laboratory for two years.

Plastic Gypsum Commercially Available

Plastic gypsum made in accordance with the Bureau of Standards recommendations is now available commercially according to announcements. The principles on which this process were based were recently described in *CHEMICAL & METALLURGICAL ENGINEERING*¹ by Warren E. Emley, who discovered and has patented the improvements which make possible the preparation of calcined gypsum in a valuable plastic condition. Other companies are also reported to be building mills for the production of this product.

¹CHEM. & MET. ENG., vol. 24, p. 740, April 27, 1921.

Federal Regulation of Fertilizer Opposed

Senator Fletcher, of Florida, has presented to the Senate a resolution by Southern Commissioners of Agriculture protesting against federal regulation of the "sale and shipment of fertilizer in interstate and foreign commerce, to prevent the adulteration and misbranding thereof."

The resolution recites that it was actuated by the introduction of a bill in Congress to that end. This assumption is in error, however, as no bill has been introduced at this session of Congress which attempts such regulation of the fertilizer traffic. The Bureau of Soils frequently is accused of harboring an earnest desire for such legislation. The charge has been made that it takes advantage of the requests of Congress for information as to the fertilizer situation to bring forward arguments which make good propaganda for such legislation. So far as can be ascertained, however, Congress is not entertaining at this time any serious intention of legislation looking to federal regulation of fertilizers. There is some difference of opinion as to the effect on the fertilizer industry of the control which is proposed to exercise over the packers.

Obtaining Copies of Scientific Articles

Many scientists lack the library facilities which their work demands. They are compelled either to journey to distant libraries or to try to borrow books by mail. Often it is difficult for them to locate something that is badly needed, and again it may be impossible to borrow it.

The Research Information Service of the National Research Council is prepared to assist investigators by locating scientific publications which are not generally or readily accessible. It will also, as is desired, have manuscripts, printed matter or illustrations copied by photostat or typewriter. The cost of copying varies from 10c. to 25c. per page. No charge is made for this service unless an advance estimate of cost has been submitted and approved by correspondent. Requests for assistance should be addressed to National Research Council, Information Service, 1701 Massachusetts Ave., Washington, D. C.

Chemical Exhibit a Success

Members of Congress are practically unanimous in commending the chemical exhibit which was displayed in the office building of the House of Representatives by the National Research Council. The exhibit now has been moved where it will be on permanent display. The National Research Council has prepared a copy which is available for exhibition at any point throughout the country where there may be a demand for it.

Representative Longworth declares that members of Congress obtained more information concerning the chemical industry in a half hour at the exhibit than they would have received if they had read volumes.

Stamford Chemical Society Visits Testing Plant

On the afternoon of June 11 a party of members of the Stamford Chemical Society visited the research laboratory and small testing plant of Joseph H. Wallace & Co., at Webb's Hill, on the outskirts of Stamford, Conn. Interesting talks were given by Mr. Wallace, Mr. Greenwood and their research chemist, Mr. Stevens, on all phases of their process for producing high-grade paper pulp material with turpentine, fine oil and rosin as byproducts from the stump-wood of the Southern pine.

The process involves steaming the properly-sized wood chips for recovery of the turpentine and pine oils, treatment of the steamed chips with a fraction of the pine oils that has been found to be a good solvent for extraction of the rosin, and a steam distillation of the extract to recover the rosin and solvent. The treated chips then have a uniform composition and are in an ideal condition for transfer from the field plant to the paper pulp mill and treatment there with the mixed caustic soda and sodium sulphide solutions according to the regular routine of the sulphate process which is recommended by J. H. Wallace & Co.

A strong, high-grade paper can be uniformly produced by this method.

New Chemical and Oil Companies

During the month of May twenty-four companies with capitalization of \$50,000 or more were organized to manufacture chemicals, drugs, dyes and affiliated products. The total authorized capital of such corporations amounts to \$12,400,000, as compared with an indicated investment of \$9,390,000 for companies formed in this line in April. A year ago, May, 1920, the amount of capital involved in new companies in the chemical field totaled only \$3,392,500. During May, 1921, only two of the companies chartered had an authorized capital of \$1,000,000 or larger. For the first five months of the present year a total of \$62,300,000 in capitalization is shown in new companies formed to manufacture chemicals and affiliated products.

During the same month of May, 102 companies with a capital of \$50,000 or larger were organized to operate in different branches of the petroleum industry. The total capitalization is \$112,925,000, or the smallest aggregate for any month of the present year. During the preceding month, April, 110 companies were formed, with total authorized capital of \$227,470,000, while in May of a year ago 160 such concerns were organized, with an aggregate capitalization of \$200,350,000. Five companies were formed during May, 1921, with an authorized capital of \$10,000,000 or larger.

Ruling Scale by Light Waves

It is interesting to note that it is now possible to construct scales for the measurement of length directly from the fundamental wave lengths of light without the use of any intermediary standard. As an example of work of this sort which is now being regularly carried out, it may be mentioned that the Bureau of Standards recently completed the rulings on a 6-in. scale using light waves from a tube containing neon (wave length 5800 to 6600 Å) as the length standard. The work was done for the Brown & Sharpe Manufacturing Co.

Potash Outlook for 1921

Potash stocks in the United States are estimated by the Potash Producers Association to have been 50,000 tons K_2O on April 1. The 1920 consumption of fertilizer is given as 7,500,000 tons, a record for the industry. Figuring 3 per cent as the average potash content of 1920 fertilizer, 225,000 tons of K_2O was used. With lower fertilizer prices likely to prevail this fall and with the farms of the country still under-fertilized as a result of war shortages, a much larger consumption of potash in 1921 is predicted.

Would Modify Pulp-Wood Restrictions

All probabilities favor the ultimate passage of the Senate resolution providing for the naming of a commission to confer with the Canadian authorities in the hope of obtaining modifications of the Canadian restrictions on the export of pulp wood to the United States. These restrictive orders were made after the American mills had acquired pulp-wood holdings and rights in Canada.

Exposition at Portland, Ore.

Another step has been taken by way of preparation for the International Exposition to be held in Portland, Ore., in 1925. The Senate has passed a bill authorizing the President to invite foreign countries to participate in the exposition. The exposition is intended to celebrate the completion of the transcontinental and Pacific highways, the centennial of the invention of the electromagnet and to exemplify the development of hydro-electric energy.

Aluminum Solders

All tests on recent aluminum solders have been completed by the Bureau of Standards and circular 78, "Solders for Aluminum," will now be revised to include these tests. In spite of claims made by those interested, no solder for aluminum has yet been found which will withstand the corrosion test, although the fused zinc chloride solders withstand corrosion for the greatest length of time.

Patent Office Bill to Be Reported Out

Representative Lampert's bill providing for increased salaries in the Patent Office is to be reported out in the near future. It is known that there is no opposition to the measure in the committee. Prompt action by the House is expected. This bill failed at the last session because of the insistence on the part of Senator Norris, then the chairman of the Senate Committee on Patents, that the Senate decline to recede from its amendment which authorized the Federal Trade Commission to administer patents for Government employees.

Georgia Kaolins to Be Studied

The Georgia kaolins are to be the subject of a special study to be undertaken by the Bureau of Mines under a co-operative agreement with the Central of Georgia R.R. These white clays of Georgia have been used with some success in ceramic industries, and it is believed that means can be found for a very much more extensive use of them if economical methods can be found of ridding them of impurities.

Administration of War Minerals Relief Act

In all probability the administration of the war minerals relief act will be lodged in the future in a single individual. It is understood that Secretary Fall has tendered this position to Ira E. Robinson, of Grafton, W. Va. It is Secretary Fall's desire to wind up the settlement of all war minerals claims at the earliest possible moment. Since most of the work in this connection has been done, he believes that it will be unnecessary to continue the commission form of administration.

Reclaiming of Foundry Sands

A co-operative study of the problems encountered in the reclaiming of foundry sands is to be made by the Bureau of Mines and the American Foundrymen's Association.

Mme. Curie Given 50 Milligrams of Mesothorium

During the recent visit of Mme. Curie in Philadelphia she was presented with 50 milligrams of mesothorium by the Welsbach Company.

Book Reviews

A METALLOGRAPHIC STUDY ON TUNGSTEN STEELS, by Axel Hultgren. John Wiley & Sons, Inc., New York, 1920. Pp. 95; illustrated. Price, \$3.

This book is unusual in character in that it covers work which is ordinarily presented at meetings of technical societies or in technical journals. It describes the results of investigation of the transformations and structures of a number of tungsten steels under varying heat-treatments. There is, in addition, an appendix which comprises a critical review of the investigation of tungsten steels by Honda and Murakami,¹ but it is to be regretted that the original text was not rewritten following the author's first knowledge of these Japanese investigations.

The solubility of tungsten in austenite was found to be limited to certain tungsten proportions which decreased as the carbon content increased. Beyond this limiting composition there appeared a special constituent which, in the case of alloys carrying carbon corresponding to cast iron, was cementite; in high-carbon steels of over 0.7 per cent carbon, WC, but a metastable double carbide Z_2 appeared if stable conditions were not reached; in steels containing less than 0.7 per cent carbon, a double carbide designated Z_1 ; in low-carbon alloys, an iron tungstide.

It was found that Ar_1 in these alloys was raised approximately 10 deg. C. for each per cent tungsten and that the

¹This work was reviewed in CHEM. & MET. ENG., April 27, 1921, pp. 745-748.

eutectoid composition of the austenite was displaced toward lower carbon contents by about 0.05 per cent for each per cent tungsten. The pearlite transformation was retarded and this mechanical mixture was observed to be finer than that in carbon steels.

The lowering of the pearlite transformation on cooling from high temperatures (stabilization of the austenite) was marked and with certain combinations of composition, initial temperature and rate of cooling this change is entirely suppressed. So-called secondary ferrite was precipitated from the stabilized austenite at relatively low temperatures (providing the rate of cooling was not too slow) at temperatures of the low critical range found by earlier investigators.

A number of other conclusions are drawn and the relation of free carbides to magnetic properties of tungsten magnet steels is discussed and there is given a tentative Fe-W-C equilibrium diagram.

Presenting, as it does, the views of an investigator who has spent much time in the study of carbides in steels, the text should be of interest to anyone interested in the theory of a variety of commercial steels in which tungsten is an essential component.

H. J. FRENCH.

* * *

A FRENCH-ENGLISH DICTIONARY FOR CHEMISTS.

By *Austin M. Patterson*, Ph.D. 384 pp., New York: John Wiley & Sons, Inc. Price \$3.

Chemists who have had occasion to use Dr. Patterson's "German-English Dictionary for Chemists" will welcome the arrival of this sister volume. The earlier book has proved itself an able assistant to the many readers, old and young, of scientific chemical German. The new volume, following the same general plan, promises to prove just as valuable to those who delve into *Comptes-rendus* or *Annales de Chimie*. French chemical literature, to be sure, covers a considerably smaller field than the German and to the beginner, at least, its translations offer fewer difficulties. There are, however, as the author points out, many obstacles such as idiomatic constructions and irregular verbs which can, at times, prove most troublesome. For the novice's benefit the introduction of the book contains many notes on chemical nomenclature and word derivations which should prove helpful in the use of the vocabulary. Our eccentric friends, French verbs, are appropriately introduced in a brief statement by Prof. Frank Vogel, of the Massachusetts Institute of Technology. The new dictionary is of convenient size and shape and its flexible green binding makes it easy to distinguish it from its German companion.

SIDNEY D. KIRKPATRICK.

Personal

CHESTER M. CLARK, formerly head of the corporation department of the constructing engineering firm of Stone & Webster, Boston, has recently been chosen treasurer of Arthur D. Little, Inc., Charles River Road, Cambridge, Mass.

Dr. C. E. CURRAN, formerly with the Mead Development & Engineering Co., Dayton, Ohio, is now at the Forest Products Laboratory.

J. R. DAVIES, for the past seven years in charge of the laboratories of the Calumet Baking Powder Co., Chicago, has been appointed assistant plant manager and chemical manager of the chemical works of the Calumet Baking Powder Co., Joliet, Ill.

Dr. G. J. FINK, formerly with the Hooker Electrochemical Co., Niagara Falls, is now associated with Dr. M. E. Holmes in the chemical department of the National Lime Association at Washington, D. C.

Captain WALTER GRAHAM has resigned from Government service at Washington, after making investigations of raw materials and blast furnace and steel works practice for the Fuel Administration, Army Ordnance Department, Bureau of Standards and the U. S. Tariff Commission, and

has moved to New York to engage in examination and reports on coal, iron and steel properties and operations. Captain Graham's present address is care of the Harvard Club, New York.

ROY A. HAYNES has been appointed the new federal prohibition commissioner to succeed John F. Kramer.

Dr. MAX HENIUS of the Wahl-Henius Institute, Chicago, Ill., has left for a visit to Denmark and northern Europe.

RICHARD LEWIS LLOYD, of the Dwight & Lloyd Sintering Co., Inc., was honored at the recent commencement of Washington University, St. Louis, with the degree of Master of Science. In conferring the degree Chancellor Hall referred to Mr. Lloyd as "A distinguished metallurgist, product of training in mining and metallurgy at this university in the early '90s; associated with important metallurgical processes; identified with many movements in smelting, especially copper smelting, where he had been instrumental in perfecting new methods in North and South America and in European countries; sharer in developing the well-known Dwight & Lloyd sintering apparatus; author of technical papers for engineering and mining journals and for technical societies."

RICHARD R. REES has resigned as metallurgist of the Neptune Meter Co. to accept a similar position with Neemes Bros., Inc., of Troy, N. Y.

Dr. RALPH E. RINDFUSZ, assistant to the president of the American Writing Paper Co., has been elected secretary of the company to succeed Michael N. Slotnick, resigned. In addition to his new duties as secretary, Dr. Rindfusz will continue as assistant to the president and will also retain general supervision of the department of chemical research, which will remain under the direct capable management of Dr. L. E. Roberts.

IRA E. ROBINSON, of Grafton, W. Va., has accepted the appointment to be war minerals relief commissioner. He already has entered upon his duties and is making a thorough review of the status of war minerals relief. Horace G. Pomeroy, a member of the commission under the preceding administration, has consented to remain in the service that he may be of any possible help to Mr. Robinson in acquainting him with the status of various matters pertaining to the commission's affairs. His resignation, however, will become effective June 30.

Current Market Reports

The Chemical and Allied Industrial Markets

NEW YORK, June 20, 1921.

The past week has witnessed a slowing down of the recent increased activity in heavy chemicals. The more important items have been subject to irregular periods and the movement has reflected the cross-currents which characterize the consuming trade. The market fundamentally is very much brighter, as stocks in resale quarters have diminished without any corresponding increase in production. There were instances uncovered where spot stocks were actually scarce and advances have occurred where buying orders were executed. In most cases, however, buyers experienced some difficulty in obtaining supplies at apparently attractive prices. Various chemicals that have come under the license system have advanced and the general belief that others may be placed under that classification has prevented short selling and has tended to steady prices. Consumers still prefer to adhere to the conservative policy which has been so effective for the past year and most of the transactions have been limited to small lots. Trading of this caliber does not help conditions any too much and indicates that consumers are not reconciled to the idea that the market has touched bottom.

The decline in exchange rates has put a damper on any hopes of an early revival in export trade. The exchange has been keenly watched by leading chemical interests and

its peculiar action has caused considerable comment. There are many opinions expressed in chemical circles, but none seems really to understand the fundamental reason for the decline. Undoubtedly one of the principal factors is the position of speculators in foreign exchange. In January, 1921, sterling sold down to \$3.35 and then had a steady advance to \$4 in April. During this period a great amount of speculative buying of foreign moneys occurred in expectation of an early settlement of the German indemnity question. Now these speculative purchases are probably being liquidated. It is said that German bankers established over \$300,000,000 of credits in various countries when marks rose to a high level with the prospects that these credits could be used in the indemnity settlement that would eventually come. Now it is reported that Germans are transferring these credits into dollars and as a result are selling all exchanges. Still another important factor in the demoralization of sterling is the drawing down of foreign balances by American banks. There is a great deal of confusion in the foreign exchange market, but no apparent uneasiness and no evidence of any alarm.

IMPORTS

Imported soda ash has not been in as much demand as heretofore. Buyers have gradually eased up purchasing this commodity through fear of delayed shipments resulting from the general abnormal conditions in England. Some material was known to have been sold for July shipment, but under present conditions sellers are not pushing any new business. The placing of oxalic acid in the "synthetic organic chemical" list requiring a license for import has steadied that commodity and prices have been well sustained around the point recently established at the late advance. Odd lots of this material arriving rather late are held in bond and are a cause of great concern to holders. There were rumors current in trade circles that prussiate of soda was being placed on this license list and this had a steadying effect on values. There is enough caustic potash in dealers' hands both of domestic and foreign manufacture to keep prices rather irregular. Quinine, camphor and menthol have been quite firm of late and more confidence is expressed regarding prices. There have been no new reports of any imports of chlorate of soda and prices have ruled firm. Imported tartaric acid has shown its weak spots on account of lack of buying support.

DOMESTIC INQUIRY INCREASES

The domestic inquiry has shown a slight increase over the preceding week without resulting in any appreciable expansion in business. Basic prices on soda ash and caustic soda are lower, while the resale markets on both materials are stronger, with higher prices named generally on caustic. It is stated that producers have been placing more business recently. Small-lot trading in bichromate of soda has increased, with prices favoring sellers. Nitrite of soda seems to be in a more favorable position for an advance than at any other time this year. The greater portion of supplies is in hands that are not inclined to liquidate. It seems reasonable to assume that after carrying stocks for several months and now protected from foreign competition, buyers will pay higher prices when they attempt to replenish stocks. Business in general throughout the spring has been rather spotty and so far business during June has not been as good as in previous months. The probability is that the slowness is temporary and within a few weeks will have vanished. Manufacturers and dealers are looking forward beyond the immediate present and expect fall business to be active.

CHEMICALS

Resale lots of 76 per cent *caustic soda* of standard brand sold at \$4.15 per 100 lb. ex-warehouse N. Y. and it is doubtful if more than odd lots could be purchased below this figure. Outside makes were quoted at 4c. per lb. The export price for standard resale material is given at 4½c. per lb. Actual business was quiet, but offerings were rather limited and had a tendency to hold the market steady. Producers quoted contracts at 3½c. per lb., basis 60 per cent f.o.b. works, and 5c. per 100 lb. higher for single cars.

Higher prices were quoted for imported *prussiate of soda* on spot, and sales were recorded at 12½c. per lb. The former price of 12½c. was refused on firm bids in several directions. The demand for small lots was quite active and there are rather persistent rumors that this chemical will eventually be placed by the Treasury Department under the classification requiring license to import. Some sellers refuse to shade 2½c. per lb. on less than carlots for light *soda ash* in single bags ex-store. It is stated that cars could be purchased at \$2.15@2.20 per 100 lb., although the market looked decidedly firm under a continuance of light supplies. Resale lots in barrels are quoted at \$2.50@2.75 per 100 lb. according to quantity. Inquiries for home and export were quite numerous, with buyers always a trifle below sellers' views. Producers of *copper sulphate* have advanced their prices on a stronger copper market and are now quoting small crystals on a basis of \$5.62 per 100 lb. in carlots and large crystals at \$5.75 per 100 lb. Imported *citric acid* is quoted at 46c. per lb. spot, duty paid, with intimations that this price might be shaded on a firm offer for a round lot. The tendency of the market, however, has been firmer of late and it is asserted that holdings have been reduced through recent quiet buying. The general range was 46@47c. per lb.

Prominent sellers of *copperas* report a fair inquiry, with actual business rather spotty. Sales have been made at \$19@21 per ton, depending entirely upon grade, quantity and seller. Producers of *niter cake* are offering this chemical on a basis of \$5 per ton in bulk at the works. The call of late has been quiet and it is understood that a moderate accumulation of supplies exists. Sales of *oxalic acid* during the week were reported at 19@19½c. per lb., with some sellers quoting up to 20c. per lb. for prime material ex-warehouse. The tone of the market remains quite firm and many are convinced that any permanent buying movement would be readily reflected in the course of values. Producers of *sulphuric acid* state that contracts for the 66 deg. are being placed at prices ranging from \$18@20 per ton in tank cars f.o.b. works, the inside figure being named for large quantities. It is also stated that sales of the 60 deg. have been made down to \$11 per ton, although sellers as a rule are not eager to quote under \$11.50 for tank cars at the works. Sales of *oleum* are reported at \$21@23 per ton in tank cars. A good miscellaneous call for industrial purposes is reported, although new business has not shown any added activity since the turn of the month. Stocks of *muriate of potash* are quite heavy and holders are pretty well tired. Quotations are around \$50 per ton, but buyers have experienced no difficulty in finding lots at \$49 or even less. German *caustic potash* in the spot market is offered lower around 5@5½c. per lb., with shipment material offered at even lower figures. The demand is very slow and holders are willing to shade for sales. Shipment from Germany can probably be had as low as 4½c. per lb. Resale American material is pretty well cleared out of the market.

Quotations on the spot market for *fluoride of soda* are around 11½@13½c. per lb., according to seller and quantity. A marked increase in the purchases of Japanese refined *camphor* has been noted in the market during the week. Sales went through at 67, 68 and 70c. per lb. and the market then moved to 72c. for slabs in cases. Some sellers are bullish in their ideas and are quoting 74@75c. per lb. Small packings are held at 82@85c. per lb. Spot stocks are reported to be materially reduced. American refiners still adhere to the 80c. basis for bulk *camphor in barrels*. *Bromides* are in fair routine request. Prices are easy at 16@18c. per lb. for imported *potassium bromide*. *Sodium bromide* is held at 21c. per lb. with a greater interest from some consumers reported. American makers are holding *potassium bromide* at 24c. and *sodium* at 25c. per lb.

COAL-TAR PRODUCTS

The better tone in the coal-tar products market has kept up pretty well throughout the past week and is largely due to the gradual improvement in operations in textile mills, for reports in general have shown a better demand from actual consumers in domestic quarters, while from foreign

directions the demand shows a marked increase. Many of the more prominent sellers talk in a more cheerful tone and while shading is still possible in some quarters on firm business, prices all around are more firmly held. Business in dyes has been slowly improving and as a consequence intermediates are generally firmer. Producers of intermediates say there is a much wider call and some of the lesser active issues are also starting up and prices are noticeably stronger. Several comparatively strong resellers have shown an inclination to take up the weakest of the spot offerings in many items, especially *beta naphthol*. Prices throughout the market are firmer on this account coupled with the improved feeling among consumers. The situation in *benzene* has shown no change, but consumers are showing less interest. Makers' prices are unchanged at 27@33c. per gal. in tank cars and less, although they are able to offer only a little at these figures. Resellers have limited quantities to offer on the open market. The 90 per cent grade is quoted unchanged at 25@28c. per gal. The resale market in *naphthalene* was very quiet, with stocks still offered below 8c. per lb. Makers' prices are still unchanged. Most producers of H acid are quoting \$1.25 per lb., although offers from one source are heard lower at \$1.20 per lb. Buyers have virtually no interest and it is probable that as low as \$1.10 could be done with a firm order in hand. Technical *salicylic acid* is still in a weak position. Offers are heard around 19c. per lb., although some makers are quoting up as high as 22c. per lb. In the resale market offers of the U.S.P. are heard as low as 20c. per lb. Recent offers of *aniline oil* from resellers have been withdrawn to a great extent from the market and efforts to locate resale stocks were unsuccessful during the week. Makers are keenly competing for such business as comes into the market and price cutting is quite general. Quotations are given at 20@27c. per lb., according to maker, but it is known that no maker would turn down any real business at the 20c. level. The market on *beta naphthol* is quite firm at 38@40c. per lb., according to seller. Weak resale lots are being taken up by stronger holders and any business that has come into the resale market from consumers has met a firm price of 38c. per lb. Manufacturers' prices are quoted at 40@42c., but it is possible that they will meet the resale market at its present level.

WAXES

Trading in the market for *beeswax* was along routine lines, but with stocks practically light no selling pressure was in evidence and prices rule steady. African crude held at 16½@17c. per lb. Brazilian crude was offered at 24@26c. per lb., according to color, quantity and holder. Imports of beeswax in April were officially placed at 82,871 lb., which compares with 957,816 lb. for April a year ago. Imports for the ten months ended with April amounted to 1,909,735 lb., as against 3,205,102 lb. for the corresponding period a year ago. An unsettlement in shipment prices featured the market in *carnauba wax* and with supplies on hand more plentiful and the demand rather slow consumers showed no apprehension over the near future. No. 2 North Country was lowered on spot to 25c. per lb. Freer offerings of spot *Japan wax* sent prices to somewhat lower levels, and at the close the market stood at 17@17½c. per lb., round lot basis. Primary markets showed no important changes in the last week according to importers. The demand in general is quiet. Offerings of *montan wax* were noted at 6½@6¾c. per lb., the situation being easier on increased holdings. On forward business it was possible to do 5¾c. per lb. The decline in the export demand for *paraffine wax* is the principal cause in the unsettlement of prices. The domestic inquiry also remained subnormal and selling pressure has resulted in quite some price slashing, especially where round lots have been involved. According to official figures the exports of paraffine refined and crude for the month of April amounted to 9,939,611 lb., which compares with 35,874,485 lb. for April a year ago. Crude wax was offered at 2½@2¾c. per lb., according to melting point. Refined held nominally at 3¼c. per lb. for the 118-120 deg. melting point. There were sellers of the 130-132 deg. at 4¾c. immediate shipment, carlot basis.

The Chicago Market

CHICAGO, June 16, 1921.

Quieter conditions prevailed in the industrial chemical market during the past week and no large transactions were reported. Prices as a rule were quite firm with a few advances noted. Buyers are still averse to anticipating and what material that is moving is in small quantities for immediate consumption.

GENERAL CHEMICALS

Caustic soda is firm with spot supplies light. The solid 76 per cent is offered at 4c. and the ground at 4½@4¾c. per lb. delivered. *Soda ash* is very firm and holders show no disposition to shade the present price of \$2.60 per 100 lb. for barrels. *Aluminum sulphate* is in small demand and supplies are available at 2¼c. per lb. for ordinary lots. *Sal ammoniac* is firm and 8½c. per lb. was the best offer noted, while some factors are holding their supplies for 9c. *Barium chloride* is very quiet and ample supplies are available at \$75@\$85 per ton, according to the quantity. There is a fair demand for U.S.P. *epsom salts* and the price is unchanged at 3¼c. per lb. for barrels. *Formaldehyde* is dull and unchanged at 14½c. per lb. in barrels.

The *alcohol* market is extremely quiet, although as a rule prices are maintained. Denatured No. 6, 188 proof, is quoted by first hands at 33c. per gal. in five-drum lots and non-beverage 190 proof at \$4.85. Methyl alcohol is in limited request and holders are asking 80c. per gal. for the 95 per cent in drums.

Caustic potash is very unsettled and supplies of the 88-92 per cent are available at 7c. per lb. for single drums. This price could probably be shaded considerably with large business. *Potassium bichromate* is a little lower and small quantities are offered at 14½c. per lb. delivered. In contrast, *soda bichromate* is firmer and most holders have advanced their ideas to 9½c. for single casks. *Nitrite of soda* is very firm and 9c. per lb. was the lowest offer noted. There is a fair movement of *sodium bicarbonate* and prices are maintained at 2¾c. for barrels. *Glycerine* is in very poor demand and prices are easy with 15¾c. per lb. the lowest offer noted.

The list of acids is firm and quiet. The action of the War Trade Board strengthened the *oxalic acid* market and holders are now asking 20@21c. per lb. for first class goods. *Glacial acetic acid* is very quiet and the price is unchanged at 11@11½c. per lb., according to the quantity. Keener competition has forced the price on the 28 per cent material lower and supplies are available at 2½@2¾c. per lb. in barrels. The heavy acids are quiet with prices unchanged. Manufacturers quote 66 deg. *sulphuric* at \$19@\$20 per ton in tank cars f.o.b. works.

VEGETABLE OILS

This branch of the trade is very quiet, with little or no movement of stocks reported. *Linseed oil* is lower, with less than car lots held at 82c. per gal. for the boiled and 80c. for the raw.

NAVAL STORES

The leading factors describe this market as very slow with inquiries light. *Turpentine* is lower, with supplies available at 59c. per gal. in five-drum lots. There is practically no movement of *rosins* and the prices are unsteady. The WG is quoted at \$7.75 per 280 lb. for carload lots and \$8.75 for smaller quantities. *Rosin oil* is also quiet and easy at 60c. per gal. for single barrels.

The Iron and Steel Market

PITTSBURGH, June 17, 1921.

Each week the steel market shows that it is possible for it to become still duller. Since the slight increment in buying and in specifying against contracts that occurred in April there has been a progression downward in activity, and as July, proverbially the dullest month of the year in the steel market, is now close at hand, no revival in the very near future is expected.

The best guess as to the rate of steel ingot production

this week by the steel industry as a whole is that it is at about 23 per cent of actual capacity, with a probable error of one or two points either way, this comparing with rates slightly above 30 per cent in April and May. The present flow of orders and specifications is not sufficient to support such a production rate, so that further decreases are to be expected.

Mill costs are of course extremely high, on account of the very low operating rates. Many small plants have been closed for months, it being impossible to operate at all on the occasional orders that could be picked up. Larger mills make steel continuously at very low rates, or close steel-making departments entirely one or two weeks out of every three, finishing departments being operated as occasion requires. There will probably be some complete stoppages July 1, this being an old practice that became uncommon in recent years.

There is no prospect of steel demand increasing in the next few weeks, unless all precedents as to July being an exceptionally dull month are broken. The trade looks to the more distant future and in not a few quarters there are predictions that there will be a revival of some proportions in August. In other quarters it is doubted whether there will be any material improvement before October. Farmers are expected to become freer buyers after they have realized on their crops. The extreme inactivity of the railroads in the matter of making repairs and of buying all sorts of supplies is noteworthy and in some quarters there is a conviction that the railroads are carrying the policy too far for their own good.

STEEL PRICES

In the majority of steel products what are known as "April prices" continue to rule as the general market. One exception is wire products, which, as noted a week ago are down \$5 a ton. The market is altogether too dull to develop actual market prices, as there is scarcely any incentive to cut prices. It is the general belief that steel prices will be lower before there is anything like extensive buying, and the mills will hardly be averse to making reductions if more business can be obtained by such means.

The opinion apparently held by a majority of buyers, that there will be a general market decline by about Aug. 1, may, however, not be borne out. As to the extent of the decline, when a definite decline does occur, it is likely to be between \$5 and \$10 a ton. It would be idle to expect mills to reduce prices to the lowest level they may be able to reach in future, as they cannot get costs down as much as they can in a period of real activity. Using a weighted average of the prominent steel products, the April prices are about \$17 per net ton under the war control prices. Disregarding the advances made by independents in 1920, these advances coming off by the end of the year, there have been three general declines, in December, 1918, March, 1919, and April, 1921, not far from \$6 a ton each. A fair guess seems to be that the next decline will be as much or a little more. It must be remembered that there is such a gap between demand and productive capacity that the familiar course of the steel market can hardly be expected to be repeated, that course being for prices to decline to a low level, the mills to fill up and fall behind in deliveries and prices then to begin advancing.

PIG IRON AND COKE

Pig iron continues to show a declining tendency, but the yielding of prices is now very gradual, this being one of the indications that the market is beginning to scrape bottom. Basic iron is quotable at \$21 valley, against \$21.50 a week ago. Foundry remains at \$22.50 and bessemer at \$23.

Two contracts for Connellsville coke have been made in the past week, each for six or seven carloads a day, or 7,000 or 8,000 tons a month. One contract was with the Empire Steel & Iron Co., Catasauqua, Pa., for July, August and September at \$3 per net ton at ovens, the other being with the Colonial Iron Co., Riddlesburg, Pa., July to November inclusive, at \$3.15. The lowest contract price previously was \$3.25 or higher, several weeks ago, but for two or three weeks past the trade has understood that \$3 could be done on a short-term contract. Spot furnace coke has declined from \$3.25 to \$3.10 or \$3.15.

Sodium fluoride	lb.	.11 - .12	.12 - .13
Sodium hydroxide (caustic soda)	100 lb.	4.15 - 4.25	4.30 - 4.80
Sodium hyposulphite	lb.		.03 - .03
Sodium nitrate	100 lb.	2.90 -	3.00 -
Sodium nitrite	lb.	.07 - .07	.08 - .10
Sodium peroxide, powdered	lb.	.25 - .26	.27 - .30
Sodium phosphate, dibasic	lb.	.04 - .04	.05 - .05
Sodium potassium tartrate (Rochelle salts)	lb.		.26 - .27
Sodium prussiate, yellow	lb.	.12 - .12	.13 - .14
Sodium silicate, solution (40 deg.)	lb.	1.25 - 1.35	1.40 - 1.50
Sodium silicate, solution (60 deg.)	lb.	.02 - .03	.03 - .03
Sodium sulphate, crystals (Glauber's salt)	100 lbs.	1.50 - 1.75	2.00 - 2.25
Sodium sulphide, fused, 60-62 per cent (conc.)	lb.	.05 - .05	.06 - .06
Sodium sulphite, crystals	lb.	.03 - .04	.04 - .04
Strontium nitrate, powdered	lb.	.15 - .15	.16 - .17
Sulphur chloride, red	lb.	.07 - .07	.07 - .08
Sulphur, crude	ton	20.00 - 22.00	
Sulphur dioxide, liquid, cylinders extra	lb.	.08 - .08	.09 - .10
Sulphur (sublimed), flour	100 lb.		2.25 - 3.10
Sulphur, roll (brimstone)	100 lb.		2.00 - 2.75
Tin bichloride, 50 per cent	lb.	.18 - .19	
Tin oxide	lb.		.40 - .42
Zinc carbonate, precipitate	lb.	.16 - .18	.19 - .20
Zinc chloride, gran.	lb.	.11 - .11	.11 - .12
Zinc cyanide	lb.	.45 - .49	.50 - .60
Zinc dust	lb.	.12 - .13	.13 - .14
Zinc oxide, XX	lb.	.09 - .09	.09 - .10
Zinc sulphate	100 lb.	2.90 - 3.00	3.25 - 3.75

Coal-Tar Products

NOTE—The following prices are for original packages in large quantities:

Alpha-naphthol, crude	lb.	\$1.10 - \$1.15
Alpha-naphthol, refined	lb.	1.25 - 1.30
Alpha-naphthylamine	lb.	.35 - .40
Aniline oil, drums extra	lb.	.20 - .27
Aniline salts	lb.	.26 - .29
Anthracene, 80% in drums (100 lb.)	lb.	.75 - 1.00
Benzaldehyde U.S.P.	lb.	1.50 -
Benidine, base	lb.	.85 - 1.00
Benidine sulphate	lb.	.75 - .85
Benzoic acid, U.S.P.	lb.	.60 - .65
Benzoate of soda, U.S.P.	lb.	.65 - .70
Benzene, pure, water-white, in drums (100 gal.)	gal.	.27 - .32
Benzene, 90%, in drums (100 gal.)	gal.	.25 - .28
Benzyl chloride, 95-97%, refined	lb.	.28 - .30
Benzyl chloride, tech.	lb.	.20 - .25
Beta-naphthol benzoate	lb.	3.50 - 4.00
Beta-naphthol, sublimed	lb.	.70 - .75
Beta-naphthol, tech.	lb.	.38 - .40
Beta-naphthylamine, sublimed	lb.	1.75 - 1.80
Cresol, U. S. P., in drums (100 lb.)	lb.	.16 - .18
Ortho-cresol, in drums (100 lb.)	lb.	.25 - .27
Cresylic acid, 97-99%, straw color, in drums	gal.	.70 - .80
Cresylic acid, 95-97%, dark, in drums	gal.	.65 - .70
Cresylic acid, 50%, first quality, drums	gal.	.45 - .50
Dichlorobenzene	lb.	.06 - .09
Diethylaniline	lb.	1.20 - 1.25
Dimethylaniline	lb.	.41 - .50
Dinitrobenzene	lb.	.26 - .28
Dinitrochlorobenzene	lb.	.20 - .30
Dinitronaphthalene	lb.	.30 - .40
Dinitrophenol	lb.	.35 - .40
Dinitrotoluene	lb.	.27 - .30
Dip oil, 25%, car lots, in drums	gal.	.40 - .45
Diphenylamine	lb.	.60 - .65
H-acid	lb.	1.20 - 1.30
Meta-phenylenediamine	lb.	1.15 - 1.20
Monochlorobenzene	lb.	.12 - .14
Monoethylaniline	lb.	1.75 - 1.85
Naphthalene crushed, in bbls.	lb.	.07 - .08
Naphthalene, flake	lb.	.07 - .08
Naphthalene, balls	lb.	.08 - .09
Naphthionic acid, crude	lb.	.70 - .75
Nitrobenzene	lb.	.12 - .15
Nitronaphthalene	lb.	.30 - .35
Nitro-toluene	lb.	.16 - .18
Ortho-amidophenol	lb.	3.10 - 3.20
Ortho-dichlor-benzene	lb.	.15 - .20
Ortho-nitro-phenol	lb.	.80 - .85
Ortho-nitro-toluene	lb.	.15 - .20
Ortho-toluidine	lb.	.20 - .25
Para-amidophenol, base	lb.	1.50 - 1.60
Para-amidophenol, I Cl.	lb.	1.75 - 1.80

Para-dichlorobenzene	lb.	.15 - .20
Paranitroaniline	lb.	.85 - 1.00
Para-nitrotoluene	lb.	.85 - .95
Para-phenylenediamine	lb.	1.80 - 2.00
Para-toluidine	lb.	1.25 - 1.40
Phthalic anhydride	lb.	.50 - .60
Phenol, U. S. P., drums	lb.	.11 - .13
Pyridine	gal.	2.00 - 3.50
Resorcinol, technical	lb.	1.75 - 1.85
Resorcinol, pure	lb.	2.25 - 2.30
Salicylic acid, tech., in bbls.	lb.	.19 - .22
Salicylic acid, U. S. P.	lb.	.20 - .25
Salol	lb.	.80 - .85
Solvent naphtha, water-white, in drums, 100 gal.	gal.	.25 - .28
Solvent naphtha, crude, heavy, in drums, 100 gal.	gal.	.14 - .16
Sulphanilic acid, crude	lb.	.30 - .35
Tolidine	lb.	.25 - .35
Toluidine, mixed	lb.	.40 - .45
Toluene, in tank cars	gal.	.25 - .28
Toluene, in drums	gal.	.28 - .31
Xylidines, drums, 100 gal.	lb.	.40 - .45
Xylene, pure, in drums	gal.	.40 - .45
Xylene, pure, in tank cars	gal.	.45 - .45
Xylene, commercial, in drums, 100 gal.	gal.	.33 - .35
Xylene, commercial, in tank cars	gal.	.30 - .35

Waxes

Prices based on original packages in large quantities.

Beeswax, refined, dark	lb.	\$0.23 - \$0.25
Beeswax, refined, light	lb.	.25 - .27
Beeswax, white pure	lb.	.42 - .45
Carnauba, Florida	lb.	.58 - .60
Carnauba, No. 2, North Country	lb.	.25 - .26
Carnauba, No. 3, North Country	lb.	.16 - .17
Japan	lb.	.17 - .17
Montan, crude	lb.	.06 - .06
Paraffine waxes, crude match wax (white) 105-110 m.p.	lb.	.03 - .03
Paraffine waxes, crude, scale 124-126 m.p.	lb.	.02 - .02
Paraffine waxes, refined, 118-120 m.p.	lb.	.03 - .03
Paraffine waxes, refined, 125 m.p.	lb.	.04 - .04
Paraffine waxes, refined, 128-130 m.p.	lb.	.04 - .05
Paraffine waxes, refined, 133-135 m.p.	lb.	.05 - .05
Paraffine waxes, refined, 135-137 m.p.	lb.	.05 - .06
Stearic acid, single pressed	lb.	.09 - .09
Stearic acid, double pressed	lb.	.09 - .09
Stearic acid, triple pressed	lb.	.10 - .10

Naval Stores

All prices are f.o.b. New York unless otherwise stated, and are based on carload lots. The oils in 50-gal. bbls., gross weight, 500 lb.

Rosin B-D, bbl.	280 lb.	\$5.20 -
Rosin E-I	280 lb.	5.80 - 6.00
Rosin K-N	280 lb.	6.50 - 6.70
Rosin W. G.-W. W.	280 lb.	6.80 -
Wood rosin, bbl.	280 lb.	6.25 -
Spirits of turpentine	gal.	.62 -
Wood turpentine steam dist.	gal.	.60 -
Wood turpentine, dest. dist.	gal.	.58 -
Pine tar pitch, bbl.	200 lb.	6.75 -
Tar, kiln burned, bbl. (500 lb.)	bbl.	11.50 -
Retort tar, bbl.	500 lb.	11.50 -
Rosin oil, first run	gal.	.36 -
Rosin oil, second run	gal.	.38 -
Rosin oil, third run	gal.	.43 -
Pine oil, steam dist., sp.gr. 0.930-0.940	gal.	1.80 -
Pine oil, pure, dest. dist.	gal.	1.50 -
Pine tar oil, ref., sp.gr. 1.025-1.035	gal.	.46 -
Pine tar oil, crude, sp.gr. 1.025-1.035 tank cars f.o.b. Jacksonville, Fla.	gal.	.35 -
Pine tar oil, double ref., sp.gr. 0.965-0.990	gal.	.75 -
Pine tar, ref., thin, sp.gr. 1.080-1.960	gal.	.35 -
Turpentine, crude, sp. gr. 0.900-0.970	gal.	1.20 -
Hardwood oil, f.o.b. Mich., sp.gr. 0.960-0.990	gal.	.35 -
Pinewood creosote, ref.	gal.	.52 -

Solvents

73-76 deg., steel bbls. (85 lb.)	gal.	\$0.41 -
70-72 deg., steel bbls. (85 lb.)	gal.	.39 -
68-70 deg., steel bbls. (85 lb.)	gal.	.33 -
V. M. and P. naphtha, steel bbls. (85 lb.)	gal.	.30 -

Crude Rubber

Para-Upriver fine	lb.	\$0.16 - .17
Upriver coarse	lb.	.09 - .09
Upriver cauchoo ball	lb.	.11 - .12
Plantation—First latex crepe	lb.	.14 - .14
Ribbed smoked sheets	lb.	.12 - .12
Brown crepe, thin, clean	lb.	.15 - .15
Amber crepe No. 1	lb.	.17 - .17

Oils

VEGETABLE

The following prices are f.o.b. New York for carload lots.

Castor oil, No. 3, in bbls.	lb.	\$0.08 - \$0.09
Castor oil, AA, in bbls.	lb.	.10 - .10
China wood oil, in bbls. (f.o.b. Pac. coast)	lb.	.13 - .13
Cocoonut oil, Ceylon grade, in bbls.	lb.	.10 - .10
Cocoonut oil, Cochinchina grade, in bbls.	lb.	.11 - .11
Corn oil, crude, in bbls.	lb.	.07 - .07
Cottonseed oil, crude (f. o. b. mill)	lb.	.05 - .05
Cottonseed oil, summer yellow	lb.	.07 - .08
Cottonseed oil, winter yellow	lb.	.08 - .08
Linseed oil, raw, car lots (domestic)	gal.	.76 - .76
Linseed oil, raw, tank cars (domestic)	gal.	.70 - .70
Linseed oil, in 5-bbl lots (domestic)	gal.	.79 - .79

Olive oil, Denatured.....	gal	\$1.40	—	\$1.60
Palm, Lagos.....	lb.	.06	—	.07
Palm, Niger.....	lb.	.05 ¹ / ₂	—	.05 ¹ / ₂
Peanut oil, crude, tank cars (f.o.b. mill).....	lb.	.05 ¹ / ₂	—	.06
Peanut oil, refined, in bbls.....	lb.	.10	—	.10 ¹ / ₂
Rapeseed oil, refined in bbls.....	gal.	.88	—	.90
Rapeseed oil, blown, in bbls.....	gal.	.94	—	.95
Soya bean oil (Manchurian), in bbls. N. Y.....	lb.	.07 ³ / ₄	—	
Soya bean oil, tank cars, f.o.b., Pacific coast.....	lb.	.05 ³ / ₄	—	

FISH

Light pressed menhaden.....	gal.	\$0.40	—	\$0.41
Yellow bleached menhaden.....	gal.	.42	—	
White bleached menhaden.....	gal.	.44	—	
Blown menhaden.....	gal.	.80	—	

Miscellaneous Materials

All f.o.b. New York Unless Otherwise Stated

Barytes, ground, white, f.o.b. Kings Creek, S. C.....	net ton	\$24.00	—	30.00
Barytes, ground, off color, f.o.b. Kings Creek.....	net ton	22.00	—	26.00
Barytes, crude, 88% @ 94% ba., Kings Creek.....	net ton	10.00	—	15.00
Barytes, floated, f.o.b. St. Louis.....	net ton	26.50	—	28.00
Barytes, crude, first grade, Missouri.....	net ton	7.00	—	
Blanc fixe, dry.....	lb.	.05	—	.05 ¹ / ₂
Blanc fixe, pulp.....	net ton	50.00	—	60.00
Casein.....	lb.	.09	—	.12
Chalk, domestic, extra light.....	lb.	.05	—	.05 ¹ / ₂
Chalk, domestic, light.....	lb.	.04 ¹ / ₂	—	.05
Chalk, domestic, heavy.....	lb.	.04	—	.05
Chalk, English, extra light.....	lb.	.05	—	.07
Chalk, English, light.....	lb.	.05	—	.06
Chalk, English, dense.....	lb.	.04 ¹ / ₂	—	.05
China clay (kaolin) crude, f.o.b. mines, Georgia.....	net ton	8.00	—	10.00
China clay (kaolin) washed, f.o.b. Georgia.....	net ton	12.00	—	15.00
China clay (kaolin) powdered, f.o.b. Georgia.....	net ton	18.00	—	22.00
China clay (kaolin) crude f.o.b. Virginia points.....	net ton	8.00	—	12.00
China clay (kaolin) ground, f.o.b. Virginia points.....	net ton	15.00	—	30.00
China clay (kaolin), imported, lump.....	net ton	15.00	—	20.00
China clay (kaolin), imported, powdered.....	net ton	20.00	—	30.00
Feldspar, crude, f.o.b. Maryland and North Carolina points.....	gross ton	8.00	—	14.00
Feldspar, crude, f.o.b. Maine.....	net ton	7.50	—	10.00
Feldspar, ground, f.o.b. Maine.....	net ton	21.00	—	23.00
Feldspar, ground, f.o.b. North Carolina.....	net ton	17.00	—	21.00
Feldspar, ground, f.o.b. N. Y. State.....	net ton	17.00	—	21.00
Feldspar, ground, f.o.b. Baltimore.....	net ton	27.00	—	30.00
Fullers earth, f.o.b. Mines.....	net ton	16.00	—	17.00
Fullers earth, granular, f.o.b. Pa.....	net ton	15.00	—	18.00
Fullers earth, powdered, f.o.b. Fla.....	net ton	18.00	—	
Fullers earth, imported, powdered.....	net ton	24.00	—	27.00
Graphite, Ceylon lump, first quality.....	lb.	.07 ¹ / ₂	—	.08
Graphite, Ceylon chip.....	lb.	.06	—	.06 ¹ / ₂
Graphite, high grade amorphous crude.....	lb.	.02 ¹ / ₂	—	.03
Pumice stone, imported, lump.....	lb.	.04	—	.50
Pumice stone, domestic lump.....	lb.	.05	—	.05 ¹ / ₂
Pumice stone, ground.....	lb.	.06	—	.07
Quartz (acid tower) first to head, f.o.b. Baltimore.....	net ton		—	10.00
Quartz (acid tower) 1 ¹ / ₂ @ 2 in., f.o.b. Baltimore.....	net ton		—	14.00
Quartz (acid tower) rice, f.o.b. Baltimore.....	net ton		—	17.00
Quartz, lump, f.o.b. North Carolina.....	net ton	5.00	—	7.50
Shellac, orange fine.....	lb.	.70	—	
Shellac, orange superfine.....	lb.	.73	—	.74
Shellac, A. C. garnet.....	lb.	.54	—	.55
Shellac, T. N.....	lb.	.69	—	.70
Soapstone.....	ton	12.00	—	15.00
Sodium chloride.....	long ton	12.50	—	13.00
Talc, paper-making grades, f.o.b. Vermont.....	ton	11.00	—	20.00
Talc, roofing grades, f.o.b. Vermont.....	ton	8.50	—	13.00
Talc, rubber grades, f.o.b. Vermont.....	ton	11.00	—	18.00
Talc, powdered, Southern, f.o.b. cars.....	ton	10.00	—	14.00
Talc, imported.....	ton	35.00	—	40.00
Talc, California talcum powder grade.....	ton	18.00	—	40.00

Refractories

Bauxite brick, 56% Al, f.o.b. Pittsburgh.....	per ton	\$35.00—50.00	
Carborundum refractory brick, 9-in. { less than carlot	1,000	1250.00	
..... { carlot lots	1,000	1100.00	
Chrome brick, f.o.b. Eastern shipping points.....	net ton	75—90	
Chrome cement, 40—45% Cr ₂ O ₃	net ton	45—50	
Chrome cement, 40—45% Cr ₂ O ₃ , sacks, in car lots, f.o.b. Eastern shipping points.....	net ton		55
Fireclay brick, 1st quality, 9-in. shapes, f.o.b. Pennsylvania, Ohio and Kentucky works.....	1,000	40—50	
Fireclay brick, 2nd quality, 9-in. shapes, f.o.b. Pennsylvania, Ohio and Kentucky works.....	1,000	40—50	
Magnesite brick, 9-in. straight.....	net ton	90	
Magnesite brick, 9-in. arches, wedges and keys.....	net ton	100	
Magnesite brick, 9-in. arches, wedges and keys.....	net ton	110	
Silica brick, 9-in. sizes, f.o.b. Chicago district.....	1,000	45—55	
Silica brick, 9-in. sizes, f.o.b. Birmingham district.....	1,000	45—55	
Silica brick, 9-in. sizes, f.o.b. Mt. Union, Pa.....	1,000	45—55	

Ferro-Alloys

All f.o.b. Works

Ferro-titanium, 15-18%, f.o.b. Niagara Falls, N. Y.....	net ton	\$200.00 — \$225.00	
Ferrochrome per lb. of Cr. contained, 6-8% carbon, carlots.....	lb.	.14 —	
Ferrochrome per lb. of Cr. contained, 4-6% carbon, carlots.....	lb.	.15 —	
Ferromanganese, 76-80% Mn, domestic.....	gross ton	75.00 —	81.00
Ferromanganese, 76-80% Mn, English.....	gross ton	75.00 —	81.00
Spiegeleisen, 18-22% Mn.....	gross ton	30.00 —	32.00
Ferromolybdenum, 50-60% Mo, per lb. of Mo.....	lb.	2.50 —	
Ferrosilicon, 10-15%.....	gross ton	42.00 —	45.00
Ferrosilicon, 50%.....	gross ton	70.00 —	75.00
Ferrosilicon, 75%.....	gross ton	140.00 —	145.00
Ferrotungsten, 70-80%, per lb. of contained W.....	lb.	.45 —	.50
Ferroumium, 35-50% of U, per lb. of U content.....	lb.	6.00 —	
Ferrovanadium, 30-40% per lb. of contained V.....	lb.	5.00 —	6.50

Ores and Semi-finished Products

All f.o.b. New York, Unless Otherwise Stated

Bauxite, 52% Al content.....	gross ton	\$8.00 — \$10.00	
Chrome ore, Calif. concentrates, 50% min. Cr ₂ O ₃	unit	.40 — .45	
Chrome ore, 50% Cr ₂ O ₃ , f.o.b. Atlantic seaboard.....	unit	.40 — .45	
Coke, foundry, f.o.b. ovens.....	net ton	4.00 — 4.50	
Coke, furnace, f.o.b. ovens.....	net ton	3.00 — 3.25	
Coke, petroleum, refinery, Atlantic seaboard.....	net ton	15.00 — 16.00	
Fluorspar, lump, f.o.b. mines, New Mexico.....	net ton	12.50 —	
Fluorspar, standard, domestic washed gravel Kentucky and Illinois mines.....	net ton	18.00 — 20.00	
Ilmenite, 52% TiO ₂ , per lb. ore.....	lb.	.01 ¹ / ₂ —	.01 ¹ / ₂
Manganese ore, 50% Mn, c.i.f. Atlantic seaport.....	unit	.25 —	
Manganese ore, chemical (MnO ₂).....	gross ton	55.00 — 60.00	
Molybdenite, 85% MoS ₂ , per lb. of MoS ₂ , N. Y.....	lb.	.55 —	.60
Monazite, per unit of ThO ₂ , c.i.f., Atlantic seaport.....	unit	30.00 —	
Pyrites, Spanish, fines, c.i.f., Atlantic seaport.....	unit	.14 —	.14
Pyrites, Spanish, furnace size, c.i.f. Atlantic seaport.....	unit	.14 —	.14
Pyrites, domestic, fines, f.o.b. mines, Ga.....	unit	.12 —	.13
Rutile, 95% TiO ₂ per lb. ore.....	lb.	.15 —	
Tungsten, scheelite, 60% WO ₃ and over, per unit of WO ₃ (nominal).....	unit	2.75 — 3.00	
Tungsten, Wolframite, 60% WO ₃ and over, per unit of WO ₃ , N. Y. C.....	unit	3.00 — 3.25	
Uranium ore (carnotite) per lb. of U ₃ O ₈	lb.	1.50 — 2.50	
Uranium oxide, 96% per lb. contained U ₃ O ₈	lb.	2.25 — 2.50	
Vanadium pentoxide, 99%.....	lb.	12.00 — 14.00	
Vanadium ore, per lb. of V ₂ O ₅ contained.....	lb.	1.50 —	
Zircon, washed, iron free.....	lb.	.03 —	

Non-Ferrous Metals

New York Markets

Copper, electrolytic.....		12.85—13.00	
Aluminum, 98 to 99 per cent.....		28.00@28.5

OLD METALS—The following are the dealers' purchasing prices in cents per pound:

	New York Current	Cleveland	Chicago
Copper, heavy and crucible.....	9.25@9.50	9.25	9.50
Copper, heavy and wire.....	8.25@8.50	8.50	8.50
Copper, light and bottoms.....	7.25@7.75	7.50	7.25
Lead, heavy.....	3.25@3.50	3.25	3.25
Lead, tea.....	2.25@2.35	2.25	2.25
Brass, heavy.....	4.25@4.50	4.50	5.00
Brass, light.....	3.25@3.50	3.25	3.50
No. 1 yellow brass turnings.....	4.25@4.50	4.25	4.50
Zinc.....	2.00@2.50	2.00	2.25

Structural Material

The following base prices per 100 lb. steel or structural shapes 3 in. by 1/2 in. and larger, and plates 1/2 in. and heavier, from jobbers' warehouses in the cities named:

	New York	Cleveland	Chicago
Structural shapes.....	\$2.60	\$3.23	\$3.23
8 ft steel bars.....	2.50	3.00	3.13
Soft steel bar shapes.....	2.50	3.13	3.13
Soft steel bands.....	2.85	3.83	3.78
Plates, 1/2 to 1 in. thick.....	2.50	3.30	3.23

*Add 15c per 100 lb. for trucking to Jersey City and 10c for delivery in New York and Brooklyn

Industrial

Financial, Construction and Manufacturers' News

Construction and Operation

Alabama

MOBILE—The Mobile Paint Mfg. Co., 62 South Commerce St., recently organized with a capital of \$50,000, has acquired a 3-story building and will equip the structure for the manufacture of paints, colors, etc. It is proposed to develop an output of 2,000 gal. of material per day. W. A. Benson is manager.

BIRMINGHAM—The Atlas Machine & Foundry Co. has plans under way for the erection of a 1-story addition, 65 x 100 ft., estimated to cost about \$10,000.

Arkansas

HOT SPRINGS—The Silver King Mining Co., 306 Citizens' National Bank Bldg., is planning for the installation of a new mining plant at its silver properties at Silver, Ark., totaling in excess of 1,000 acres. The machinery is estimated to cost about \$200,000. It is planned to develop a large production. J. W. Kelly is president.

EL DORADO—The Arkansas Royalty Co., recently organized with a capital of \$100,000, has preliminary plans under way for the erection of a new oil refinery on a local site. Lee Miles is president; E. E. King is secretary and treasurer.

California

SANTA CLARA—The Homer-Knowles Pottery Co., has broken ground for the construction of its proposed new local plant, estimated to cost in excess of \$100,000 with equipment.

SAN MATEO—The proposed new plant to be erected here by the Illinois-Pacific Glass Co., Fifteenth and Folsom Sts., San Francisco, is estimated to cost close to \$1,000,000, including machinery. The city, through the Chamber of Commerce, has been asked to donate a site. The initial plant will give employment to about 600 operatives.

LOS ANGELES—The Union Oil Co. has taken bids for the erection of a new laboratory building in the Wilmington district. It will be constructed in conjunction with a new administration building, estimated to cost about \$300,000.

Colorado

DENVER—The Producers' & Refiners' Corp. has disposed of a bond issue of \$3,000,000, and a portion of the proceeds will be used for plant extensions and improvements. A new skimming plant will be constructed in the vicinity of Casper, Wyo., estimated to cost about \$400,000, including a new pipeline from the company wells in the Salt Lake field to this location. F. E. Kistler is president.

Connecticut

MERIDEN—The C. E. Schunack Co., manufacturer of paper boxes and containers, has awarded a contract to the H. Wales Lines Co., Holyoke, Mass., for the erection of a 2-story addition, 42 x 46 ft., with 1-story extension, 14 x 42 ft. Ground will be broken at once.

Florida

STUART—Walter J. Lloyd and associates are organizing a company with capital of \$300,000 for the establishment of a local tannery and fertilizer manufacturing plant, handling shark, porpoise skins, etc. A building has been acquired, heretofore used as an ice-manufacturing plant, and machinery will be installed at an early date. J. B. Sisco is in charge of plant improvements and equipment.

TAMPA—The Southern Bottle Mfg. Co., 402 Curry Bldg., recently organized with a capital of \$150,000, has awarded a contract to Oatley & Jones, Tampa, for the erection of a new local plant for the manufacture of glass bottles, jars, etc. It will be 1-story, 60 x 150 ft., with wing extension, 40 x 102 ft. The machinery installation will cost about \$25,000, including

a 6 to 8 ring furnace. J. F. Jones is president; and R. L. Rundell, secretary and treasurer.

Kentucky

ASHLAND—The East Kentucky Oil Association is considering the erection of a new oil refinery on a local site.

Louisiana

NEW IBERIA—The Charles Boldt Paper Mills Co., Cincinnati, O., is completing the erection of its new local mill, representing an investment of close to \$1,000,000, and will soon begin production for the manufacture of paper board products.

Maryland

FREDERICK—The O. J. Keller Lime Co. has awarded a contract to the McClintic-Marshall Co., Pittsburgh, Pa., for the construction of its proposed new lime manufacturing plant. Richard K. Meade, 13 East Fayette St., Baltimore, is engineer.

BALTIMORE—The American Sugar Refining Co., 117 Wall St., New York, N. Y., has filed plans for the erection of a new brick and steel filter plant at Woodall and Clement Sts., 80 x 203 ft., for its new local sugar refinery. Stone & Webster, Inc., 120 B'way, New York, is contractor.

BALTIMORE—The Baltimore Copper-smith Co., 1914 Aliceanna St., manufacturer of copper and brass specialties, is planning for enlargements in its plant. Gustav Larsen is president.

Massachusetts

HOLYOKE—The Whiting Paper Co. has awarded a contract to the Casper Ranger Construction Co. for the erection of an addition to the machine department at its No. 2 Mill, to cost about \$14,000.

CAMBRIDGE—The George Lawrence Co., Lansdowne and Green Sts., has filed plans for the erection of a new 1-story, brick and concrete plant for the manufacture of steel springs for automobile service, estimated to cost about \$30,000. George M. Davis & Sons, Cambridge, have the building contract.

INDIAN ORCHARD—The Chapman Valve Mfg. Co., Pine St., manufacturer of heavy-duty gate and other type valves, has broken ground for the construction of its new 1-story foundry, 50 x 275 ft., with two wings, each 20 x 28 ft., to be equipped for the production of iron castings.

WESTFIELD—The Strathmore Paper Co., Mittineague, Mass., is reported to be negotiating for the purchase of the paper mill of the Crane Paper Co., Westfield, with consideration involving about \$500,000. Upon acquisition the mill will be used by the new owner as a branch plant.

Michigan

DETROIT—The Fraser Paint & Varnish Co. is said to be planning for the rebuilding of its plant destroyed by fire May 24, with loss estimated at about \$100,000, including equipment.

Missouri

KNOB NOSTER—The Johnson County Brick Co., recently organized with a capital of \$125,000, has commenced the rebuilding of its local brick manufacturing plant. New kilns, both of up-draft and down-draft type, will be constructed with aggregate capacity of about 500,000 bricks. The daily output at the plant will average 40,000 finished bricks. At a later date machinery will be installed for the manufacture of hollow tile products. S. C. Garrett, Warrensburg, Mo., is secretary and manager.

New Jersey

NEWARK—The United Butchers' Fat Rendering Co., Jersey City, N. J., recently organized with a capital of \$150,000, has acquired property on Doremus Ave., Newark, adjoining the chemical works of the Butterworth-Judson Corp., and heretofore held by that company. The site will be used for the erection of a new plant for the manufacture of fertilizer, tallow, glue and kindred products, utilizing the fat, hides, etc., of cattle. Plans for the new plant will be placed under way at an early

date, and machinery acquired. Robert H. Bayerl, 302 Jackson Ave., Jersey City, is president.

NEWARK—E. I. du Pont de Nemours & Co. have filed plans for the erection of additions to their chemical works on Vanderpool St. to cost about \$29,000, including alterations and improvements in laboratory and other buildings.

New York

NEW YORK—The Sinclair & Valentine Co., 611 West 129th St., manufacturer of lithographing inks, etc., has awarded a contract to the Vought Construction Co., 133 East 44th St., for the erection of a new 3-story plant addition, 73x125 ft., on 129th St. near B'way.

BUFFALO—The Niagara Gas Corp., recently organized to take over the artificial gas works of William J. Judge, has made application to the Public Service Commission for permission to build a new gas plant to be used for service at Buffalo and at Cheektowaga.

GLENS FALLS—The International Paper Co., 38 Broad St., New York City, has broken ground for the erection of its proposed new hydro-electric power plant on Sherman Island, near Glens Falls, to cost in excess of \$1,500,000. It will be used for paper mill service in this section.

Ohio

CLEVELAND—The Sterling Brass Co., 4610 St. Clair Ave., has completed plans and will take bids at once for the erection of a new 2-story brass foundry and machine shop, 145x200 ft., at St. Catherine and 93d Sts., to cost about \$100,000 with equipment. Allen Sogg, Hippodrome Bldg., is architect and engineer. S. L. Will is head.

CANTON—The Canton Brick & Fireproofing Co., recently organized with a capital of \$1,500,000 to take over a number of brick and kindred plants, will soon break ground for the erection of a new brick and tile plant at Midvale, O. A branch line has been constructed from the Baltimore & Ohio R.R. to the site. Dr. W. A. Demuth, New Philadelphia, O., is president.

Pennsylvania

PHILADELPHIA—The Philadelphia Paper Mfg. Co., River Road, Manayunk, has filed plans for the erection of a new 2-story, reinforced-concrete building at its plant, 100x180 ft., to cost about \$200,000.

PALMERTON—The New Jersey Zinc Co. is increasing production at its local works and has reinstated about 100 operatives after a number of weeks of idleness. A reduced wage scale has been placed into effect.

JEANNETTE—George R. West, recently resigned as president of the Westmoreland Specialty Co., Grapeville, Pa., has organized a new company to be known as George R. West & Sons, to operate a local glass-manufacturing plant. An existing building has been secured and machinery will be installed for the production of fine glassware products. Charles H. and George L. West are also members of the new organization.

ALLENTOWN—The Allentown Copperas Co., a subsidiary of C. K. Williams & Co., Easton, Pa., manufacturer of mineral colors, paints, etc., is planning for the rebuilding of the portion of its plant destroyed by fire June 9, with loss estimated at about \$35,000. Robert Miller is local manager.

Tennessee

KNOXVILLE—The Knoxville Fertilizer Co., recently organized, is planning for the establishment of a new local plant for the manufacture of acid phosphate and kindred products. The initial plant is estimated to cost about \$150,000. Hanson L. Dulin is president and James W. Dean secretary and treasurer.

NASHVILLE—The Victoria Oil & Refining Co. is said to be planning for the immediate rebuilding of its distilling plant recently damaged by fire, with loss of about \$25,000.

Texas

SWEETWATER—The United States Gypsum Co., 205 West Monroe St., Chicago, Ill., is perfecting plans for the erection of its proposed new plant at Sweetwater, estimated to cost close to \$1,000,000 with machinery.

Virginia

NORFOLK—The F. S. Royster Guano Co. has arranged for a bond issue of \$2,500,000, the proceeds to be used for operations, proposed extensions, financing, etc. The company specializes in the manufacture of chemical fertilizers and affiliated products. F. S. Royster is president.

BRISTOL—The Iron City Stove & Foundry Co., recently reorganized with a capital of \$10,000, is planning for extensions in its foundry and other plant departments to include the installation of new machinery. E. H. Wilkinson is president.

West Virginia

CLARKSBURG—The Eagle Convex Glass Specialty Co., Box 525, recently organized with a capital of \$50,000, has acquired a local building and will install machinery for the manufacture of convex glass products, including clock faces, portrait glass, etc.; considerable beveling equipment will be installed. F. Aucremanne is president and manager.

New Companies

THE AMERICAN METALLURGICAL CORPORATION, of Boston, Mass., has been incorporated with a capital stock of \$50,000, to engage in the metallurgical business. Officers are: Harry O. Breaker, of Winthrop Center, Mass., president; Kristian A. Juthe, of Newton Center, Mass., treasurer; and John R. Hanmer, 201 Devonshire St., Boston.

THE VAYCIDE CHEMICAL CORP., Birmingham, Ala., has been incorporated with a capital of \$60,000 to manufacture chemicals and chemical byproducts. George B. McVay, Jr., Birmingham, is president and treasurer; M. D. McVay is secretary.

THE CONSOLIDATED SILVER MOUNTAIN MINES CO., Spokane, Wash., has been incorporated with a capital of \$150,000 to operate silver mines and refining works. The incorporators are W. E. Seelye, Charles Tanner and H. A. Manchester. The company is represented by McCarthy, Edge & Lantz, Paulsen Bldg., Spokane.

THE LOS ANGELES-BROWNWOOD OIL CO., Los Angeles, Cal., has been incorporated with a capital of \$250,000 to manufacture petroleum products. The incorporators are C. C. Loomis, F. R. Miner and S. S. McKinney. Lloyd Wright, 208 Currier Bldg., represents the company.

THE CORTLAND GRINDING WHEELS CORP., Chester, Mass., has been incorporated with a capital of 8,000 shares of stock, no par value, to manufacture abrasive materials. Charles J. Ayer, Plymouth, Mass., is treasurer; Ralph S. Spooner and E. Bertram Pike, Chester, are directors.

THE STETSON CHINA CO., Room 1535, 1537 South State St., Chicago, Ill., has been incorporated with a capital of \$100,000 to manufacture crockery and earthenware. The incorporators are Lewis B. and Joseph Stetson.

THE D. L. & D. CORRUGATED PAPER PRODUCTS CO., New York City, has been incorporated with a capital of \$75,000 to manufacture corrugated paper specialties. The incorporators are J. and A. Wolf, and M. R. Schner, 7 Dey St.

THE IMPERIAL LEATHER CO., INC., Lynn, Mass., has been incorporated with a capital of \$10,000 to manufacture leather products. F. A. Fleith is president, and Augustus S. Crovo, 93 Crest Ave., Beachmont, treasurer.

THE GREEN BAY TURPENTINE CO., Bushnell, Fla., has been incorporated with a capital of \$16,000 to manufacture turpentine and affiliated products. J. F. Lambert is president, and J. H. McKnight, Bushnell, secretary and treasurer.

THE DRAYTON TUNNEL KILN CO., Brazil, Ind., has been incorporated under Delaware laws with capital of \$300,000 to manufacture tunnel kilns for ceramic and other kindred service. The incorporators are William Drayton, Walter J. Kissler, Brazil; and E. Edward Dean, Indianapolis, Ind.

THE U-RUB-IT CHEMICAL CO., Philadelphia, Pa., has been incorporated with a capital of \$100,000 to manufacture chemicals and chemical byproducts. The incorporators are William T. Conwell, W. L. Henderson and William F. Vogel, Philadelphia. Thomas Conwell, Lewes, Del., represents the company.

THE GRAND CHEMICAL PRODUCTS CO., Grandville and Grand Rapids, Mich., has been incorporated with a capital of \$30,000 to manufacture chemicals and chemical byproducts. The incorporators are R. A. Caldwell, Grandville; Claude M. Connor and Stanley L. Barnett, Grand Rapids.

THE SUBURBAN OIL CO., Pasadena, Cal., has been incorporated with a capital of \$75,000 to manufacture petroleum products. The incorporators are J. C. Cook, William W. and K. D. Butterfield. The company is represented by Ticknor, Carter & Webster, Pasadena.

THE HERCULES EXPLOSIVES CORP., New York City, has been incorporated with a capital of \$4,000,000 to manufacture powder, dynamite, explosives, etc. The in-

corporators are R. H. Dunham, T. W. Bacchus and W. M. Annette. The company is represented by White & Case, 14 Wall St.

THE RICH SQUARE BRICK CO., Rich Square, Tex., has been incorporated with a capital of \$400,000 to manufacture bricks and other burned clay products. J. R. Connell, Rich Square, is president.

THE KANGAROO POLISH CO., Newton, Mass., has been incorporated with a capital of \$50,000 to manufacture polishes and kindred specialties. Robert G. Shaw 2nd, Newton Square, Mass., is president and treasurer; Albert N. Lyon and Warwick Henderson are directors.

THE MURDO OIL CO., Park and Division Sts., DuQuoin, Ill., has been incorporated with a capital of \$50,000 to manufacture refined oil products. David B. Levy, Murphysboro, Ill., is the principal incorporator.

THE GUARANTEE PRESTO-WATER CHEMICAL CO., Nashville, Tenn., has been incorporated with a capital of \$50,000 to manufacture chemicals and chemical byproducts. The incorporators are John H. Grant and Walter H. Moppin, Nashville.

THE VARSITY GLASS PRODUCTS CO., Pasaic, N. J., has been incorporated with a capital of \$35,000 to manufacture glass specialties. The incorporators are Henry J. Fixsen, Henry S. Hubschmitt and Frank M. Griswold. James H. Penn, 816 Main Ave., represents the company.

THE HUNTINGTON SUPERIOR OIL CO., Los Angeles, Cal., has been incorporated with a capital of \$200,000, to manufacture petroleum products. The incorporators are W. J. Little, Allen Janes and A. P. G. Steffes. The company is represented by Randall, Bartlett & White, 605 California Bldg., Los Angeles.

THE STANDARD FERTILIZER CO., Centerville, Tenn., has been incorporated with a capital of \$480,000 to manufacture fertilizer products. A. H. Grigsby is president, H. H. Campbell vice-president and C. A. Betts secretary and treasurer, all of Centerville.

THE RECTOR OIL & REFINING CO., Rector, Ark., has been incorporated with a capital of \$75,000, to manufacture refined oil products. The incorporators are C. W. Weideman and W. H. Simmons, Rector.

THE CONSOLIDATED LEATHER CO., 468 Frelinghuysen Ave., Newark, N. J., has filed notice of organization to manufacture leather products. The company is headed by Philip Frank, 270 West End Ave., and Henry Frank, 970 Park Ave., both of New York City.

THE NEW JERSEY CRAYON CO., INC., Paterson, N. J., has been incorporated with a capital of \$10,000 to manufacture wax crayons, chalk, etc. The incorporators are Arthur V. V. Livingston and J. M. Camagni, 21 Bridge St., Paterson.

THE MARDEN-WILD CORP., Boston, Mass., has been incorporated with a capital of \$50,000 to manufacture oils, dyestuffs and kindred products. Frank W. Marden is president, and Prescott F. Wild, Winchester, Mass., treasurer.

THE GENERAL REFRACTORIES CO., Philadelphia, Pa., has been incorporated with a nominal capital of \$5,000 to manufacture firebrick, furnace linings and other refractory products. The incorporators are John R. Sproul, Chester, Pa., son of Gov. Sproul; Burrows Sloan, Ardmore, Pa.; and James H. France, Philadelphia.

THE NEW ENGLAND-TEXAS OIL & REFINING SYNDICATE, INC., Springfield, Mass., has been incorporated with a capital of \$1,000,000 to manufacture refined oil products. Charles N. Hawkes is president; and Frederick L. Haskins, Springfield, treasurer.

THE WESTERN PIPE & STEEL CO. OF ILLINOIS, INC., Room 7, 154 West Randolph St., Chicago, Ill., has been incorporated with a capital of \$100,000 to manufacture steel products. The incorporators are Frederick T. Hoyt, John R. Lenfesty and Reuben W. Newton.

THE TAFT CENTRAL OIL CO., Los Angeles, Cal., has been incorporated with a capital of \$250,000 to manufacture petroleum products. The incorporators are E. L. Mason, A. Richardson, Los Angeles; and C. C. Montgomery, 811 Washington Bldg., Pasadena, Cal.

GEORGE MANN & CO., INC., Providence, R. I., has been incorporated with a capital of 250 shares of stock, no par value, to manufacture chemicals and chemical byproducts. The incorporators are George Mann and George F. Waters, Fall River, Mass.; and Edward G. Fletcher, Providence.

THE NEWPORT MFG. CO., 2555 North Crawford Ave., Chicago, Ill., has been incorporated with a capital of \$5,100 to manufacture chemical specialties. The incorporators are Aaron T. Rubin and Edward M. Seymour.

THE AMERICAN KAOLIN CO., Vincennes, Ind., has been incorporated with a capital of \$250,000 to operate clay and kaolin properties. The incorporators are P. L. Donie, J. A. Kapps and W. T. Bessonette, Vincennes.

THE NICHOLSON SUPPLY CORP., Fredericksburg, Va., has been incorporated with a capital of \$30,000 to manufacture mineral and vegetable oil products. The incorporators are C. O'Connor Goolrick, Fredericksburg; and George B. and Arthur D. Nicholson, Pittsburgh, Pa.

THE BRINTEX CHEMICAL CORP., New York City, has been incorporated with a capital of \$10,000 to manufacture chemicals and chemical byproducts. The incorporators are J. L. Diamond, J. L. Carty and P. J. McMahon, 87 Nassau St.

THE ROCKVILLE IRON FOUNDRY CO., Rockville, Conn., has been incorporated with a capital of \$50,000 to manufacture iron and steel, brass and bronze castings. The incorporators are S. and H. C. Murlless, Rockville; and A. L. McCarthy, Hartford, Conn.

Capital Increases, Etc.

THE GEORGIA SOAP CO., Jackson, Ga., has filed notice of increase in capital from \$500,000 to \$1,000,000.

THE CENTRAL GLASS CO., Louisville, Ky., has filed notice of increase in capital from \$1,000,000 to \$1,250,000.

THE AMERICAN LACQUER CO., Stratford, Conn., has filed notice of increase in capital from \$20,000 to \$100,000.

THE HOLMAN SOAP CO., 3104 Fox St., Chicago, Ill., has filed notice of increase in capital from \$150,000 to \$300,000.

THE DATNER OIL & REFINING CO., Detroit, Mich., has filed notice of change of name to the Detroit Oil & Refining Co.

THE DU PONT AMERICAN INDUSTRIES, INC., Wilmington, Del., manufacturer of chemicals, dyes, composition products, compounds, etc., has filed notice of increase in capital from \$50,000,000 to \$75,000,000.

THE BRADLEY-WISE PAINT CO., 650 Santa Fe Ave., Los Angeles, Cal., has filed notice of increase in capital from \$50,000 to \$150,000. H. C. Bradley is secretary.

THE AMERICAN COATING MILLS, INC., Elkhart, Ind., manufacturer of coated paper products, has filed notice of increase in capital from \$1,200,000 to \$1,400,000.

THE STANDARD OIL CO. OF INDIANA, Indianapolis, has increased its capital from \$100,000,000 to \$140,000,000.

Coming Meetings and Events

AMERICAN CERAMIC SOCIETY'S summer meeting will be held at Canton, Alliance, Sebring and East Liverpool, Ohio, July 25 to 27. Headquarters will be at the Hotel Courtland, Canton, Ohio.

AMERICAN CHEMICAL SOCIETY, THE SOCIETY OF CHEMICAL INDUSTRY and the American Section of the latter society will hold a joint meeting in New York, Sept. 6 to 10.

AMERICAN ELECTROCHEMICAL SOCIETY will hold its fall meeting in Lake Placid, N. Y., Sept. 29 and 30, and Oct. 1.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS is holding its spring meeting June 20 to 24 at Detroit. Industrial excursions will be made to Ann Arbor, Saginaw, Midland and Bay City.

AMERICAN MINING CONGRESS AND NATIONAL EXPOSITION OF MINES AND MINING EQUIPMENT will hold its twenty-fourth annual convention in the Coliseum, Chicago, Oct. 17 to 22.

AMERICAN SOCIETY FOR STEEL TREATING will hold its third annual convention and exhibition Sept. 19 to 24 at Indianapolis.

THE NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (SEVENTH) will be held during the week of Sept. 12 in the Eighth Coast Artillery Armory, New York City.

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stettens Restaurant, 842 Broad St., Newark, N. J., the second Monday of every month.

SOCIETY OF CHEMICAL INDUSTRY (BRITISH) at the invitation of the Montreal section will hold its annual meeting in Montreal and other Canadian cities during the week of Aug. 29, 1921. Details will be printed in this magazine from time to time.

Investment Of Work

CONSERVATIVE financial men recognize that these days are opportune for the investment of money in securities or materials, and particularly so in certain classes of industries which are thought to be liquidated. In other words, the person or firm having had foresight enough to conserve surplus cash may now take it into the markets and receive in exchange the commodities needed for the future in greater ratio of commodity to dollar than can possibly exist in times of business prosperity. This investor believes from past experience that depressions and periods of industrial affluence come in cycles and that it is sound thinking to expect good times in the next swing.

No brief is here supported for those salesmen, writers and other amateur optimists who distill elusive, vaporous expressions to create a general opinion that business is good and the depression is over when such obviously is not the case. The true business optimist accepts conditions as they are today and proceeds to invest with a firm faith in the future revival of economic activity and consequent increase in the value of materials purchased for cash or effort during the restricted period. Certainly no one can think that we are entirely gone to the dogs and that happy days will never come again.

These are elementary facts well known to financiers, but too seldom considered by the salaried individual in connection with the investment of his personal effort. Working for a salary is plainly conducting a business of producing a certain economic good which is marketed with the employer. The market varies with business cycles the same as for other commodities. In financial crises, with the buying power of the medium of exchange—dollar, piaster, tical or what not—increasing coincidently with the decrease in the value of goods while the salary remains fixed, the employee is getting a larger return for his efforts. A great majority of technical men enjoy this position now, notwithstanding individual observations to the contrary. It is, then, the day of the salaried man.

If the technical worker is content to accept this good fortune and continue delivering the same amount of work for the increased pay, well and good. He remains with the majority a fair, average individual. He is acceptable as an employee, but scarcely sought after. For as the value of the dollar increases, so personal effort is at a premium. It is difficult even now to find excellent men available for employment. They are too badly needed and too well appreciated in present affiliations to be released. A price must be paid to secure them. They are in demand because they have invested work.

Increased work, work as a vocation and as an avocation, merits and receives just recompense, and in this

world at that. The chap who is a work eater stands forth well toward the spotlight in periods when most men hold a dormant, almost paralyzed attitude toward commercial activity. The market is right for the investment of effort and the wise ones will develop every dyne, not merely to hold the job but rather for the accretion of personal wealth in the final accounting.

Responsibility Holds the Better Man

NOT long ago the president of a concern employing engineers and highly trained salesmen, with main offices in the East, was asked by a friend for the name of his district office manager, and was surprised to learn that there was no manager of the Western territory. Each man in that office reported directly to his particular department head at the home office. The nature of the work was such that there was little in common among the different departments. The men in the district office were of the type that could be relied upon to work with one another on those matters that might call for co-operation among departments. A chief clerk acted in details of stenographic help, supplies, etc., but without authority over the various units. The plan continues to operate successfully.

Examination of the district offices of many highly organized industrial companies reveals the fact that the individual efficiency of the better grade employee is markedly lower than might be supposed. When men worthy of responsibility are made to feel the yoke of servitude, they become reconciled to drawing the pay check and taking it easy. Servants in the Orient can prepare a meal, it is true; but one must draw the water, another carry the wood, another watch the fire, etc. The average efficiency of the total is about 10 per cent.

The other method of organizing intelligent men places the full responsibility for a field upon one man. He is checked by results alone. If he does not come up to the scratch, another replaces him. Very soon the right one is found, and this fellow sticks. He enjoys the weight of the work, the freedom of action unharassed by petty rules, lives his job all the working hours of every day and dreams of it at night.

Admittedly army organization and discipline is fine—for the military establishment where accountability for execution of definite orders accomplishes the result. Technical men are thinkers, and can see that the policy of the concern which hampers freedom of thought and action by such organization is wrong, and if they work for such a company they wilt under the management. They will come to work only for the daily bread.

The president above mentioned has developed a wonderful industrial concern thus based on the highest American business ideals. He employs the best men in his line. He knows that responsibility holds the better man.

Courage a Byproduct Of Research

MANY times these columns have called attention to the manifold advantages to industry of a well-planned and well-executed research program. It requires a serious business depression to show plainly that a business, a corporation or an organized industry which has seriously investigated its technical problems in a scientific manner is also unafraid of the future. That is a point which engineers and executives will do well to mark. Of course it takes a certain amount of commercial foresight, mental courage and common sense to build up an adequate research department and maintain it despite market fluctuations and objections of myopic penny-hounds always present somewhere in the directorate. Such admirable qualities will undoubtedly be a sound foundation for sanity during perilous times, but more than that, the organization will be stout hearted because it *knows*; others can only fear. It knows what its product is, what it will do, where it is best adapted for use, how to make an excellent and uniform product—undoubtedly such a company is getting a lion's share of the orders, and is setting the house in order for a future demand which is just around the corner.

Perhaps these thoughts would find readier acceptance by giving a concrete instance. This can the more readily be done, since it will supply the motive for a brief reminder of the work of the American Malleable Castings Association. In the words of their genial consultant, Prof. TOUCEDA, it happened that when business slackened various members realized that the time was opportune to take up matters that were pending, but which owing to pressure of work they had been unable to take up sooner. It really seems that all got the same idea at the same time, both in connection with research work they desired done and alterations needed at their plants. So despite the fact that the steel industry is operating at 20 per cent capacity, automobile construction is at a low ebb, practically no railway rolling stock is being built and the farmer is too poor to buy harvesters, the malleable iron men who *know* are going ahead with needed improvements and fundamental research.

What would have happened ten years ago? Competition was then of the cut-throat variety, the lowest bidder often executing work for much less than his total cost, had he only known it. The result, most easily seen and most impressive to the owners, was a dwindling surplus, despite a continuously debased plant; the growing use of only the rawest of immigrants and the shipment of any junk which possibly might be accepted on the contract.

Under these circumstances some of the most capable men in the industry came together from time to time for interchange of ideas, and their first move was the employment of an expert to devise a uniform accounting system. This enabled those plants, at least, to avoid ruinous quotations. But deeper down, it was discovered that the reckless disregard of quality had convinced the ordinary consumer that malleable iron was not only lacking in dependability, but the best of it was of very low strength. Everyone was buying steel castings or forgings—if they came out poor it was ascribed to ignorant manufacture; malleable was condemned as being constitutionally unfit.

With such an outlook, the association resolved to

engage competent technical help and give him all available resources to find out what was the matter with American malleable and to show how the defects could be cured. Barring a few notable exceptions, such foundry investigations were unknown; rule of thumb was plenty good enough. Yet to the credit of the association it should be said that it has consistently backed Prof. TOUCEDA in his recommendations, irrespective of cost, and has made no statement of progress unless it had been shown to be backed by incontestable data.

A full statement of the various steps taken during the past eight years which have resulted in a veritable industrial renaissance would deserve many pages, and has been presented to the technical world elsewhere. It may be summarized by saying that whereas the best of the malleable iron then made had a strength of 40,000 lb. per sq.in. with 5 per cent elongation, the average of all test-bars from the association for the year 1920 broke at 52,000 lb. per sq.in. with 13.3 per cent elongation.

This is one way of appraising the advantage of their research to the quality of their product. In the first paragraph it was attempted to show the effect on the stamina of the industry as a whole. Evidently, some kind of organized research gets results, and pays!

Petrified

Wool Fat

THE plea for greater scholarship in chemistry on the one hand and the demand for a more widespread sensing of chemistry on the other have sometimes borne curious fruits. In order to discover the frequent errors in scientific statements made by newspapers we have occasionally intimated that it would be a good thing if the editors of our dailies were to establish communication with someone who could pilot them over the charted seas of science when they want to enlighten their readers. A correspondent from the Massachusetts Institute of Technology sends us a clipping from the *Boston Traveler* of March 10 which indicates that that paper aspires to follow the advice, and yet we fear that, to put it in Irish, their chemist is the kind of a chemist that a chemist isn't. The quotation reads:

"Question: What kind of oil or fat is lanolin?"

"Answer: Lanolin is wool fat or wool grease in a petrified condition."

Prof. CIAMICIAN has referred to coal as the fossil energy of the sun, and we might even indicate lanolin as the hydrogenated juices of the sheep—although this would not be an enlightening or happy description. But the statement that it is "petrified" discourages us in our search for scientific scholarship in the revelation of the *Traveler's* chemist.

In answer to the call for broad, general training for chemists we learned lately of a requirement of a great institution bearing a Frinch name that demands proficiency in the history of Ireland as a requirement for the degree of Chemical Engineer. We might get the idea if the aspirants for the degree were prospective pharmacists hoping to learn how to cure snake-bites, for ST. PATRICK was truly a great pioneer in the prophylaxis of this most distressful evil. Then there was ROBERT BOYLE, who made chemistry the profession of a gentleman, and he was a son of the Earl of Cork. But he lived and wrought in England, while science never has seemed to find much of a welcome in Ireland. Perhaps—and we consider this idea to be no less than an inspiration!—the purpose of the course in Irish

history is to prepare young chemical engineers to succeed in politics. We need more scientific vision in politics, and the Irish seem to have a peculiar gift in the direction of getting into office. It is not altogether clear to us how the study of Irish history develops the art, but if it does, then let all the lads who would be chemical engineers be after studying the history of Ireland so as to make them Congressmen and Sinators.

The Lime Industry Looks to Research

RESEARCH was the keynote of the lime industry's nineteenth annual convention, the third since the organization of the present National Lime Association. Almost without exception the speakers pointed out the value of research in all phases of the association's activities—the determination of fundamental data, improvements in limekiln construction and in the technology of lime burning, the development of new markets and the extension of old ones through the application of data obtained from conscientious scientific studies.

Much of the time-consuming organization work has been completed and the association, representing 124 lime producers, is now able to carry out a definite program of research and educational work through the central office staff and the three technical departments—chemistry, construction and agriculture. The following extract from President CHARLES WARNER'S report is an excellent example of the manner in which the problems are being attacked:

Take, for instance, the problem of developing the best type of quick-hardening lime plaster and mortar. This question is of great importance to the construction field. It has been attempted more or less superficially and spasmodically by many manufacturers as well as in some of the past efforts of your association staff.

Under past efforts the problem has not been suitably solved for the broad welfare of the industry. It has not been until within the fiscal year just closing that we have been able to lay a broad plan for its study, utilizing fellowships at the Bureau of Standards and elsewhere for taking hold of particular phases of the problem with the intention of gradually bringing all these lines together into a broad basic report that will throw the fullest light on the proposition.

To get at this problem there are four major lines of study and research that have to be undertaken, and each of these four major divisions fans out into numerous sub-studies and minor researches:

First—The effect of burning, grinding and hydration in various combinations and in conjunction with other ingredients to locate any refinement in manufacturing processes that may stimulate hardening in the finished product.

Second—The study of any hardening materials which of and by themselves and upon addition to lime will harden the mixed product.

Third—Since carbon dioxide is the ingredient first naturally employed in the normal hardening of plasters and mortars, but, limited by the slow effect and small quantity of this gas found in normal atmosphere, it becomes necessary to determine all materials, such as charcoal, which might absorb carbonic gas in quantity yet hold it so loosely that upon admixture with lime and water a quick release of the carbonic gas would produce rapid carbonization and hardening throughout the mass.

Fourth—It is within the bounds of possibility that we can locate a chemical compound which upon addition in small quantities to lime will immediately establish in the lime an entirely new hardening characteristic and solve our problem in that fashion.

With such a forward-looking spirit of co-operation, we can confidently expect some remarkable developments in the lime industry. The industry and its leaders are to be congratulated.

Steel Production In 1920

WITH the production of steel ingots now running at the rate of about 12,000,000 gross tons a year, and prospects that the rate will drop below 10,000,000 tons in July, the official statistics of production in 1920 appear, showing that in that year 40,881,392 tons of ingots was produced. Even that was not a record production, however, for the honor belongs to 1917, with 43,619,200 tons. The 1917 production did not represent the capacity existing in the year, for while there was a surplus of orders there were physical difficulties in the way of full operation. Capacity has since increased, moreover, so that the 1920 production was decidedly short of the capacity, being hardly as much as 80 per cent. It was a year of difficulties. At the opening, when the iron and steel strike, inaugurated Sept. 22, 1919, was just over, there was some labor shortage and a great deal of labor inefficiency, while there was some shortage of coal and coke, following the outlaw strike in the coal industry. On April 1, when the steel industry had largely recovered from these troubles, the outlaw railroad strikes began, bringing about a shortage in transportation that lasted for months, or until shortage of orders began to affect some of the mills, late in September.

The production of rolled steel in 1920 was 30,970,297 tons, in the form in which steel received its last hot rolling, the total being therefore made up of rods, sheets, skelp, plates, shapes, bars, etc., forging billets and semi-finished steel that was exported. Production of rolled iron was 1,377,566 tons and production of steel castings was 1,251,542 tons.

The year 1920 was fourth best in steel ingot production, but third best in rolled steel, because 1918 was a year of heavy production of shell steel ingots, liberally cropped, and rolled steel did not make its usual percentage showing in relation to ingots. While third best in rolled steel in general, the year made a new record for production of structural shapes, with 3,306,748 tons, and as there was no large tonnage used in freight-car building there was evidently heavier consumption in construction work than would be assumed by those who held that construction work was much restricted in 1920 by high costs. Production of wire nails was only 3 or 4 per cent short of production in the two better years, 1916 and 1917, while wire-rod production was off 11 per cent from the tonnage of 1916, when there was a special demand for rods in connection with defense against submarines and the making of barb wire for land defense. The wire nail production suggests that there was a very fair degree of building activity in progress during 1920.

On the whole, the distribution of steel in the various finished products was not far from normal in 1920. There was no extremely light demand and no extremely heavy demand for any particular product, except in the case of automobile sheets, and the strain there was not in sheet-rolling capacity, but in pickling capacity. It is true the production of rails was only 2,604,116 tons, or 35 per cent less than the record production of 3,977,887 tons, made in 1906, while production of rolled iron and steel as a whole was 65 per cent greater in 1920 than in 1906, but the disappearance of rails as the dominant finished steel product is now an old story. Rails were passed by both wire rods and structural shapes in 1914 and have not come back in any subsequent year.

Presentation of the Gibbs Medal to Mme. Curie

Report of the Meeting of the Chicago Section, American Chemical Society, June 14, 1921,
When the Willard Gibbs Medal Was Presented to
Mme. Marie Sklodowska Curie

THE Chicago Section of the American Chemical Society met Tuesday, June 14, 1921, to present the Willard Gibbs Medal, founded by William A. Converse, to Mme. Marie Sklodowska Curie.

Her presence in America was the best occasion for the American people in general and for the American scientists in particular to show their appreciation of the great work she has accomplished and is still doing in the chemistry of radioactivity. The presentation of one gram of radium by the President of the United States, a gift of the women of America, the honorary degrees bestowed by leading American universities, the presentation of the Gibbs Medal and the hearty welcome she met everywhere are a few of the means at our disposal to express our esteem and appreciation for the greatest of woman scientists.

Marie Sklodowska, the granddaughter of Polish peasants and daughter of a professor of physics and chemistry, was born in Warsaw in 1867. After finishing the schools in her native city she spent a few years there as a private tutor and then went to Paris, where after three years she obtained the degree of bachelor of science in mathematics and physics. She then continued to work in the laboratories of Professors Becquerel and Curie, and soon after published the results of work accomplished under the guidance and by collaboration of these great French scientists. In 1895 she married Prof. Curie, and until 1906, when Prof. Curie died, they both undertook most successful researches on radioactive elements and radioactivity which aroused the interest of all scientists.

The steps followed in the work leading to the discovery of radioactive elements and in the solution of problems on radioactivity are best outlined by Mme. Curie herself in her address accepting the medal.

Mme. Curie is still a hard worker, and only a few days before sailing for this country she presented a new memoir before the French Academy of Sciences on Gamma Rays and Emissions of Heat by Radium and Mesothorium (*Comptes rendus*, pp. 1022-1025, April 25, 1921).

It might be mentioned here that Miss Irène Curie, one of her two daughters, is also a scientist of note, having already published a series of contributions for the advancement of chemistry, the latest being her study on the atomic weight of chlorine (*Comptes rendus*, pp. 1025-1028, April 25, 1921).

Mme. Curie has been twice honored with the Nobel prize. She is professor at the Faculty of Sciences and director of the Radium Institute in Paris.

At the meeting of the Chicago Section of the American Chemical Society the American chemists, physicists, geologists, astronomers and physicians joined to present their appreciation for the medalist through their respective spokesmen, H. N. McCoy, R. A. Millikan, T. C. Chamberlain, E. B. Frost and W. A. Pusey, while Prof. W. Lee Lewis of Northwestern University acted as toastmaster.

Address by Dr. W. Lee Lewis

In 1910 one of the most modest and retiring members of an unusually modest and retiring organization—namely, the Chicago Section of the American Chemical Society—after a long and faithful service to our section, made it possible for that section to pay its glad homage to those who have wrought immortally in our science. I refer to William A. Converse.

In attaching the name of Willard Gibbs, our greatest American chemist, to this token, it was established forever on an exalted plane of worthiness.

This is the occasion of the eleventh presentation of the Willard Gibbs Medal, the second time it has been presented to a distinguished European.

The list of those who have received this medal attests how well it has served its high purpose: Svante Arrhenius, Theodore W. Richards, Leo H. Baekeland, Ira Remsen, Arthur A. Noyes, Willis R. Whitney, Edward W. Morley, William M. Burton, William A. Noyes, F. G. Cottrell and tonight Mme. Curie, the first woman recipient.

Through all times men have sought to symbolize their gratitude for Greatness, or for what Emerson says might be better called Completeness, in a spiritual manner. The victor in the Greek games was given not an object of great worth but a wreath of wild olives. The prized guerdon of those old days of chivalry and knight errantry was a ribbon or a flower. Coins and medals are struck to commemorate national victories. Similarly the swastika, the cross, the flag of a nation, the wedding ring, the loving cup, the lotus flower, the phoenix, stand for values in human life which are not intrinsic.

In that spirit we are gathered tonight.

We have asked Drs. H. N. McCoy, R. A. Millikan, T. C. Chamberlain, E. B. Frost and W. A. Pusey to address us on some of the far-reaching consequences of the discovery of radium.

Address by Dr. Herbert N. McCoy, "For Chemistry"

The advance of every science is made over stepping stones of great discoveries. Let me illustrate by brief reference to a few of the most notable examples in chemistry.

Priestley's discovery of oxygen in 1774 and Lavoisier's prompt explanation of the rôle of this element in the burning of substances led to the proof that matter is indestructible. This fact is the basis of the most fundamental law of chemistry. Lavoisier's monumental work inspired the famous French chemist Wurtz to write many years ago: "Chemistry is a French science, founded by Lavoisier of immortal memory."

The electrolytic isolation of metallic sodium by Davy in 1810 not only led at once to the separation from their compounds of half of a dozen new metals but foreshadowed the development of the whole science and art of electrometallurgy.

In 1828, Wöhler's preparation of urea from ammo-

PHOTOGRAPHS OF MME. CURIE AND HER DAUGHTER, POSED ESPECIALLY FOR "CHEMICAL & METALLURGICAL ENGINEERING," IN MME. CURIE'S LABORATORY

niun cyanate disproved the hitherto universal view—a view strongly supported by religious dogma, be it remembered—that compounds of carbon obtained from animal and vegetable sources could be produced only through the agency of vital forces. The almost unlimited possibilities indicated by Wöhler's discovery have been amply realized. Today the number of known synthetic organic substances is over 100,000. Perkin's preparation of the first coal-tar dye, mauve, was of course a consequence of Wöhler's work. The thousand or more artificial dyes of today represent only the elaboration of Perkin's discovery.

The periodic system of Mendeléeff and of Meyer gave a system of classification of inestimable value and also furnished the first clear proof that the elements are closely interrelated.

The application of thermodynamics to chemistry in the early '70s by Willard Gibbs gave us the phase rule and served as the most important single contribution to the foundation of the science of physical chemistry. Gibbs' papers are a source of inspiration and information not yet exhausted, nearly five decades after they were written. The medal to be awarded tonight is a memorial to this illustrious chemist.

Van't Hoff's theory of solution, published in 1887, and its corollary, the ionic hypothesis, simultaneously announced by Arrhenius, served for three decades as the foremost stimulating idea for chemical and biological research.

The discovery of radium twenty-three years ago is in every way worthy to be classed among the typical great discoveries just mentioned, and we are assembled tonight to do honor to the discoverer.

IMPORTANCE OF THE DISCOVERY OF RADIUM

It is by the developments that arise from a discovery that its true importance is to be judged. If these are epoch-making and if the discovery has been the result of acute scientific insight, prophetic imagination and patient and skillful experimentation, then we are bound to acclaim the greatness of the discovery. Judged by all these facts, the discovery of radium measures up to the high place it has been accorded.

The early history of our science very plainly shows that the rapid growth of chemical knowledge was in no small measure due to the innumerable attempts of alchemists to transmute the baser metals into gold.

While two and one-half decades ago it was rank chemical heresy to admit the possibility of the transmutation of the elements, yet more than one chemist of repute had a feeling that the last word on this topic had by no means been spoken.

The advent of radium threw a clear new light on this most fascinating subject and led to revelations of a wholly unexpected nature. It seems appropriate, therefore, on this occasion briefly to review the current conception of the nature of matter and to point out the advances that have been made toward the solution of

the chemists' and physicists' most difficult problem—the transmutation of elements.

The discovery of radium revealed to science a well nigh unbelievable group of phenomena. We read in our journals that radium emits light and heat, that its rays penetrate light-proof paper and produce photographs like those of X-rays, that in the presence of radium air is ionized—that is, it is made a conductor of electricity. Then came the astounding statement that atoms of radium explode and that material fragments are shot out with velocities fifty thousand times that of a rifle ball; that these fragments are positively electrified atoms of the element helium; that particles of negative electricity (electrons) fly off with velocities that would enable them to travel around the earth between two ticks of a watch; that radium produces a sort of transcendent X-ray that can penetrate the armor plate of a battleship. Add to all this the fact, soon established beyond controversy, that radium produces continuously a radioactive gas, the emanation, unquestionably a new element, and it must be admitted that the like of such news never had been heard before.

Taken at their face value, all the above assertions about radium meant, first, that one element changed into other and different elements, and second, that energy in the form of heat and light were created from no known source. Here was indeed a most amazing difficulty, for the first of these tenets violated one of the basic laws of chemistry—the impossibility of transmutation—while the second was equally careless of the most fundamental principle of physics—the impossibility of creating energy.

We now know that the physicists were right. Energy is not created by radium. It already exists as the internal energy of the atom itself and is only liberated in radioactive change. The chemists, on the other hand, were wrong, since it was soon proved beyond a shadow of doubt that helium and emanation—both elements—are formed from the element radium. Chemists were then forced to admit that radioactive changes accomplish transmutation of the elements.

STRUCTURE OF THE RADIUM ATOM

Of what, then, is an atom composed, and what is its structure? Plainly, an atom is not a tiny, hard, structureless and indivisible bit of material, differing in nature from one element to another. Small as it is, the atom is highly complex. In structure it may be likened to our solar system on a miniature scale. After all, why not? Great and small are but relative terms. What is our earth compared with the sun, nearly a million times bigger and 93 million miles away? And what in turn is our great sun but one faint star of the myriads that fill the universe? Let your imagination have full sway and see an atom of radium as it might appear if magnified to a diameter of a hundred yards.

In the center, a nucleus the size of a cherry. Surrounding this, eighty-eight electrons each the size of a pea. Let the peas be arranged in eleven groups of eight each, so that each pea of the outer eight is 50 yd. from the central cherry and 20 yd. from its neighbor of the same group. Let the inner groups be equally spaced from one another and from the central cherry.

The nucleus has a positive charge equal to the charges of the eighty-eight negative electrons. The whole system is held together by electric forces of attraction and repulsion. The small compact electropositive nucleus, in turn, is apparently made up of eighty-eight single

units of the primitive material of the universe—positive electricity. Atoms of other elements are similarly constituted, but simpler, since the atom of radium is one of the very largest. The hydrogen atom consists of a single unit nucleus and one electron, while the helium atom, the next larger, has two electrons.

Atomic systems in general are stable, but in the case of some of the largest and most complex ones, like that of radium, something occasionally goes wrong and the atom disintegrates with a violence a hundred thousand times as great as that of the explosion of an equal mass of TNT. The fragments of the explosion of a radium atom are an atom of helium, an atom of emanation and electrons. This in brief, is the picture furnished by the disintegration hypothesis proposed in 1903 by Rutherford and Soddy.

This modern conception of an atom gives a clear insight into a great variety of chemical matters. Take, for example, the explanation of chemical union. All chemical and most physical properties of an atom depend upon the electrons surrounding its nucleus. Let us assume that the outer ring of an atom can lose or gain one or more electrons. An atom of elementary sodium, let us say, has a strong tendency to lose an electron, and an atom of chlorine, on the other hand, has a tendency to take up an extra electron. If we bring the elements together, they react violently, as we know, and produce sodium chloride—common salt. All the characteristic properties of each element has disappeared. Why? Because the sodium metal owes its metallic properties and its intense reactivity to the tendency of each of its atoms to lose one electron. The terrific effect of chlorine is solely due to its power to extract electrons from any source capable of giving up electrons. In each molecule of salt we have a sodium atom minus one electron and therefore positively charged, associated with a chlorine atom plus one electron, which gives it a negative charge. The two parts of the molecule hold together by reason of the electrical attraction between positive and negative charges. The older explanation of the union was that chlorine has a strong affinity for sodium. But this is all wrong. If Smith lends Jones \$10 and you see Smith continually dogging Jones, is it because of the love or affinity of Smith for Jones? Not at all. Smith is attracted only by the \$10 he lent Jones!

The valence of an element is the number of electrons its atom can lose or gain in chemical reactions.

ISOTOPIC ELEMENTS

The nucleus is the seat of mass and likewise of radioactive changes. In addition to positive electricity, the nuclei of the larger atoms contain a few electrons. In some cases two different nuclei have the same excess positive charge, but one nucleus has a greater number of positive units and a correspondingly greater number of electrons than the other. The result is most astonishing. These different nuclei hold exactly the same numbers of external electrons. Chemically, the atoms are identical. But their nuclei are different and in consequence they differ in atomic weight and in the nature of their radioactive changes, if they are active.

Prior to the discovery of radium it was never suspected that atoms having different mass could be chemically identified. Among radioactive elements many cases of this kind are well known. For example mesothorium, a perfectly definite radioactive element of atomic weight 223.4, is completely identical in chemical properties with radium of atomic weight 226, so much

so that once the two are mixed they cannot be separated. If it had not been for their radioactivity, in which they differ widely, they never would have been recognized as distinct elements. Elements of this sort are called isotopes. Isotopes have the same net nuclear charge and therefore the same number of external electrons. Among radioactive substances many isotopes are known.

But is it not only among radioactive elements that isotopes exist. Thanks to the researches of Aston, of Harkins and of Dempster, we now are learning that several of the most familiar elements, such as chlorine, magnesium and mercury, are isotopic mixtures.

TRANSMUTATION OF NITROGEN

Although radioactive changes involve transmutations of elements, it must not be forgotten that such processes are spontaneous and completely independent of all physical and chemical conditions. Man is apparently unable to start, stop, hasten or retard any radioactive change. Still in recent years chemists have often seriously considered the question: Can atoms not naturally radioactive be disintegrated or transformed? This indeed is the old problem of alchemy in a more modern setting. About ten or twelve years ago Ramsay thought he had answered the question in the affirmative in the supposed change of copper into lithium under the influence of the rays of radium emanation. But the critical repetition of the experiment by Mme. Curie proved that the lithium found came from other sources.

Recognizing clearly that only the most intense force can possibly penetrate to the nucleus of an atom and so disrupt it, Rutherford made the attack on the problem of the transmutation of nitrogen with the most powerful means known to science—the helium nuclei shot out by the radioactive element thorium C. Their velocity is 14,000 miles a second. When one of these finds an atom of nitrogen directly in its path, it goes straight through the field of outlying electrons, assaults the citadels of the nitrogen nucleus and knocks out fragments. In some cases these are nuclei of hydrogen atoms, in other cases nuclei of a hitherto unknown sort three times as large. What then does this mean in less technical terms? Simply this: This element nitrogen, which is not radioactive, has been transformed into hydrogen and a new element. This is a real transmutation of a common element. Such a transmutation is of purely scientific interest at present. But who dares discount the future?

Atomic disintegration involves two principal things—the production of new kinds of elements and the liberation in part of the internal energy of the atom. The amount of the latter is startlingly great. For example, the atomic energy of a single ounce of one of the heavier elements like lead or uranium is equal to that of ten tons of coal. If it ever becomes possible in future to induce the disintegration of ordinary elements, the value to humanity will come in greater measure from the limitless stores of energy thus placed at man's command than from the possible production of precious metals.

VALUE OF THE DISCOVERY OF RADIUM

I have tried to point out some of the epoch-making developments that have taken place in our science as the result of the discovery of radium. These are some of the fruits of Mme. Curie's work. For the world in general the use of radium in medicine has an even greater human interest. If there had been no scientific achievements the gift to medicine of this powerful thera-

peutic agent would alone entitle this discovery to take an exalted position. When we add to all this the fact that the discovery has given to chemical technology an industry which in America has an annual output worth \$4,000,000, there is but one conclusion: The discovery of radium is the most conspicuous single chemical event of this generation.

All honor to the illustrious discoverer, Mme. Marie Sklodowska Curie.

Prof. R. A. Millikan's Address, "For Physics"

On an occasion which is so rare as this—namely, an occasion on which Mme. Curie is delivering the only address which she makes on this trip to America—I am sure you do not wish me to take any time in giving out words even from the standpoint of physics or from the standpoint of America. I shall therefore do nothing more than to express my delight and that of my fellow physicists in paying our tribute of respect and honor and admiration to one who has contributed to all our sciences, one whom I am proud to say has the title of Experimental Physicist in a university of Paris and one whose discovery has touched not only physics but also chemistry, astronomy, geology and, what is much more important, philosophy. The opening up of the mind of man to the possibilities of this world, due to the discovery of radium, is certainly a philosophical event of immense importance. It seems to me therefore that this occasion tonight is one which represents the word "co-operation" in an unusual way. It represents the co-operation among all the physical sciences, which is to be, I think, the watchword of the decade upon which we are now entering. It also represents co-operation in the mission of bringing forward the progress of civilization by the progress of science, through the magnificent effort by the women of this country in assisting Mme. Curie with the great resources which we happen to have.

Prof. T. C. Chamberlain's Address, "For Geology"

I cannot tell you very well the contribution which the discovery of radium and of radioactivity has made to geology without telling you a little of the struggle through which it has been passing, for it is the contribution of radium and radioactivity to the relief of our difficulties that constitutes its essential contribution to our science.

In the closing years of the last century some of the very fundamental ideas of earth's science seemed to be slipping away, as the severer tests of the dynamics of our planet were brought to bear upon them. It was relatively easy for our forefathers to tell us how matter might be gathered into a globe and how that globe might have some sort of revolution, but it proves to be quite another thing to tell us how matter could be gathered together in a series of globes that should revolve in relation one to another and to their controlling sun in the very peculiar and singular way in which our planets act.

Hypothesis after hypothesis was brought up and tested and failed. It was amended and tested again and failed, and so on, until at length a hypothesis quite distinct from the others in its dynamic qualities was found which seemed to meet the rigorous requirements.

Then it was necessary to test this new hypothesis on other accounts to see if there did not lurk within it somewhere a fatal deficiency such as had been found in the others. One of the first of these tests to present

itself was the question of "adequacy of heat." The old hypothesis had started with the fiery beginning and a surplus of temperature. The new hypothesis was that of an earth built up slowly, very slowly, small particles coming in in such a way as to lose the heat of the impact before it was communicated to the body of the earth, and so the earth grew up like an ash bed—cold, or relatively cold. Whence, then, the heat indicated by volcanic action and other sources? Whence, then the great heat that we supposed to reside in the interior of the earth?

DISCOVERY OF RADIUM SOLVES MANY GEOLOGIC PROBLEMS

It was in this stage of solicitude when there came information of the wonderful heat-producing powers of radioactive substances, and so at once there came joy and satisfaction from this new discovery. There was no longer any question about the adequacy of heat in the earth or the moon or in any of the bodies that had encompassed radioactive substances in their formation. On the contrary, a difficulty of precisely the opposite source arose. Just as soon as the examination of the surface of the earth had reached an adequate stage it was found that the radioactive material, though very minor in its quantitative amount, was very effective in its heat-producing power. If the center of the earth, if the whole body of the earth, were permeated by radioactive substances as plentifully as the accessible portion, the annual product of heat would be very much greater than the earth is giving forth at the present time. And so there followed the almost necessary inference that the earth must be growing hotter all the time and must have been growing hotter all the time.

Now this conclusion is directly opposed to the geological evidence, and the geological evidence is strong. How, then, is this difficulty, this enforced difficulty, to be met? The only obvious way is to suppose that the radioactive substance is concentrated toward the surface and the quantitative value of its heat-producing power was such that less than one-hundredth of the thickness of the earth's crust would contain a sufficient amount of radium to produce all the heat that the earth is giving forth from the interior annually.

Now, according to the inherited concepts of the interior of the earth, it was once at least in a fluid condition. Some have held that it still is largely fluid. But the radioactive material, being of the heaviest order, ought to have concentrated in the center and not at the surface.

Here was a radical difficulty, but this gave us no trouble, because we had previously abandoned the whole concept of a fluid earth and a fluid interior, and substituted for it a very different concept, a concept which rested upon the stress conditions of the interior. There exists three million times as much static pressure in the center as at the surface, and, besides that, there is a whole group of pulsating stresses in operation due chiefly to outside sources and whose resultants were ten times, or thereabout, as great in the deep interior as at the surface. Thus it is obvious that if there were spots all through the earth possessing a liquefying agency, it would follow as a consequent mechanical condition in so fast and in so far as these little spots became liquid, or the local adjacent region became liquid. Then these would be squeezed to the surface, carrying the little heaters with its own currents of liquefaction. Here, then, was a mechanism peculiarly well adapted to pick

up and bring to the surface every radioactive substance in the interior of the earth and lodge it at the surface. Dr. Boulliet, who has written a fine work on geology and radioactivity, borrows this hypothesis and very discreetly says nothing about the difficulty of the old theories.

During the last half of the last century we were sorely belabored by Lord Kelvin and many other great and able physicists and some astronomers, because, as they said, we drew too largely on the bank of time. They had studied long and intently the heat energy of the sun and had found it adequate only to maintain the present output of the sun's heat for twenty or thirty million years, or some such period. They assured us that we were extravagant and must restrain ourselves, and so, bowing to these apparently strong arguments, we were under duress. But radioactivity has completely changed this attitude, and now there is no question about the possible adequacy of the energy in the sun or in the stars or in the earth to maintain the activities which we actually observe.

Radioactivity has brought to us another very precious instrument of great power, an instrument by which we may measure epochs and eras with an accuracy, I think, far greater than before. Geologists have studied the rate of physical and life processes of all sorts and have attempted from these to form some estimate of the age of the various formations and the age of the earth, but these are subject to serious question, because we live in an age just after a great organic revolution by which mountains tipped over and continents emerged. Radioactivity, by the rate of its decomposition, has given a mode which is entirely independent of these conditions. It gives a time measure four, five, six times as great perhaps as the geological methods, but in my judgment these are more nearly accurate than our older methods. So, singularly enough, the discovery of radium and of radioactive processes gives us one of the most needed means for measurement of time.

The discovery of radium and radioactivity has come to us at critical times and has brought us joy and satisfaction, given us instruments of power, and conferred upon us a benefit it is difficult for us to estimate.

E. B. Frost's Address, "For Astronomy"

Mr. Frost stated that there is no group of scientists that has greater interest in the discovery of new elements than astronomers—particularly astro-physicists.

He cited the case of helium, which has so remarkable a relation to radium, and outlined the conditions under which two astro-physicists, a Frenchman and an Englishman, working independently during the solar eclipse of 1868, one in India and the other in England, each detected the presence of a never before identified slender beautiful line in the spectrum of the edge of the sun. A new element was thus discovered, which, they guessed, came very close after hydrogen in the series of chemical elements, and they even surmised some of its properties. But it was only after twenty-seven years that helium was identified in terrestrial sources.

Nebular Orion, shining with its peculiar bluish green light, and spread over enormous space, emits light from which the astro-physicists have identified a gas they call nebulum. The speaker hoped that some day some discoverer with the skill of Mme. Curie would find that gas in some of the products of the earth.

Referring to radium, he stated that it has been something of a disappointment to find that there is no spectroscopic evidence of the presence of radium in the sun.

The work of the speaker on the identification of radium emanations in the solar sphere has not proved successful; some lines have been identified, but the intensities do not match, and some lines which should be there have not been detected. Thus the astro-physicists, when conservative and cautious, are not in a position to identify conclusively the presence of radium in celestial bodies.

Dr. W. A. Pusey's Address, "For Medicine"

I am glad to testify to our indebtedness to the honored guest of this evening for the discovery of radium, because its biological effects are no less interesting than its other amazing qualities. These biological effects were discovered very soon after concentrated radium salts had been produced by Mme. Curie, and tradition has it that it occurred when Prof. Curie himself, carrying radium in his pocket, discovered that it produced a sore. It was not very long after this that the study of these biological effects began and they led to extraordinary results. If the surface of the skin, which is the easiest living tissue to study, is exposed to radium, there is no change for eight to ten days. Where the reaction is slight it is confined to reddening. If the exposure has been longer or more intense, blisters occur on the surface. If it is carried beyond this point, the tissues of the skin are destroyed and in its maximum effect deep ulcers are formed.

The phenomena as studied under the microscope are not less interesting. First, in the mildest degree there is an inflammation; when carried a little further, certain cells are damaged that first show a disturbance of function, then a disturbance of structure, and then, if it is carried beyond this, absolute destruction of certain of the cells. These cells look as though they had been bombarded and broken into fragments. Other cells at this stage of the process will be able, if the process does not go too far, to be restored to normal, but a loss of certain sensitive cells takes place. If the process is carried to its maximum, you get complete destruction of all tissues, everything down to and including bone.

Radium has no effect on dead skin, no more than ordinary light. These phenomena, as they are produced by radium and X-rays, are absolutely unique.

Their application to medicine lies in the fact that radium has a selective effect upon the tissues. Certain diseased tissues are readily damaged. Young cells and those which are highly differentiated and whose functions are special are particularly sensitive to the effects of radium. Through the utilization of this variation in sensibility to the effect of radium we have been able to do very much with radium in the treatment of disease. It has given us new methods of great convenience and effectiveness in handling some diseases we could handle before and it has given us methods in handling some diseases we could not successfully handle before. It has given us a new means of attack on cancer. It has not solved the cancer problem, it has not taken the place of surgery, but it has given us a means of controlling many cases of cancer that we could not control, and of alleviating some cases and of saving patients from the terrors of operations in others.

The work, as you may well imagine, is but in its beginning. Nobody can tell what the effects of radium on therapeutics is going to be, but even at the present time medicine owes a great debt to the discoverer of radium, and we are glad to do homage to Mme. Curie as one of those rare people who have discovered valuable new agents for the attack upon disease.

Dr. Lewis then introduced Prof. Julius Stieglitz of the University of Chicago, Dean of the American Chemical Society, Chicago Section, who was chosen to convey to Mme. Curie the Gibbs Medal.

Presentation of the Medal by Prof. Stieglitz

In choosing the name of our medal of honor the Chicago Section of the American Chemical Society sought to commemorate the work of the man whom we considered the greatest chemist America has ever produced, Willard Gibbs, the pioneer in physical chemistry. The first medal was bestowed upon Svante Arrhenius, a pioneer in the field of ionization, who developed a theory which for twenty or twenty-five years cleared up a great mass of what otherwise would appear as unconnected complicated facts. Great as were the discoveries of Gibbs and of Arrhenius, even greater, Mme. Curie, were the discoveries, the contributions to science which you have made, for you turned the key to the lock behind which the deepest and most fundamental secrets of nature were kept, the secrets of the subatomic world. We who lived in the time when atoms were considered whole and unchangeable can best appreciate the tremendous wonder of what has been accomplished in the last twenty-five years through the discoveries which you developed and through which you led the world of physics and chemistry. The story of the tracing of the pinhead of radium through a ton of pitchblende and other ores is more interesting, more profoundly moving, than any story of conquest on the face of the earth. It is a story of unflagging courage, of persistent self-sacrificing effort, and in gratitude for your work the Chicago Section of the American Chemical Society has asked me to present to you, as a token of its esteem and reverence, this medal, the Willard Gibbs Medal of 1921.

THE WILLARD GIBBS MEDAL

May you take it and esteem it, you and yours, in the same way as do those who are giving it to you, as homage to your courage, to your self-sacrifice and to one of the most lasting and greatest achievements in science which we have to commemorate in our generation. This is your medal, Mme. Curie, from the Chicago Section of the American Chemical Society.

Address of Mme. Curie

I wish to thank the American Chemical Society for having expressed its appreciation of my work by bestowing upon me the Gibbs Medal. I consider it an honor to be present at a meeting of the society which has elected me to membership several years ago. It is also a satisfaction to me to meet here Prof. Millikan, Prof. McCoy, and others whose work in atomic science and in radioactivity I know and highly appreciate.

It was the wish of the society that in this address I

should speak of my early work and give you a short account concerning the discovery of radium. It would be a great pleasure for me to do so, and I think that Prof. McCoy has already given you a view of the various developments of the new science of radioactivity.

The work was begun in the year 1897. At that time Prof. Curie and I were working in the laboratory of the School of Physics and Chemistry in Paris. I was engaged in the study of the uranium rays, which had been discovered two years before by Prof. Henri Becquerel. Becquerel found that uranium salts emit continuously special rays very different from ordinary light, but similar in some properties to X-rays. These rays are able, like X-rays, to make an impression on a photographic plate through an envelope of black paper protecting it from ordinary light, and these rays may also produce conductivity of air, they may produce a discharge, because the air which the rays are penetrating has acquired a force called ionization.

This property of uranium, emitting rays which are similar to those in the X-ray tube, was of course a very strange property and it was natural for me to try to know what it was. The first thing to do was to find a good method for measuring the intensity of those rays. These could be measured by the rate of discharge of an electroscope under suitable conditions, but I preferred a method which seems to me more accurate and rapid, consisting in measuring the same conductivity and ionization by a compensation method using an electrometer. I shall not describe this in detail, because it has been given in several of our publications.

Those measurements were very reliable. Tested in such a way, the property of radiation by uranium proved a very regular one, a steady one. What was more, it was proved that it belonged to all the compounds of uranium in every state and increased with the amount of uranium in the compound. And so I was compelled to come to the conclusion that the emission was an atomic property of the element uranium. This property of matter consisting in the emission of rays has been called radioactivity.

A HUNT FOR RADIOACTIVE ELEMENTS

Then the second question I asked myself was whether the element uranium was the only one possessing the property of radioactivity. In order to settle that I undertook an extensive examination of all kinds of elements and their compounds to ascertain if there was any other element which would possess atomic radioactivity. The only one I found was thorium. Radioactivity is high in both uranium and thorium, but this is their only common characteristic. Those two have the greatest atomic weight, but otherwise they have no particular analogies.

In my general examinations of so many chemical products, I had taken not only the pure elements and their compounds, but also some natural products, ores and minerals, and it is then that I came face to face with quite unexpected facts. I expected, of course, that all minerals containing uranium and thorium—and very often the same minerals contain both elements—would be radioactive, but it seemed also from my point of view that none of them ought to have as much radioactivity as pure uranium or thorium oxide. But what I found was quite different! I found several minerals that had stronger radioactivity than the oxides of thorium and uranium, the ratio being as high as four in the case of one sample of pitchblende. In order to explain this

abnormal behavior of minerals, I admitted that in those minerals was contained some new element with an atomic radioactivity much stronger than that of uranium and thorium and which could be present in the minerals only in a very small proportion, because they were not detected in the analysis of the minerals. This particular hypothesis has been verified by the discovery of polonium and radium by Prof. Curie and me.

Prof. Curie and I then started a common work for the separation of that new element. We were guided in our work by chemical analysis of the mineral accompanied by measurements of radioactivity. As some products on analysis proved more and more radioactive, we knew that we had succeeded in concentrating the new element, and during the year 1898 we were able to establish the existence of at least two new radioactive elements which were called, the first polonium, being separated with the bismuth, the other one radium, being separated with the barium.

Our purpose was to get these elements in a pure state, because if that could not be done chemical science would not have accepted our statements about the new elements. The difficulty was that the quantity of polonium and radium in the mineral was so exceedingly small. I considered it equal to about 1 per cent in quantity, but now we know that the quantity of radium which really is present in uranium ore is not even one part of a million in a good ore and the quantity of polonium is even much smaller. So that to get a quantity of radium one is obliged to work up huge quantities of ore, a very difficult task for a laboratory.

LACK OF EQUIPMENT, HELP AND MONEY

It must be said also that at the time we did not even have a good laboratory, a good chemical laboratory. We had a place to do some work and we had at our disposal a kind of shed which was not a laboratory at all, only a shed—no chemical arrangements where we could try to do the necessary work for the separation.

The second difficulty was that at the beginning we had no help of any kind and no money. That was also a very difficult condition under which to do that work, and it is just because the conditions were so difficult that the work was not done as quickly as it could have been done under other conditions.

The separation of radium, of course, could have been done within a period of several months, or at least less than a year, but it took us really four years to get the radium completely pure. Even at that time we could not buy pitchblende in sufficient quantity, but we had the idea that radium must be concentrated in the residues of the pitchblende after the extraction of uranium, and we contrived to get a certain quantity at the factory of the Austrian Government, where pitchblende was treated for the extraction of uranium. These residues had no value at that time and were thrown away, but this was the ore that we used. We succeeded in treating quantities up to 50 kg., but it is very difficult to do this kind of work with this quantity in a laboratory. We were obliged to give up doing it that way and to try to get the rough treatment done elsewhere and only the end of the work on the concentrated product was done in the laboratory.

It is not necessary to explain all the details of the work. It is sufficient to say that the proceeding was just the same as that that would be needed to extract barium from pitchblende, because radium belongs to the barium group. The work was centered on the ex-

traction of radium, because this was easier than getting polonium.

The radium extracted with the barium forms a barium-radium salt in which the concentration of radium is indeed exceedingly small. I do not think it could have been determined by ordinary means of chemical examination at that time. It could be deduced only by measurements of radioactivity.

In order to concentrate the radium in that barium-radium salt I devised a method of fractional crystallization. I found that if a solution of barium-radium-chloride is allowed to crystallize, the radium percentage in the barium-radium salt is several times greater for the crystals than for the solution. On that principle a regular working scheme can be established, leading to a very satisfactory separation of radium and barium by a sufficient number of crystallizations, if only the quantity of radium is not too exceedingly small. The crystallization of bromide may also be used with some advantage.

I myself did the numerous crystallizations that were wanted to produce the first pure radium. It was in the year 1902 that I succeeded for the first time in getting nearly 100 mg. of pure, very pure, radium chloride. The purifications by concentration have been all the time accompanied by measurements of radioactivity on the one side, by spectroscopy, and by determinations of the atomic weight of the matter present in the salt. That is also an ordinary chemical matter.

As the concentration in radium was increasing new lines appeared in the spectrum, while the barium lines weakened and disappeared, and the mean atomic weight of the metal, determined by the same method which is used for barium, increased to a limit which I determined to be 226. The atomic weight of barium from which we had started was, as is well known, 137.

So at last the end had been reached, and established without doubt that radium was a new chemical element in the same meaning as every chemical element is. We held the absolute proof that radium is a new chemical element and that the initial hypothesis was justified. These results also have been corroborated by many other scientists.

SEPARATION OF RADIUM METAL

Later I was also able to separate the radium in the metallic state. This was a still more difficult work, because radium is an element which decomposes water very strongly, and I also had a very small quantity of radium. It was always only those 100 mg. which have served.

The separation of radium in the metallic state has been done in the same way as it is done with barium, because the elements are so similar. The groundwork was prepared by the use of an electrolytic solution of radium chloride. After reduction this has been heated in very pure hydrogen, the mercury distilled away and in that way the radium metal has been left as a white metal, like barium. That work is extremely dangerous to the safety of radium, which, as you know, is a very precious material. This experiment has never been repeated by any one else in the world so far as has come to my knowledge.

You may see that the conditions in which this work has been done were from many points of view not easy conditions. Later they have improved. The laboratory which I have now is a new laboratory very much better equipped than ever before. Now I believe that my work

will be made even more efficient and more thorough by the interest which your country has so generously given.

The special interest of radium is, as you know, in the intensity of the rays, which is more than a million times greater than the intensity of the uranium rays. It is because of that that the effects of radium rays are so important.

Particular attention has been given, as you have been just told, to the physiological effects of the rays and which were discovered for the first time, as you have heard, in France. It was also in France that the first work of radium therapy was started, which is also sometimes called Curie therapy. This made necessary the production of radium, and so the supply of radium has been provided by factories of which the first has been also started in France.

The first radium came from France, but now America is the biggest producer. Many grams of radium are manufactured every year from the great quantities of Colorado carnotite. The methods used for the extraction of radium are always nearly the same as those which have been devised in our laboratory. All of these methods and all the ways and means and details of the preparation have been already published by Prof. Curie and by myself, for the benefit of science and humanity.

Radium is now a commercial product, but the quantities for sale are not controlled by its weight. It is much more convenient for a substance which is so precious and sold generally in small quantities, to control these quantities by the measurement of the intensity of radiation made under proper conditions, and particularly by comparison with the radiation of a known quantity of radium. So a number of the scientists of different countries decided that it was necessary to have an international standard of radium to make reliable measurement in all countries, and I was intrusted with the preparation of that standard. That was done in the year 1911, when the international standard of radium was prepared in the shape of a small glass tube containing 22 mg. of very pure, anhydrous radium chloride prepared for the determination of the atomic weight. This international standard is deposited at the International Bureau of Weights and Measures near Paris, and it is used only for comparison with secondary standards to be deposited in national institutes in the different countries.

RAYs FROM RADIUM

During the years when all this chemical investigation was going on, a great deal of work was also devoted to the study of the rays. This work has been done not only by us but by many other scientists, among them Henri Becquerel, Prof. Rutherford, Villard and others. Three kinds of rays have been identified and designated as the alpha, beta and gamma rays. These letters correspond exactly to the three sets of rays which are to be found in an X-ray tube. That is indeed a very curious coincidence.

The alpha rays are positive rays. We know now that they are atoms of helium, carrying a positive charge and traveling with a great velocity, one-twentieth of the velocity of light. The beta rays are not atoms, but electrons—that is, particles nearly 1,800 times smaller than the mass of hydrogen atoms and carrying a unit charge of negative electricity. The speed may come very near to the velocity of light and of course is greater than the speed of the alpha rays. The third, which are gamma rays, are not corpuscular, they are an electro-

magnetic vibration similar to light and to X-rays, but having a much greater frequency.

The penetrating power of the rays varies greatly. The alpha rays have a very small power of penetration and are very easily absorbed even by an ordinary sheet of paper. The beta rays may travel through several millimeters of aluminum, and the gamma rays may even penetrate much more dense material, like lead.

TRANSFORMATION OF RADIOACTIVE ELEMENTS

I have already told you that besides radium many other radioactive elements have been discovered, and in all cases the same method of chemical radioactive analysis has been used.

The emission of the rays is followed by a transformation of the element. Having expelled either the alpha ray, which is a helium atom, or the beta ray, which is an electron, the atom is changed into an atom of a different kind. These transformations go on until another element is obtained, which is no more radioactive. The theory of these transformations is a very important achievement of Rutherford and Soddy.

For any radioactive element the proportion of atoms destroyed in a given time always remains the same. The time required for the destruction of half of the atoms is a characteristic constant of the element and is called the period. The shorter this period the shorter is what is called the average life of the element. If this average life is very long, the element may still exist in the earth even if its formation has taken place before the actual constitution of the earth's crust—that is, more than a thousand million years ago. This is the case of uranium and thorium. All the other radioactive elements, including radium, have rates of disintegration too large to enable them to survive geological time and they are present in the minerals only because they are continuously produced by a chain of transformations beginning either at uranium or at thorium.

These chains are named "families" and all members of the family are present in the ancient minerals of uranium and thorium. In these minerals a state of equilibrium has been reached. Radium, for instance, is a product of the disintegration of uranium, and the period being 1,600 years, the quantity accumulated in the ore is a little more than three parts of radium to ten million parts of uranium.

We find the element may be more easily found and isolated if its average life is longer than if its average life is shorter. The quantity of polonium is 5,000 times smaller, polonium being also a product of the series starting from uranium, but with a period of only 140 days, and this explains why we could succeed in isolating radium but not polonium. I even can have the hope that polonium will be isolated in the very near future. The most we have had, and then only once, was a tenth of a milligram of polonium, and several milligrams of some material with which it was mixed, and that was a material which was extremely radioactive, much more radioactive than radium. Of course it was not pure polonium, and the purification has not been effected.

In the series from uranium we have a long-lived radio element, ionium, discovered in this country by Prof. Boltwood and known for being the direct parent of radium. It is an intermedium between uranium and radium. It was produced from uranium and that element could be isolated if only it could be quite free of thorium. To the same series belong actinium, discovered in France by Dr. Debierne. In the same family we

find short-lived radioactive gases or emanations and of the products of their transformations. Radium emanation is the most important, because it has been isolated in the pure state and because it has received an important medical utilization. Even if it is short-lived, it nevertheless has been isolated and because it is a gas it is easier separated. Its spectrum has been obtained and determined in the pure state. It can be separated from radium and for several purposes its use is more convenient than that of radium.

In the thorium family we find mesothorium and radiothorium, both produced in reduction plants as by-products in the winning of thorium. They are also used for many purposes. We have also thorium emanation, which is a radioactive gas.

The end products of both families are helium and at least two kinds of isotopic lead.

The radioactive elements are long-lived or short-lived, and the chemist must consider the evidence to determine whether their life be long as uranium, or if it should be very short, as that of some emanations or some product of their transformations. Every substance of that kind is an element and has definite chemical properties. For that reason it has been possible to introduce these elements in the periodic classification. In Mendeléeff's table all the radioactive elements, which are more than thirty in number, occupy ten places, beginning with lead and finishing with uranium. Of course there are only ten places but there are more than thirty elements. The explanation for this is to be found in that several elements occupy the same place, and these are elements which are called isotopic, having such very similar chemical properties that they can't be separated. From the chemical point of view this classification is entirely satisfactory, because the properties of the elements are just these which can be expected from an element belonging to that special place. The first place, which was a new place, has been occupied of course by radium. No one element was at that place at that time. After the discovery of radium it fitted very exactly in the periodic classification where it belongs by its atomic weight and by its properties. Of the other radioactive elements several came in places which were already occupied by other elements—for example, lead, or uranium, or thorium.

CHEMISTRY OF RADIOACTIVE ELEMENTS

In this way we establish what may be called the chemistry of radio elements. It is a specialized chemistry, but though chemistry in its designation, as far as the means of investigation are concerned, it is all very special chemistry, entirely different from the chemistry of the ordinary elements. The methods of investigation are not at all the same. The quantities of radioactive material are so extremely small that they are absolutely beyond determination by any mechanical method which does not depend on electrical measurements. Quantities of radium which may be detected, for example, are less than a ten-thousandth of a milligram, which is not approached by any mechanical method of measurement. It is because of that that we always measure our radioactive substances by its radioactivity and do not try to weigh it. Therefore this study could be in a way called the chemistry of what is invisible. It is an expression which could be applied to a great part of this chemistry which has been started by the discovery of radium and polonium and achieved by the joint work of distinguished scientists of all the world.

National Lime Association Convention

New Features in Kiln Construction—Chemical Control the Key to Kiln Efficiency—Modern Plant at Rockland, Me.—Standardization—Research—Lime in Water Purification—The Plasticimeter—Chemical Department Accomplishments and Plans

THE third annual convention of the National Lime Association was held at the Hotel Commodore, New York, June 15 to 17. The program covered all phases of the association's activities—lime production problems, extending the use of lime in the construction, agricultural and chemical fields, and details of association work.

NEW FEATURES IN LIMEKILN CONSTRUCTION

Richard K. Meade read a very interesting paper on new features in limekiln construction.¹ These developments were visualized by a set of lantern slides showing kilns in which the steel shell was replaced by reinforced concrete, the application of hand stokers to shaft kilns, and the installation of rotary kilns at the Eastern Potash Corporation's plant near New Brunswick, N. J. This plant will have a capacity of 1,000 tons of lime a day, limestone being obtained from extensive deposits in Sussex Co., N. J., near McAfee. The lime will be used to treat greensand for the production of caustic potash and a residue which will be used in the manufacture of high-grade building brick.

CHEMICAL CONTROL THE KEY TO KILN EFFICIENCY

W. D. Mount called attention to a fact which is perhaps not generally appreciated—namely, that the alkali manufacturers using the ammonia soda process are among the most important producers of lime. With the best high-grade calcium stone about 1.2 tons of limestone is required per ton of soda ash. In 1918 the production of alkali in this country was equivalent to 2,500,000 tons of soda ash. Using a conservative ratio of 1.3 tons of limestone, this amount of soda ash would call for 3,250,000 tons of limestone or 1,625,000 tons of lime. The commercial production of lime in 1918 was 3,204,000 tons, from which it will be seen that the lime used by the alkali manufacturers was equal to one-half of that burned for commercial purposes.

It is therefore of interest to consider the methods of lime burning employed in this industry. Being part of a great chemical industry, every phase of this work is under complete chemical control.

The limekilns are usually quite high in proportion to the diameter, ranging from 60 to 70 ft., with an internal diameter from one-sixth to one-seventh of the height. They are operated under induced draft, and coke is used as fuel, being charged direct with the stone. Extreme care is taken in adjusting the ratio of coke to stone and also in the sizing of each—a 6-in. cube represents the normal maximum size for the stone and a 2½-in. cube for the coke. The correct ratio of coke to stone is determined by analysis of the coke and adjustment of the burden (coke to stone ratio) until the maximum volume per cent of CO₂ is obtained consistent with a well-burned lime. The gases are analyzed hourly and

temperatures are measured by recording pyrometers. Since both the lime and the CO₂ are used in the process close chemical control is absolutely essential in order to maintain the efficiency of subsequent operations and also to keep down costs.

With a high-calcium, free-burning stone and with coke low in sulphur and containing less than 8 per cent ash, fuel ratios as high as 1 ton of coke to 12 or 13 tons of stone are not uncommon monthly averages. These figures may be compared with the theoretical data for a kiln operating under ideal conditions—that is, cold at top and bottom, continuous discharge, fuel burned in direct contact with the stone, perfect heat conservation.

Taking the heat of decomposition of CaCO₃ as 775 B.t.u. per lb., 1 ton of limestone will require 1,550,000 B.t.u. The average temperature of the stone as charged will probably approximate 50 deg. F. and its specific heat 0.22, hence the temperature range is $1904 - 50 = 1,854$ deg., and the heat required to bring the stone to the decomposition temperature is $1,854 \times 2,000 \times 0.22 = 816,000$ B.t.u. The total heat required is thus 2,366,000 B.t.u. One ton of coke will yield on burning 29,000,000 B.t.u., or enough heat to decompose 12.26 tons of stone under ideal conditions.

It will be noted that results obtained by the alkali manufacturers as regards fuel economy are apparently in excess of those indicated under the ideal conditions assumed. However, it may be pointed out that the stone charged will probably average 95 per cent CaCO₃, and that the decomposition is only about 95 per cent complete, so that we have $13 \times 0.95 \times 0.95 = 11.73$, indicating a kiln efficiency of 96 per cent.

MODERN PLANT AT ROCKLAND, ME.

George B. Wood, president of the Rockland & Rockport Lime Corporation, described the company's new plant which is nearing completion at Rockland, Me.

The plant comprises a battery of six Mount kilns with two Morgan mechanical producers centrally located. Provision has been made for the subsequent erection of two additional kilns at each end to make a future battery of ten. The kilns are 10 ft. outside diameter and 75 ft. high above foundations. The top 20 ft. of the kiln is unlined and holds a reserve storage of 45 tons of rock, which is charged through an air-tight charging bell operated by compressed air. Air for combustion is drawn from the bottom of the kiln through the hot lime below the fires, preheating the air before meeting the gas and thoroughly cooling the lime before it discharges from the kiln. The lime discharges continuously through an annular opening at the bottom of the cooling cone onto a slowly revolving circular table. The speed of the table determines the rate of discharge and may be regulated for each kiln independently through the simple shift of a lever.

A conveyor carries the lime to the storage and packing building, where it is first run over a bar grizzly to separate the fines. The lump lime is then sorted by

¹Some of the features were covered by Mr. Meade in the series of articles which appeared in CHEM. & MET. ENG., vol. 23, p. 841, Oct. 27, 1920; p. 873, Nov. 3, 1920; p. 929, Nov. 10, 1920.

hand into selected lump lime and common lime. Four 500-ton overhead steel storage bins keep the lime in first-class condition until ready for shipment or packing.

STANDARDIZATION

The luncheon address on Wednesday was delivered by Dr. S. W. Stratton, director of the Bureau of Standards. He spoke on the relation of standardization to Government research and industrial development.

Standardization is essential to the intelligent use of materials, and the development of specifications or standards of quality is particularly important in this connection. Before the process of standardization can begin a set of definitions must be formulated and accepted by all concerned. Then in making the specifications it should be borne in mind that three groups are involved: Those who make the materials, those who use the materials and those who made the specifications. No one of these groups should attempt to draw up specifications without consulting the others. In bringing together the user and the manufacturer, the Bureau of Standards has found that many of the disputes which arose over matters of sentiment or tradition could be solved conclusively in the laboratory.

THE BUSINESS OUTLOOK

On Thursday the luncheon address was given by Wallace A. Booth, vice-president, Guaranty Trust Co., New York City. Mr. Booth reviewed recent developments in this country and abroad and from this very comprehensive survey of factors influencing business drew the conclusion that the prospect for a steady return to normal conditions is decidedly more hopeful than it was a year ago.

DEPENDENCE OF MODERN INDUSTRY ON RESEARCH

Dr. Arthur D. Little discussed the dependence of modern industry on research, with special reference to the lime industry. He introduced the subject by a very entertaining summary of the wide variety of forms in which calcium carbonate is found in nature—the transparent calcite or Iceland spar used for optical purposes, marble, pearls, and the great limestone, chalk and coral formations which are due to countless millions of minute organisms, particularly foraminifera, globigerina, and the coral polyps.

Turning to lime manufacture, Dr. Little pointed out that the industry was already indebted to science for more than 60 per cent of its market. Many of the problems which still confront the lime burner will be solved by science. Improved kiln design is dependent upon the application of physico-chemical principles, and the quality of the product must be controlled by chemical and physical tests. Different lines of the same chemical composition exhibit wide variations in their physical characteristics. Thus some high-test limes are found to be only 80 per cent available when used for causticizing; in making bleaching powder one lime may absorb 25 per cent more chlorine than another of the same chemical composition, and similar variations are found in practically all of the applications of lime. For certain purposes the little-understood property of plasticity is of prime importance, and Dr. Little called attention to the work that was being done on this subject by Warren E. Emley at the Bureau of Standards and Prof. Bingham at Lafayette.

The progress which has been made in kiln construction is an excellent example of the practical value of

research. Old-style kilns produced probably not more than 2 tons of lime per ton of coal, while the ratio in modern kilns is greater than 6:1.

LIME IN WATER PURIFICATION

Certain phases of the use of lime in water purification were taken up by C. Arthur Brown of the American Steel & Wire Co. Eighteen years' experience with the lime:ferrous sulphate method of water purification has convinced Mr. Brown that this application is capable of considerable extension. At present about 120 municipal water-purification plants in the United States consume 55,000 tons of lime per annum. It is estimated that between 30 and 40 per cent of the water-purification systems in the country could use lime profitably. Projecting the consumption curves forward, this would mean a demand for 346,000 tons of lime in 1931. However, an approach to this figure can be attained only through an educational campaign designed to increase public appreciation of the value of soft water for domestic purposes.

PLASTICIMETER

Since 1910 the Bureau of Standards has experimented with many types of apparatus for the measurement of plasticity and twenty-one different machines have been built. The latest step in this evolution was demonstrated by Warren E. Emley. This plasticimeter gives a numerical result and is thus more suitable for obtaining comparable records than the Carson blotter test.

Sufficient water is added to the sample to make a good workable mix. A cylinder of the mixture $1\frac{1}{2}$ in. high x 3 in. in diameter is placed in the machine between a specially prepared base plate having a definite absorptive value and a disk which is free to turn but cannot move upward. The absorbent plate rests on a permanent base plate which is simultaneously rotated and elevated by means of suitable gearing. As the base and specimen turn, the friction of the specimen on the disk causes it to turn and this motion winds up a cord attached to a pendulum. The maximum force developed is measured on a scale attached to the pendulum and from this figure and the time required a plasticity figure is calculated.

Samples of hydrate were sent to several plasterers with the request that they rank them according to plasticity as determined from practical test. In every case their opinions checked the results which had been obtained by the plasticimeter. The machine has thus demonstrated its value as a means of distinguishing masons' hydrate from finishing hydrate.

CHEMICAL DEPARTMENT ACCOMPLISHMENTS AND PLANS

Dr. M. E. Holmes, manager of the chemical department of the association, reviewed the work which had been done during the year and the plans for the future.

The chemical uses of lime have been neglected and the problem of extending present uses and developing new ones offers many opportunities for interesting and profitable research. Rapid strides in this direction are being made through studies at the association's laboratories and through co-operation with university, industrial and Government laboratories. During the year the chemical department issued Lime Brief 250, "Outline of the Process of Lime Manufacture," which includes an excellent flow sheet. It is planned to follow this with a brief on the distribution of the uses of lime in agriculture, construction, and over 100 chemical industries.

Meeting of the New Jersey Clay Workers

Report of the Summer Joint Meeting at Trenton, N. J., of the New Jersey Clay Workers' Association and Eastern Section of the American Ceramic Society, June 17, 1921

THE regular summer meeting of the New Jersey Clay Workers' Association and Eastern Section of the American Ceramic Society was held at Trenton, N. J., on Friday, June 17, with morning and afternoon sessions. As in the case of previous years, the Trenton Country Club was selected for the gathering, and there is no doubt that this choice is a happy one in making for a delightful environment for the event.

With President Abel Hansen in the chair, the meeting was called to order close to 11 o'clock, and getting right down to business, Charles Howell Cook, chairman of the executive committee of the association, was called upon for a report relative to the new ceramic school and research station at Rutgers College.

Mr. Cook said that the contract had just been awarded to the Franklin M. Harris Co., Philadelphia, Pa., for the erection of the building, at a price of \$73,877, and ground will be broken at an early date. Other contracts for plumbing, heating, lighting, etc., also have been let, including an award to the New Jersey Terra Cotta Co., Perth Amboy, for terra cotta at a price of \$6,955. The total appropriation of \$100,000 granted by the State Legislature will be absorbed in the construction, and contributions aggregating \$25,000 are expected from the different manufacturers of ceramic products in the state to provide necessary materials as well as proposed equipment. Mr. Cook made an urgent plea to interest the young men of the state in the new ceramic school building and the opportunity to be presented for instruction in ceramic engineering under the direction of Prof. George H. Brown.

The first paper on the program was by William Burgess of the United States Potters' Association on the subject of the tariff, and through necessary absence at Washington, the paper was read by R. H. Minton.

Setting forth that tariff revision, at best, is a difficult matter, Mr. Burgess explained that from first-hand

knowledge gathered upon visits to England, France, Germany, Austria, Holland, Belgium, Japan and China, he has been impressed with the urgent need for a fair tariff to protect the pottery industries of the United States. Not only do low wages prevail in these countries, but conditions under which goods are produced are decidedly different from those here.

With a wage scale of 70c. an hour in the United States, those in the various other countries mentioned are: Great Britain, 18c.; France, 15c.; Holland, 13c.; Germany, 6 to 7c.; and Japan, 4 to 5c. While women are employed in the pottery industry in the United States, largely in the decorating shops, the aggregate is about one-third of the total number of operatives. In England it is one-half, and in Germany and central Europe about two-thirds. In these countries the women do much of the heavier work, such as placing kilns and the like, handled in the United States by men.

In Japan, in addition to the employment of a large number of women, many small boys are engaged, largely in decorating work, at a very nominal wage. Even the best of Japanese workers, such as may handle the big jigger, receive at the maximum 85c. a day of twelve hours, while the women earn from 20 to 25c. a day.

Explaining in detail how goods were being brought into the United States with low duty, through invoicing at about one-half the proper value, Mr. Burgess urged a basis for assessing duties so that the American wholesale selling value will be taken in place of the foreign market value, and said that the present Ways and Means Committee at Washington was giving serious consideration to such a plan.

In conclusion, he set forth that it is not the desire of any of the pottery manufacturers to prohibit the importation of foreign ware of any kind, but so to hold it in check that the American producer can obtain a fair share of the market. Previous to the outbreak of the

war the United States did not supply more than 45 per cent of the consumption of this country; during the war period the pottery industry developed under extreme pressure so that up to six months ago the United States manufacturer was supplying upward of 60 per cent of the demand.

HOLLOW BUILDING TILE

The second and concluding paper of the morning session comprised a short illustrated talk on the subject of "Hollow Building Tile," by Walter A. Hull, Bureau of Standards, Washington, D. C.

He spoke of the work now being conducted at the bureau to ascertain the different characteristics of hollow building tile, the operations being carried out in close co-operation with the Hollow Building Tile Association and its different members. He pointed out that the matter of fire resistance of hollow tile was one of primary importance, and showed a number of lantern slides illustrating the tests for this work at the bureau.

Again, consideration has been given to the relation of fire resistance to other physical properties of the material, such as absorption, strength at different temperatures, expansion, etc. With substantial and encouraging progress being made, he said that the end would be the placing of the industry upon the right footing with respect to other building commodities. This is the big goal that is sought.

FACTORY PREPARATION AND BURNING OF WHITEWARE BODIES

Following an enjoyable luncheon, the larger part of the afternoon session was given over to a highly interesting and illuminating talk by Prof. A. S. Watts, Ohio State University, Columbus, on the subject of "The Factory Preparation and Burning of Whiteware Bodies."

The topic was treated at great length, dealing with the work in its different stages, as (1) raw materials; (2) mixing the body; (3) preparation of stain; (4) equipment; (5) setting the kiln; and (6) firing the kiln. With respect to the grinding of raw materials, he said that fine grinding reduces the amount of feldspar and ball clay, which should improve the color of the ware. With respect to the frequent question, "Does fine grinding cause cracking?" he said that this is a disputed subject, but the raw body is made more dense, which may cause cracking. If the ball clay can be reduced, the tendency to crack should be reduced. The European porcelains do not contain any ball clay.

To clean dirty ball clay properly, Prof. Watts said that it should be dried at not over 100 deg. F., and then plunged into nine times its weight of water. After that, it should be screened through a 150-mesh sieve, and used on a stop weight basis.

With respect to mixing the body, he said that the best practice was to introduce the ball clay slip into a large ball mill, with one-third charge of pebbles; then add the feldspar and flint. Add additional water, if necessary to make a thin slip. Then grind two to three hours; add stain and china clay, and grind to point of mix only.

Mr. Watts gave a number of interesting references at this point with regard to cobalt stain in whiteware bodies. He spoke about the faulty methods of adding cobalt, resulting in a blue gray cast when the body is hard fired. The correct preparation of stain from cobalt sulphate was explained, and the adding of the

stain to the body. Reference also was made to the proper proportions of stain to the body, and the use of stains in glazes.

With regard to equipment, he compared rotary and shaking sieves, pointing out the features of merit of the different types. Slip pumps and compression tanks were then considered, and he urged that pumps should not be operated at too high speed.

In the matter of filter presses, it was pointed out that maximum pressure for a good working body was an item of much importance. He recommended that this be 80 lb. for a body free from ball clay, with an addition of 2 lb. for each 2 per cent of ball clay present. For instance, a 100-lb. pressure for a body containing 10 per cent ball clay; 110-lb. pressure for a body with 15 per cent of ball clay, and so on. When the press stops running water, the pressure should be increased 10 lb. for a few minutes before opening the press.

Speaking of the aging of clay and its effect, Mr. Watts said that this develops plasticity by fermentation. Aging causes fine gas cavities, and accordingly is not to be recommended for electrical porcelain production. The clay cellar should be maintained at a temperature above 80 deg. F. and 90 per cent relative humidity.

Dealing with the subject of pug mills, it was brought out that for every body there is only one satisfactory rate of travel through any given pug mill with a given size and shape of outlet. A slower rate produces an open body, and a faster rate produces a granular weak body, due to the friction in the mill. The control is by the regulation of the number of knives in the mill and the slope of the knife blades. All blades should slope the same, for if the top knife, for instance, is sloped the most, the lower blades are only a hindrance and cause heating.

In setting the kiln, Mr. Watts said that in his experience the first and second rings should be set 1 in. apart except midway between the cuts, and the inside rings all set 1 in. apart. A 1-in. opening should be left between all rings, and not more than 6 in. should be left between the top bungs and crown at any point.

In updraft kilns, the well-hole should equal the sum of the cross-sections of the flues leading to it. In such case the center ring of saggers can run to 6 in. below the crown if braced properly. In the matter of downdraft kilns, the center of the kilns may be set 12 to 15 in. below the crown, and the burn improved with an opening provided from top to bottom in center.

Speaking of the firing of the kiln, with particular reference to hard fire porcelain, free from ball clay, he said that with the body biscuit, the fire may progress as fast as the coal will burn, maintaining a condition bordering on reduction from the time the kiln is hot enough to develop such characteristic, or from about the tenth hour. For the best results, the fuel beds never should burn low enough to permit air leakage, as a highly oxidizing condition is as dangerous as a condition of extreme reduction, and results in blue and cream ware instead of white. The temperature is dropped fast after finish to an orange red.

VISITS TO POTTERIES

The meeting was adjourned about 4 o'clock to allow time to visit local potteries, and automobiles were provided for the members and guests, with choice of selection between the new plant of Lenox, Inc., manufacturer of fine chinaware, and the new sanitary ware plant of the Mutual Potteries Co.

Meeting of Society of Testing Materials at Asbury Park

Sulphur or Phosphorus Limits Raised on Structural Steel and Steel Castings—Tentative Standards for Metallographic Testing of Iron and Steel Proposed—Impact Testing Given Special Consideration in Session on Steel and Wrought Iron

ABOUT six hundred members of the American Society for Testing Materials unsuccessfully attempted to dodge the prevailing hot wave by assembling at Asbury Park last week. Unfortunately the breeze was from the land most of the time, and the summer is too young to have tempered the frigid Atlantic. Nevertheless the usual number of committee meetings and general sessions drew a large attendance.

SULPHUR AND PHOSPHORUS IN STEEL

The committee on steel presented a voluminous report recommending changes or additions to forty-four standards, mostly in an attempt to remove ambiguity from the existing wording or to permit acceptance of steel made by duplex or more complicated processes. Furthermore, the note regarding sulphur and phosphorus limits was removed on ten of the fourteen specifications on which it yet remained.

It will be remembered that due to the difficulty in getting low-sulphur fuels and melting stock and the increasing scarcity of low-phosphorus ores, a war emergency measure was passed by the society, temporarily increasing the limiting percentages 0.01 per cent on a considerable number of standards. It was stipulated, however, that this was done merely to enable the large volume of steel required for war purposes to be produced within recognized specifications, and the original analyses would be restored with the passing of the emergency. Consequently a year ago the note was removed from all but fourteen of the standards, these fourteen, however, including the "tonnage materials"—rails, structural steel, rivet material and tubes.

Meanwhile an ambitious program of experiments had been begun by a joint committee of interested organizations (of which the Society for Testing Materials was one) to determine the effect of residual sulphur and phosphorus in otherwise normal open-hearth rolled steel products. It was felt that this investigation would supply numerical and precise data, which are now almost wholly missing from the literature, on the specific effect of these elements; numerical data which would enable the society to decide intelligently whether it would be safe to permit a permanent increase in sulphur and phosphorus tolerances. Owing to the great amount of work which this joint committee has laid out, its findings have not yet been completed, notwithstanding vigorous prosecution of the tests. It is understood, however, that those on rivet steel (sulphurs ranging up to 0.17 per cent) have been completed by the Watertown Arsenal and the Naval Experiment Station, and will be published by the Bureau of Standards as soon as they can be collated and analyzed.

BOTH LIMITS EXTENDED

In view of all the facts, however, the committee on steel decided that it would involve no danger to extend permanently the sulphur limits from 0.05 to 0.06 per cent on structural steel for locomotives, cars and ships,

owing to the heavy tonnages involved and to the continued difficulty in obtaining low-sulphur fuels and melting stock. Phosphorus and sulphur were both extended 0.01 per cent for steel castings, for the same reason. It is worthy of remark that the sulphur limit is now reduced on all materials which are to be worked hot (rivets, tubes and chain) and increased on structural materials which are to be fabricated cold.

STEEL RAILS

A proposal for a new tentative specification for "special quality" rails, closely following those recently adopted by the American Railway Engineering Association, was under consideration. This would be an addition to the present standard—a second specification which should be favored by heavy traffic railroads. However, the steel committee refused to recommend its adoption, in view of very diverse opinions on the manufacturing minutiae responsible for sound rails and the doubt as to whether the more rigid test requirements would produce rails which would unquestionably stand severe traffic more successfully.

TESTS OF STEEL AT HIGH TEMPERATURES

Much interest was shown in the paper by R. S. MacPherran on "Comparative Tests of Steels at High Temperatures" published on page 1153 of this issue. Albert P. Spooner of the Bethlehem Steel Co. described some work in progress in that company's laboratory, quite independent of that by Mr. MacPherran but with a very similar instrumental equipment. He gave some curves from both laboratories, plotted in comparison, which showed substantial parallelism, the difference being easily accounted for by minor differences in chemical composition or previous treatment. Nearly all the curves for tensile strength show a valley between 200 and 400 deg. C. (an occurrence which has not yet been given a rational explanation) and a peak between 600 and 800 deg. C., usually higher than the strength at room temperature, and then on higher temperature a very sudden drop. Reduction-of-area curves are quite generally opposite, showing minima where those for tensile strength have maxima. Mr. Spooner also noted that high-alloy steels broken at elevated temperatures appeared as if they had been burned, but microscopic examination showed that this was not the case; however, fracture in those cases was intercrystalline.

H. J. French called attention to work of several former investigators on this subject, and pointed out that the maxima in the tensile strength curves had been found at a considerably lower temperature than those reported by Mr. MacPherran. In view of the difficulty of producing a zone of uniform temperature, even without the effect of large masses of metal conducting heat out the ends of the furnace at a rapid rate, he recommended that a special study be made to determine whether there was not uniformly plus error in the recorded temperatures.

ATMOSPHERIC CORROSION

Committee A-5 on corrosion of iron and steel reported that the test on uncoated sheets exposed in the Pittsburgh district for the last five years is nearing completion.

"The results of the observations at the Pittsburgh tests have now reached a point where we may definitely conclude that copper-bearing metal shows marked superiority in rust-resisting properties as compared to non-copper-bearing metal of substantially the same general composition, from which superiority we may truly anticipate a marked increase in the service life for copper-bearing metals under atmospheric exposure of uncoated sheets.

"It is interesting to note in this connection that the A and O groups of sheets, the light gage non-copper-bearing bessemer and open-hearth metals, which failed first at Pittsburgh, have also failed first at Fort Sheridan, which would indicate that the two different atmospheric conditions have shown substantially the same general tendencies, only with varying rates of corrosion."

A summary of results of the Pittsburgh tests follows. It should be noted that iron or steel containing less than 0.15 per cent copper have been classed as "non-copper bearing." Also that no 16-gage sheet containing 0.06 per cent copper or more has failed. In other words, of 175 16-gage sheets analyzing 0.06 copper or more, not one has failed in Pittsburgh atmosphere after 52 months' exposure. Of 83 16-gage sheets analyzing 0.3 copper or less, 54, or 65 per cent, have failed:

Type Designation	Gage	Number of Groups	Total Number of Sheets	Number Failed	Total Failures at Each Inspection, Expressed as Percentages of Total Sheets of Each Type Exposed							
					10 Mo.	16 Mo.	22 Mo.	28 Mo.	35 Mo.	41 Mo.	46 Mo.	52 Mo.
Copper-bearing.....	16	14	132	None	None	None	None	10.3	15.9	26.2	32.6	42.9
Non-copper-bearing.....	16	11	126	54	None	None	None	4.1	13.7	27.4	44.5	63.7
Copper-bearing.....	22	15	146	93	None	None	1.4	91.6	94.0	96.4	96.4	97.6
Non-copper-bearing.....	22	11	84	82	None	35.7	79.7					

Before starting the Pittsburgh test, pieces were sheared from the edges for preservation. Small rectangles were later cut from these trimmings, and immersed in water pumped from the Calumet mine containing much sulphuric acid, iron and aluminum sulphates. Failure was reported after ¼ in. indentation from the edge, or a perforation. Results on 16-gage sheets are tabulated below:

	Average Life in Days	
	Copper Greater Than 0.15	Copper Less Than 0.15
Bessemer steel.....	124	135
Open-hearth steel.....	113	114
Pure iron.....	99	124
Wrought iron.....	128	158

"In the imersion tests under the conditions which prevail at the Calumet mine, the presence of copper would indicate little influence on the life of the specimen and if any difference, the presence of copper would seem to give a slightly shorter life, also the order of failure of the various groups is decidedly changed, but it would be safer not to draw definite conclusions until we have the finished results of the various atmospheric and immersion tests."

IMPACT TESTS ON CAST STEEL

"Some Impact Tests on Cast Steel" were presented by F. C. Langenberg. In one investigation a heat of normal steel from a side-blown converter was selected, and half of it poured into a preheated ladle containing

a certain amount of 20 per cent ferrophosphorus. Castings were then made from both the normal and the phosphorized steel. Castings were annealed at 950 deg. C. for two hours, air-cooled, and drawn four hours at 500 deg. C. Tests follow:

Mark	Analysis					Charpy Impact
	C	Mn	Si	S	P	
5775	0.42	0.86	0.20	0.065	0.043	6.69
5775X	0.42	0.86	0.20	0.065	0.104	3.10
5807A	0.42	0.65	0.28	0.069	0.043	5.46
5807B	0.40	0.63	0.30	0.069	0.058	4.65
5807C	0.42	0.60	0.27	0.066	0.068	3.56
5807D	0.41	0.61	0.27	0.065	0.075	2.40

Little difference was noted in the results of the ordinary static tests, except that 5807 D was somewhat lacking in ductility.

A second investigation was on a series of high manganese castings, air-cooled from 900 deg. C. The extraordinarily high impact value of 30 or more was noted from those which analyzed 0.22 to 0.30 C and 1.08 to 1.29 Mn. Higher carbons with lower manganese, or *vice versa*, lowered the Charpy figure greatly.

An acid open-hearth casting containing C 0.30 per cent, Mn 0.62, Si 0.18, S 0.038 and P 0.038 was given three heat-treatments as follows:

A: Quenched in water from 900 deg. C.; drawn two hours at 650 deg. C. and furnace-cooled. B: Furnace-cooled from 900 deg. C. C: Air-cooled from 950 deg. C., drawn two hours at 500 deg. C. and furnace-cooled. Physical properties follow:

Heat-Treatment	Yield Point	Tensile Strength	Elonga-gation	Con-traction	Charpy Impact	Brinell Hardness
A	57,500	87,333	15.3	22.8	14.25	176
B	46,333	79,333	18.3	27.2	11.32	156
C	49,500	82,666	16.2	23.9	11.87	159

C. E. Margerum pointed out that many steel objects intended to resist impact are hardened. Single-blow impact tests on such material are misleading, since hardness (a desirable quality) and internal flaws (an undesirable quality) both reduce the amount of energy necessary to break the specimen. In an effort to translate the foot-pounds at rupture to a force required to break the specimen, the author has devised a simple apparatus, as follows:

A hammer, falling at a controlled speed, strikes a plunger, capable of limited vertical motion, the lower end of which is formed into a yoke, and which transmits the blow to the ends of the specimen. The test-piece is 0.35 x 0.35 x 1.75 in., resting on a central support, which in turn rocks on a hardened 10-mm. steel ball. Supporting all this is a record bar, calibrated with the same ball (after the fashion of the Brinell test) by static pressure. The force existing on the central bearing at the instant of rupture may then be taken from the calibration curve, after measuring the indentation made by the ball. A series of tests on 1.08 per cent C tool steel shows the greatest impact strength after a draw ranging from 570 to 700 deg. C. If the same apparatus is used in a compression machine, holding each increment of load two minutes, the "static strength" is 40 to 60 per cent less for these draws.

Sir Robert Hadfield, Fritz Medalist

IT IS doubtless unnecessary to remind American engineers that the John Fritz award was instituted twenty years ago by the American societies of Civil, Mining, Mechanical and Electrical Engineers, and the first medal bestowed upon its namesake on his eightieth birthday. Designed to perpetuate that genial iron master's achievements in technology, particularly mechanical engineering applied to steel manufacture, it has become the most coveted honor at the disposal of American engineers and has been bestowed upon the following eminent scientists and engineers:

Lord Kelvin, George Westinghouse, Alexander Graham Bell, Thomas Alva Edison, Charles T. Porter, Alfred Nobel, Sir William Henry White, Robert W. Hunt, John Edson Sweet, James Douglas, Elihu Thomson, Henry Marion Howe, J. Waldo Smith, George W. Goethals, Orville Wright.

During the past year it has been the ambition of the board of award to express the obligation which American engineers feel not only for the terrible sacrifices made by the engineers of Great Britain in the war, but for their great engineering achievements for the preservation of civilization. It ultimately found expression in making Sir Robert Hadfield the next John Fritz Medalist, not only for his personal achievements, especially the invention of manganese steel, but through him, to his brother-engineers. A deputation of representative Americans, including Ambrose Swasey, Ira N. Hollis, Charles T. Main, F. B. Jewett, Christopher R. Corning, Arthur S. Dwight, John R. Freeman and Charles F. Rand, will bear this message of good cheer to the other side, and present the medal on June 29, during the meeting of the Institution of Civil Engineers of Great Britain, in London. Far from a jealous feeling that such an honor should go beyond our boundaries, nothing but good will and cordiality accompany it, and the wish that the problems of reconstruction may be as effectively surmounted as those of the great war!

Sir Robert Hadfield, although born in Sheffield, Yorkshire, in the year 1859, comes from the Derbyshire family of that name who live at Edale. This quaint Derbyshire village is surrounded by the Kinderscout Hills, almost mountains, from 1,800 to 2,000 ft. in height. It is the center described both by Mrs. Humphry Ward in "David Grieve," and Charlotte Brontë in her novel "Jane Eyre." Edale is not far from historic Castleton, celebrated by Sir Walter Scott in his "Peveril of the Peak,"

with its Mam Tor, Win Hill, the Shivering Mountain, the famous Blue John mine and other fascinating places of historic interest. Chatsworth, Haddon Hall and Rowsley are all within hailing distance, and through these Derbyshire vales flows the well-known River Derwent of Isaak Walton fame.

Young Hadfield was educated at Sheffield Collegiate School, where he obtained in 1874 two scholarships and prizes in natural science. In 1876 he entered the laboratory of his father's works, and at the age of twenty-three discovered the remarkable properties of manganese steel. Another very important invention—low hysteresis steel, which is also saving the electrical trades many millions of dollars annually—was made a few years later. More recent research has been particularly successful in the line of development of heavy

armor-piercing projectiles, and light body armor. In 1888 he became chairman and managing director of Hadfields, Ltd., which post he has continuously held. Despite the demands upon a busy executive, he has never lost his keen interest in fundamental metallurgical research. In fact, his important contributions to scientific literature number 128 in all, and cover, often in encyclopaedic manner, such subjects as manganese and alloy steels, sound ingots, corrosion, research, physical testing, microscopic and X-ray examinations, ancient and modern metallurgical history, shorthand (Sir Robert makes free use of this method in handling his voluminous correspondence), patents, and the labor question. That his interest in the latter is not entirely academic may be inferred from the fact that he introduced the forty-eight-hour week at the Hadfield works in 1891.

His honorary memberships and fellowships, awards, presidencies, vice-presidencies and degrees are far too numerous to catalog. Among the most notable might be mentioned Master Cutler of Sheffield, 1899-1900; president of the Iron and Steel Institute, 1905-1907; president of the Faraday Society, 1914-1920; Bessemer Medalist and special gold medal from Société d'Encouragement pour l'Industrie Nationale. He received special letters of thanks from the Prime Minister and the French Ambassador for services rendered to the nation during the war, in connection with the Hadfield Hospital at Wimereux, near Boulogne, and for which he was entirely responsible from November, 1914, to January, 1919; during this time no less than 16,300 cases were dealt with; also from the Minister of Munitions (Winston S. Churchill) for services rendered as a member of the advisory panel of the Munitions Inventions Department.

SIR ROBERT HADFIELD

Pipe-Line Transportation of Hot Oil

A Study of Thermal Losses in Hot Petroleum Transit Lines — Calculations Based on d'Arcy's Hydraulic Formula for Spacing Pumping and Heating Stations — Curves of Hydraulic Gradient for Insulated and Uninsulated 8-In. Lines

BY LEONARD L. BARRETT*

IT IS the object of this paper to calculate the effect of applying insulating coverings to hot oil pipe lines such as are found in the California, Texas and Mexican fields, and to deduce the economic results to be obtained by such practice. In order that such calculations may be of value they must be based on correct data and must be in such form that the methods can be followed and applied by engineers who may be called upon to lay out the design of pipe lines. In addition, therefore, to attempting to carry out the main purpose of this paper an effort has been made to compile the results of the best practice in pipe-line design and to elucidate the application of the methods described.

The rate of heat loss from a hot oil pipe line has a governing effect upon the location of stations. As the temperature of the oil drops due to loss of heat by radiation, the viscosity of the oil increases rapidly and a point is reached where it becomes necessary to install a pumping station and heaters to force the oil along. The low specific heat of crude oil, approximately 0.5, accounts in a measure for the rapidity with which the oil drops in temperature during its passage through the pipe line, because for a given loss of heat the temperature of the oil will drop twice as fast as would that of water.

The heat loss from a heated surface varies with the difference in temperature of the surface and the surrounding air. In oil pipe lines where the oil is heated to 170 deg. F. and discharged around 100 deg. F. the temperature difference between the pipe and the air (or earth) will vary generally from 30 to 100 deg. F. In passing through varied country a ditched line unprotected by insulation meets with varied radiation losses.

THERMAL LOSSES IN TRANSIT LINES

The loss from such a line is vastly increased during rainy periods when the ground is full of moisture which leads the heat away from the pipe line by conduction. In such cases it is very difficult to estimate the terminal and intermediate temperatures of the oil in advance of the construction of the line. The use of a suitable insulating covering on the pipe line will in large measure nullify the effect of these variations, thus adding greatly to the reliability of temperature determinations in advance of construction. The chief virtue of such a covering is, however, to be found in the enormous heat saving which is effected. The oil retains its heat much longer and the costly pumping and heating stations which form the principal element of cost in pipe-line construction and maintenance can be spaced considerably further apart. When it is considered that one of these stations costs in the neighborhood of \$300,000 this aspect becomes most important. The

reason for this saving in heat is to be found in the fact that the conductivity of a 1 in. thickness of 85 per cent magnesia covering per square foot of pipe surface per hour per degree temperature difference averages 0.45 B.t.u. for temperature differences between 25 and 125 deg. F., while the bare pipe loss in air is between four and five times as much and the ditched pipe loss lies between the two and may exceed that in air if the ground is wet.

The questions to be considered are: (a) How much further will the heat carry in an insulated line than in a bare line, and (b) how much further apart can stations be spaced if the line be insulated? The proper spacing of stations must be determined by the hydraulic formula.

CALCULATION OF THE FLOW OF VISCOUS FLUIDS

The formula we shall use is the d'Arcy formula as modified by Prof. W. F. Durand for use with viscous fluids.¹

Let u = viscosity in absolute units;

ρ = density, lb. per cu.ft.;

D = diameter of pipe in feet;

L = length of pipe in feet;

v = velocity, feet per second;

p = loss in pressure head due to friction, in lb. per sq.in.

The formula may then be put in the form

$$p = \frac{f \rho v^2 L}{288 g D} \quad (1)$$

where f is a function of $\frac{D \rho v}{u}$ defined by $f = \phi \left(\frac{D \rho v}{u} \right)$

Prof. Durand has shown that where the value of $\frac{D \rho v}{u}$ is less than 2,000 there will be stream line or sinuous flow,

and in such case $f = \frac{64 u}{D \rho v}$. Where the value of $\frac{D \rho v}{u}$ exceeds 2,000 there will be turbulent flow and the value of f in such case is given by the following table:

$\frac{D \rho v}{u}$	f	$\frac{D \rho v}{u}$	f
2,500	0.0442	12,000	0.0304
3,000	0.0426	14,000	0.0292
3,500	0.0412	16,000	0.0280
4,000	0.0400	18,000	0.0271
4,500	0.0390	20,000	0.0264
5,000	0.0382	25,000	0.0249
6,000	0.0364	30,000	0.0238
7,000	0.0350	35,000	0.0228
8,000	0.0340	40,000	0.0219
9,000	0.0330	45,000	0.0213
10,000	0.0320	50,000	0.0208

In order to be on the side of safety in design the value 0.0442 should be taken for f when the value of $\frac{D \rho v}{u}$ is 2,000.

It will be observed from equation 1 that the loss of

pressure in any section of a given pipe line of constant diameter will vary with both the viscosity and the density of the oil in that particular section. It will not do to assume a constant viscosity and density throughout the length of the pipe line, as both these quantities vary with the temperature of the oil and the temperature is dropping continuously as the oil proceeds from one pumping station to the next. The viscosity, particularly, increases so rapidly as the temperature is reduced that we have very different conditions in the various sections of the same line. For these reasons the loss of head will be computed from point to point along the line. The variations referred to may give rise to such pronounced effects that while we may have turbulent flow at the beginning of a line where the oil is warmest, a point will be reached further along the pipe where the flow will become stream line in character as the temperature decreases and the viscosity rises. An example of such a case will be given later on.

SPACING OF PUMPING STATIONS

The following steps are necessary for the solution of the question regarding the spacing of stations. They are:

(1) The construction of a curve showing the temperature of the oil as a function of distance traveled.

(2) The construction of curves showing the viscosity and density of the oil as a function of distance traveled.

(3) The construction of curves showing the values of $\frac{Dv_o}{u}$ and of f as a function of the distance.

(4) The construction of a curve showing the pressure in the pipe line as a function of the distance. This curve gives the hydraulic gradient. The point of intersection of the hydraulic gradient with the line representing zero pressure gives the location of the next pumping station if the elevations are equal.

TEMPERATURE OF THE OIL DURING FLOW

Let us now develop a formula for the determination of the temperature of the oil at any point in the pipe line, as it is on this determination that all subsequent work must be based.

Let V = velocity of oil, feet per hour;

L = length of pipe, feet;

t = time required for oil to pass through L feet of pipe, hours.

w = weight of oil in 1 ft. of pipe, pounds;

T = temperature of oil at beginning of length L ;

T' = temperature of oil at end of length L ;

T'' = mean temperature difference between oil and air in length L ;

k = specific heat of oil = 0.5;

T_o = temperature of air;

Q = quantity of heat radiated from pipe of length L in time t ;

a = radiating surface of 1 ft. length of pipe, in square feet;

t' = thickness in inches of an insulating covering on a flat surface which will give the same thermal resistance as the thickness of the same material which is used on the given pipe, or the equivalent thickness of the insulating material if applied to a flat surface;

c' = conductivity of 1 in. thickness of insulation in B.t.u. per sq.ft. per hour per degree temperature difference between pipe and air;

R' = radius of outside of pipe in inches;

R'' = radius of outside surface of insulation in inches;

c = radiation from bare pipe, B.t.u. per sq.ft. per hour per degree temperature difference between pipe and air.

The radiation from L feet of bare pipe in time t will be

$$Q = acT''Lt \quad (2)$$

As the wL pounds of oil contained in the L feet of pipe will lose this same amount of heat in the time t , the temperature of the oil falling from T to T' , we may also write

$$Q = wLk(T - T') \quad (3)$$

Equating these values of Q , substituting for t its value $\frac{L}{V}$, and solving for L , we have

$$L = \frac{(T - T') Vwk}{acT''} \quad (4)$$

$$\text{Also, } T'' = \frac{T - T'}{\ln \frac{T - T_o}{T' - T_o}} \quad (5)$$

$$\therefore L = \frac{Vwk}{ac} \ln \frac{T - T_o}{T' - T_o} \quad (6)$$

Values of T'' and $\ln \frac{T - T_o}{T' - T_o}$ are given in the Table I.

Initial and Final Temperature of Oil	Temperature of Air					
	70 Deg.		80 Deg.		90 Deg.	
	T''	$\ln \frac{T - T_o}{T' - T_o}$	T''	$\ln \frac{T - T_o}{T' - T_o}$	T''	$\ln \frac{T - T_o}{T' - T_o}$
170	96	0.1044	85	0.1177	76	0.131
160	85	0.1177	76	0.131	64	0.157
150	76	0.131	64	0.157	55	0.182
140	64	0.157	55	0.182	45	0.223
130	55	0.182	45	0.223	35	0.285
120	45	0.223	35	0.285	24.5	0.4055
110	35	0.285	24.5	0.4055	14.5	0.6931
100						

Values of c for above-ground uninsulated pipes to be used in formula 6 are as follows (see *Trans. A.S.M.E.*, vol. 40, p. 674):

T''	30	40	50	60	70	80	90	100	110
c	1.90	1.92	1.95	1.99	2.03	2.07	2.11	2.15	2.22

From equation 6 we may obtain the distance the oil can be pumped before its temperature falls to T' .

In the case of an insulated pipe, equation 2 takes the form

$$Q = \frac{ac'T'Lt}{t'} \quad (7)$$

and equation 3 remains the same. The corresponding solution for L gives

$$L = \frac{(T - T') Vt'wk}{ac'T'} \quad (8)$$

Since $t' = R' \ln \frac{R''}{R'}$, and substituting for T'' its value as given by equation 5, we have

$$L = \frac{VwkR'}{ac'} \ln \frac{T - T_o}{T' - T_o} \ln \frac{R''}{R'} \quad (9)$$

Values of c' for 85 per cent magnesia to be used in

FIG. 1. 8-IN. PIPE LINE, UNINSULATED, DITCHED
25,000 bbl. of 15 deg. BÉ. per 24 hr. Initial temperature,
160 deg. F. Initial pressure, 750 lb. per sq.in.

this equation have been carefully worked out from experiments conducted at the Mellon Institute (see *Trans. A.S.M.E.*, vol. 40, p. 674) and are as follows:

T''	25	50	75	100	125
c'	0.43	0.44	0.45	0.46	0.47

TEMPERATURE-DISTANCE CURVES

As a specific example to illustrate the application of formulas 6 and 9 and to illustrate the plotting of the temperature-distance curves, let us take 15 deg. BÉ. oil with an initial temperature of 160 deg. F. and being pumped through an 8-in. line at the rate of 25,000 bbl. every twenty-four hours, and let us first determine the distance it will travel through an above-ground uninsulated pipe before its temperature falls to 150 deg. F. We have then

$$\begin{aligned} V &= 16,740; \\ w &= 0.347 \times 58.12 = 20.17; \\ T_o &= 80, T = 160, T' = 150, T'' = 76; \\ a &= 2.258; \\ c &= 2.05. \end{aligned}$$

Substituting these values in equation 6, we get $L = 4,970$ ft.

Now if the pipe be covered with a standard 85 per cent magnesia covering $1\frac{1}{4}$ in. thick, we will have

$$c' = 0.45, \text{ and } R' \ln \frac{R''}{R'} = 1.1, \text{ which substituted in}$$

equation 9 gives $L = 24,000$ ft.

The temperature-distance curves in the figures are plotted in this manner for every 10 deg. temperature difference. The values of c and c' used in each computation must be changed to accord with the value of T'' . The values of L given by equation 9 are conservative, as c' gives only the conductivity of the covering and no allowance has been made for the resistance to heat transfer from the surface of the covering to the air. Unless the air circulates so rapidly as to reduce the temperature of the surface of the covering to the same temperature as the air, this surface resistance will be an added resistance to heat loss and the length of pipe traversed by the oil before it reaches a temperature of 150 deg. F. will be somewhat greater than that given by the formula.

Expressed in a different way, we may say that equation 9 gives the length of pipe in which the temperature of the oil will fall from T to T' degrees when the wind is blowing strong enough to reduce the temperature of the outer surface of the insulation to the temperature of the air, which is the only safe condition to assume in a calculation of this sort. Equation 9 is equally appli-

cable to insulations other than magnesia provided the conductivity (c') of such insulation is known.

CALCULATIONS FOR DITCHED PIPE LINES

For the case of an uninsulated ditched pipe line equation 6 is to be used. A fair value of c to be used for ditched lines in the formula in this paper is 0.9, which will give a temperature drop of the oil in a given distance corresponding to that found in practice. The corresponding spacing of stations will be slightly in excess of that found in practice (without looping), thus affording a conservative basis for the economic comparisons to be made later on.

This value of c is too low for moist ground, as still water conducts heat about eight times as rapidly as air does. The rate of conduction is much increased if the water has any motion whatever. The fact must always be borne in mind that the value of c for a ditched line will vary with the nature of the ground. This variation is much less pronounced when the line is insulated, providing the insulation is waterproof. Applying the value $c = 0.9$ to the example we have taken and substituting in equation 6, we obtain $L = 10,900$ ft.

The case of insulated ditched lines is also handled by the use of equation 6 after the determination of a proper value of c . Assuming that the pipe is covered with a 1.25 in. thick insulating covering of conductivity 0.45 prior to filling the trench and that the heat loss from a ditched bare pipe is 0.9 B.t.u. per sq.ft. per hour per degree temperature difference of pipe and air, the computed value of c which may be used in formula 6 for the case of the pipe covered with the insulating covering and ditched the same distance under the ground is 0.28.

This value is obtained from the rational formula

$$c'' = \frac{1}{\frac{1}{c} + \frac{t'}{c'}}$$

where c' = conductivity of insulating material per inch thickness per hour per sq.ft. per degree temperature difference between pipe and air = 0.45;

c = heat loss per sq.ft. per hour per degree temperature difference between pipe and air of an uninsulated ditched pipe = 0.9;

t' = equivalent thickness of the insulating material if applied to a flat surface = 1.1 in.

THERMAL EFFICIENCIES OBTAINED IN PRACTICE

Taking the efficiency of the system as the ratio of the heat saving due to ditching or covering, or both, to the heat loss in air, the efficiency of the various systems mentioned for a temperature difference of 100 deg.

FIG. 2. 8-IN. PIPE LINE, ABOVE GROUND, INSULATED
25,000 bbl. of 15 deg. BÉ. per 24 hr. Initial temperature,
160 deg. F. Initial pressure, 750 lb. per sq.in.

between pipe and air will be found by referring to the tables of values c and c' and the value of c'' just determined for ditched lines.

- The results are as follows:
- (a) for above-ground uncovered pipe the efficiency is 0.
 - (b) For above-ground 8-in. pipe covered with 1.25-in. thick magnesia the efficiency is

$$\frac{100 (2.15) - 100 (0.46) \div 1.1}{100 (2.15)} = 80 \text{ per cent}$$

- (c) For ditched 8-in. bare pipe, the efficiency is
- $$\frac{100 (2.15) - 100 (0.9)}{100 (2.15)} = 58 \text{ per cent}$$

- (d) For ditched 8-in. pipe covered with 1.25 in. of insulation of conductivity 0.45 the efficiency is
- $$\frac{100 (2.15) - 100 (0.28)}{100 (2.15)} = 87 \text{ per cent}$$

RELIABILITY OF THE C COEFFICIENTS

Summarizing what has been said concerning the radiation coefficient, let us consider in turn the reliability of the information given for each type of system. The values of the coefficient c' as given for above-ground insulated lines are very reliable and may be used with confidence. They do not fluctuate except slightly on the side of safety when the wind losses are small. The values of c for above-ground uninsulated lines are reliable and well established. They were determined, however, for still air conditions and would increase for air in motion. The value of the coefficient for ditched uninsulated lines is subject to very large fluctuations according to the nature of the ground and is by far the least reliable. The value of c'' for ditched insulated lines also fluctuates with the nature of the ground, but to a much less extent than the coefficient for ditched uninsulated lines.

THE VISCOSITY-DISTANCE CURVE

The viscosity-distance curve is constructed from the temperature-distance curve and from the viscosity-temperature curve of the oil to be handled as determined by a laboratory test with the viscosimeter.

Where viscosities are measured by means of Saybolt times, the absolute viscosity can be found from the formula

$$\frac{u}{o} = 0.00000237t - \frac{0.00194}{t}$$

where u = viscosity in absolute units;
 o = density, lb. per cu.ft.;
 t = Saybolt time.

If no laboratory determination of the viscosity is available and only the Baumé gravity of the oil is known, the viscosities may be approximated from the following values given by Dyer for California crudes. The curves in the figures are constructed from these values:

Gravity Bé. at 60 deg. F.....	18 2	16 6	15	12 1
Density at 60 deg. F.....	58.95	59.59	60.26	61.48
Temperature, F.	Viscosity			
75.....	0.2450	0.4970	1.5670	
100.....	0.1220	0.2230	0.3440	
110.....				1.6610
125.....	0.0670	0.0990	0.1500	0.6140
150.....	0.0365	0.0490	0.0750	0.2110
175.....	0.0242	0.0245	0.0310	0.1020

THE DENSITY-DISTANCE CURVE

The density-distance curve is constructed from the temperature-distance curve by the use of formula

$$o = o' - \frac{121.2 - o'}{2713} (t - 60)$$

Where o' = density in lb. per cu.ft. at 60 deg. F.;
 o = density in lb. per cu.ft. at t deg. F.

The curve giving the value of $\frac{Dvo}{u}$ as a function of distance is then computed. Glancing at the curve for the ditched uninsulated line, it will be noted that the flow changes from turbulent to stream line at about 19,000 ft. from the beginning of the line, the value of $\frac{Dvo}{u}$ at this point being 2,000.

THE COEFFICIENT F CURVE

The curve giving the value of f is then constructed by the formula $f = \frac{64u}{Dvo}$ for values of f less than 2,000 and from the table for values of f greater than 2,000.

The pressure curve is now constructed by the use of formula 1 and the curves giving the values of f and o . The pressure drop has been computed and plotted every 20,000 ft., the value of f and o used in each case being the mean values of these quantities for the length of pipe under consideration. Glancing again at the curve for the ditched uninsulated line, it will be observed that the change from turbulent to stream-line flow causes a

FIG. 3. 8-IN. PIPE LINE, ABOVE GROUND, BARE 25,000 bbl. of 15 deg. Bé. per 24 hr. Initial temperature, 160 deg. F. Initial pressure, 750 lb. per sq.in.

point of inflection in the pressure curve, the curve changing from concave upward to concave downward at this point. In building a line the stations would be spaced a little closer together than given by the curves (assuming no looping or change in pipe sizes) in order to take care of unusual conditions in the viscosity of the oil, in the temperature of the air, and in the moisture content of the ground. As some such correction would be required on all the types of line discussed, although in the insulated lines the pressure drop would increase only due to unusual temperature or viscosity conditions, it follows that the ratio between the computed spacings is about correct and that the spacings found by the curves can be used for the purpose of comparisons of the various systems.

The distance between stations can be increased by adding a "loop" or increasing the pipe size near the end of the line. One of these expedients can always be employed, but they will not be discussed here, as they

do not affect the validity of the results arrived at or of the comparisons to be made.

DISCUSSION OF RESULTS

It is apparent from the curves in the figures that under the assumed conditions the stations on the above-ground uninsulated line can be spaced 9.85 miles apart, those on the buried uninsulated line can be spaced 13.73 miles apart, and those on the above-ground insulated line can be spaced 16.57 miles apart.

Let us now consider the economic aspects of the question. The cost of a steam-operated pumping station for 8-in. line was about \$150,000 when the report of the Federal Trade Commission on pipe-line transportation was prepared in 1916. The cost now would be about \$300,000, and such was indeed the approximate cost of recently constructed stations in Mexico. The annual operating expense and fixed charges per station, including labor, fuel, supplies, interest at 6 per cent, depreciation at 10 per cent, taxes and insurance at 5 per cent, is about \$98,000. With stations spaced every 13.73 miles and pumping at the rate of 25,000 bbl. every twenty-four hours, this amounts to 78c. per thousand barrel miles, the cost of transporting one barrel a thousand miles being the unit of cost employed in the pipe-line industry.

With stations spaced every 16.57 miles and the same rate of pumping, the cost will be 64 $\frac{1}{4}$ c. per thousand barrel miles. The cost of 1 $\frac{1}{4}$ -in. thick 85 per cent magnesia covering applied and covered with standard roofing is approximately \$3,900 per mile. The cost of ditching a pipe line is about \$900 a mile, the cost in 1910 as given by the Federal Trade Commission being \$470 per mile.

We may now form our balance sheet. Comparing an above-ground insulated line with a ditched uninsulated line, the stations in the first case being spaced 16.57 miles apart and those in the second case being spaced 13.73 miles apart, then by the use of the insulated above-ground line we have a capital saving in the original cost of stations of \$372,000 per 100 miles due to the elimination of 1.24 stations, and a saving in the cost of trenching of \$90,000, or a total of \$462,000 per 100 miles, as against a cost of \$390,000 for the necessary insulation. In addition there is a saving in operating expenses, etc., from the elimination of 1.24 stations per 100 miles, of \$122,500 per 100 miles per year, and the 1,000 barrel mile cost for pumping stations is reduced from 78c. to 64 $\frac{1}{4}$ c. The 1,000 barrel mile cost for pipe line is increased by the following charges on the insulation, interest at 6 per cent, depreciation at 10 per cent, taxes and insurance at 5 per cent, repairs at 1 per cent, or a total of \$85,800 per hundred miles of line, or 9 $\frac{3}{4}$ c. per 1,000 barrel miles.

The net savings are: a capital saving of \$72,000 per 100 miles, an annual saving of \$36,700 per 100 miles, and a saving in the 1,000 barrel mile cost of 3.85c.

The balance sheet presented was based on a comparison of a ditched uninsulated line with an above-ground insulated line, for the reason that this appears to be the most conservative and appealing comparison, because the ditched uninsulated line is the type now in general use and because the above-ground insulated line presents the simplest conditions for the application of insulating covering and at the same time gives the steadiest or least fluctuating value of the radiation coefficient.

In addition to the considerations already discussed there is also to be considered the protection of the pipe from electrolysis which is gained by placing it above ground, and the steadiness in operating conditions which is gained by eliminating all the trouble due to moist ground during rainy weather.

Setting a Recording Pyrometer for Cold-Junction Temperature

BY KIRTLAND MARSH*

A recording pyrometer of the deflection or millivoltmeter type, on which it is necessary to set the galvanometer for the cold-junction temperature of the couples connected to it, oftentimes offers considerable difficulty to an accurate cold-junction setting because the lowest graduation on the scale or chart is seldom less than 75 deg. F., while the actual cold-junction temperature is often as low as 50 deg. F. When the cold-junction temperature is higher than the lowest chart or scale division the galvanometer can be set to this temperature as closely as the instrument can be read, but when the cold-junction temperature is lower than the lowest division this setting cannot be made so accurately because there is a scale division on only one side of the setting to serve as a guide.

In many cases very little attention is paid to cold-junction settings; but for those users of pyrometers who endeavor to maintain their equipment as accurate as possible and eliminate all sources of error possible the following method for setting deflection instruments when the cold-junction temperature is lower than the lowest scale division may be of some value:

Disconnect the instrument from the couple and set the galvanometer pointer on the lowest scale or chart division. By means of a potentiometer, Wheatstone bridge or other source of a small variable e.m.f. connected to the instrument deflect the galvanometer an amount equal to the difference between the actual cold-junction temperature and the lowest scale division. With the source of e.m.f. unchanged and still connected to the instrument, reset the pointer to the lowest scale division by means of the zero adjuster. Then when the source of e.m.f. is disconnected from the instrument the zero or cold-junction setting will correspond with the actual cold-junction temperature as closely as the instrument can be read.

For example, given an instrument graduated from 75 to 1,800 deg. F. and a couple the cold junction of which, buried in the ground or in a water-cooled well, is at a temperature of 55 deg. F. With the couple disconnected, set the galvanometer pointer at 75 deg. F. and then by means of a potentiometer connected to the instrument deflect the pointer an amount equal to 75 — 55 deg., or 20 deg., when the reading of the instrument will be 75 + 20, or 95 deg. F. By means of the zero adjuster return the pointer to 75 deg. F. Then when the potentiometer is disconnected the instrument will read 75 — (75 — 55), or 55 deg. F., which is the cold-junction temperature.

Inasmuch as the pointer can be set on a scale division with great accuracy, the error of the final cold-junction setting will be the error of setting the pointer at 95 deg. F., which is less than the error of setting the pointer at 55 deg. F. directly when the lowest scale division is 75 deg. F.

*Aluminum Company of America, New Kensington, Pa.

Comparative Tests of Steels at High Temperatures*

The Tests Recorded in This Paper Were Made to Determine the Comparative Properties of Various Steels at High Temperatures With a View to Obtaining Information as to the Best Material for Use Under Operating Conditions of 600 to 1,000 Deg. F.

BY R. S. MACPHERRAN†

THE following tests were made in the laboratory of the Allis-Chalmers Manufacturing Co. to determine the comparative properties of various steels at high temperatures. The work was undertaken with a view to obtaining information as to the best material for use under operating conditions of 600 to 1,000 deg. F. A large number of these tests were made on sheet metal, turbine blading and other material too thin to allow a pyrometer head to be inserted. It was therefore decided to use for all tests a heating box in which the pyrometer head was practically in contact with the center of the test specimen.

The heating box used was 7 in. square by 9 in. high. The hole in which the test specimen was inserted was 2 in. in diameter and was lined with a core of alundum cement wound with No. 22 gage chromel wire. This wire was wound in two coils, one over the top and one over the lower half of the alundum core. They were connected in multiple. The coils were then covered with alundum cement and the box filled with magnesia. (See Fig. 1.) The couple entered at the top of the box and ran down to such a position that the point was opposite the center of the test specimen. A spring on the outside of the box forced a porcelain rod through a hole and against the base metal couple, holding the point of same against the test specimen. The temperatures were taken by a Leeds & Northrup pyrometer, using a base metal

FIG. 1. VERTICAL SECTION OF ELECTRIC HEATER

couple. The specimens used had threaded ends and were for the most part 0.505 in. in diameter. All tests were held at constant temperature for fifteen to thirty minutes before pulling. The yield points were taken by the drop of beam only and above 600 deg. F. are very uncertain.

The chrome-vanadium and chrome-nickel steels were quenched and drawn as indicated in the figures. The drawing temperatures are much above the usual, but as the tests were to be run as high as 1,300 deg. F. it was useless to draw the bars at lower than test temperatures.

*Paper read at the meeting of the American Society for Testing Materials, Asbury Park, N. J., June 24, 1921.

†With the assistance of J. F. Harper and E. H. Brown.

FIGS. 2 TO 4. PHYSICAL PROPERTIES AT HIGH TEMPERATURE OF 1-IN. ROUND, ROLLED OPEN-HEARTH STEEL

FIGS. 5 TO 7. PHYSICAL PROPERTIES AT HIGH TEMPERATURES OF CARBON AND NICKEL STEEL

Fig. 5. 3/4-in. round, rolled open-hearth steel. Fig. 6. Forged 3.25 per cent nickel steel. Fig. 7. Forged 34 per cent nickel steel.

All forged test-bars in any one series were made from one billet or piece of steel, this being hammered out into several 1-in. rounds about 30 in. in length. These latter pieces were then all heated at the same time in the same furnace and as far as possible given identical treatment. With the best of care, however, the irregularities were greater than with the rolled material tested after annealing, Fig. 8, for example, showing considerable variations in breaking loads. Fig. 9 is from rolled stock sent in by outside parties and was not treated. Figs. 2 and 3 show results of tests on carbon steel, unannealed, and Figs. 4 and 5 on carbon steel, annealed. The latter are freer from irregularities due to lack of uniformity in material and for this reason are more reliable.

While we cannot assume many definite conclusions from our limited number of tests, the following items seem to be at least probable:

1. There is no one temperature at which all steels will show a decided change in physical properties; this

point will vary in steels of different compositions or treatments.

2. The maximum tensile strength for rolled carbon steel, annealed, and forged 3.25 per cent nickel steel, annealed, occurs at between 600 and 650 deg. F.

3. The maximum tensile strength usually occurs at a higher temperature than the minimum ductility.

The majority of the tensile strength curves, especially those of heat-treated steels, drop sharply as the temperature exceeds 800 deg. F.

The effect of nickel in small amounts is slight, but in large percentages it tends to lower the temperature at which tensile strength begins to decline. Steel containing nickel is also the only steel examined where the ductility materially diminishes at the higher temperatures. It may here be noted that the same property was observed in the one set we ran of forged Monel metal bars.

The alloy steels containing chromium are less affected by rise in temperature than carbon steels. The curves

FIGS. 8 TO 10. PHYSICAL PROPERTIES OF ALLOY STEEL AT HIGH TEMPERATURES

Fig. 8. Forged chrome-nickel steel. Fig. 9. Rolled high chrome-high nickel steel. Fig. 10. Forged chrome-vanadium steel.

FIGS. 11 TO 13. PHYSICAL PROPERTIES OF ALLOY STEEL AT HIGH TEMPERATURES

Fig. 11. Forged high-chrome steel. Fig. 12. Forged high manganese steel. Fig. 13. Forged high-carbon-chrome-vanadium steel.

of the tensile loads, elongation and reduction all run out more nearly straight than in carbon steels and the maximum loads occur at higher temperatures. It is true that the carbon steels were not heat-treated and it is possible that quenching and tempering would alter the shape of these curves.

The results so far obtained would indicate that the introduction of metals forming carbides tends to strengthen steels at high temperatures.

It is interesting to note that in tests for the comparative retention of physical properties in alloy steels at 1,200 deg. F. and over, Leslie Aitchison¹ finds the order of value to be:

1. Tungsten.
2. High chromium.
3. Nickel, 3 per cent.

It would seem with higher steam pressures and increased use of internal combustion engines that the properties of the various alloy and carbon steels at high temperatures should receive further consideration.

Pulp and Paper Developments in Quebec During 1920

In a report to the Bureau of Foreign and Domestic Commerce on the paper industry of the Province of Quebec for 1920 Consul E. Haldeman Dennison, Quebec, says:

The forest industry holds second place in the province from the standpoint of value of its products, and the Quebec Government last year derived from its forest resources, principally from its pulpwood limits, over \$2,600,000, or about 15 per cent of its total revenues.

Quebec continues to lead all Canadian provinces in the pulp and paper industry. Capital to the amount of over \$100,000,000 is now invested therein. The annual combined wages of the employees amount to over \$10,000,000. The industry consumes over 1,000,000 cords of pulpwood and produces pulp and paper products to the

value of upward of \$75,000,000 annually, nearly all of which is sold in foreign markets.

The production of pulp and paper in 1920 showed a marked increase over that of the previous year. The price of newsprint at the beginning of 1920 was 3½c. per lb. and by the end of the year had risen to 6½c.

Several important developments are now under way in the province. They include the erection of new pulp and paper mills at Three Rivers by the International Paper Co., which, when completed, will have a daily capacity of 200 tons of pulp and 200 tons of paper. The Laurentide Co. is installing two new newsprint machines at Grand Mère, with a daily capacity of 350 tons of newsprint and 60 tons of board.

Four new kraft paper machines, capable of producing about twelve tons a day each, are being installed at Three Rivers by the Wayagamack Pulp and Paper Co., which will bring the total kraft production up to 100 or 115 tons a day. This company recently added 2,000 square miles to its timber limits. At Kenogami the firm of Price Bros. & Co. is adding a new 50-ton newsprint machine, increasing its newsprint output to 300 tons daily. The Howard-Smith Paper Mills at Crabtree are adding a new paper machine which will increase their output of high-grade writing paper from their two mills to 100 tons daily.

During the year the Saguenay Pulp & Paper Co. increased its output from 80 to 130 tons a day, while the Brompton Pulp & Paper Co. at East Angus is now constructing a new groundwood mill of 100 tons daily capacity. This company has recently acquired an additional tract of land comprising 90,000 acres, estimated to contain over 1,000,000 cords of pulpwood. The Belgo-Canadian Pulp & Paper Co. is also building a new groundwood mill of 40 tons daily capacity at Shawinigan Falls and making other extensive additions.

At the beginning of 1920 Canadian newsprint mills had a total capacity of 2,775 tons per day, and it is estimated that at the beginning of 1922 this capacity will have increased to 3,245 tons per day and that by 1923 Canada's newsprint production will total over 1,000,000 tons per year.

Recent Chemical & Metallurgical Patents

British Patents

For complete specifications of any British patent apply to the Superintendent British Patent Office, Southampton Buildings, Chancery Lane, London, England.

Delivering Measured Quantities of Granular Materials.—

A device for delivering measured quantities of granular materials, in which an adjustable measuring chamber *E* forming part of pivotally-mounted oscillatory cylinder *F* has an opening which is brought into register with the lower part of a chute *C* communicating with an upper hopper through a chute or tube *B*, has an adjustable piston *O* in the measure *E* encircled by a resilient ring *P* to insure a sliding fit. It is adjusted by a graduated depending stem *Q* secured in position by a clamping screw *S* carried by a bracket *B*. Supplies to the measuring chamber may be cut off by sliding plate *D*. Arms *L* engaging stops *M* limit the movement of the cylinder *F*, which discharges into chute *T*. (Br. Pat. 160,005; J. W. CROWTHER, Darlington, County Durham, May 11, 1921.)

Gas-Producer Plant.—In a gas-producer plant, the air for use in the producer is heated and charged with steam by being brought into contact with water that has been used to remove fixed ammoniacal compounds from and cool the hot gases. The gases leaving the producer 1 pass through a heat-exchanger 4, a chamber 8 having spraying nozzles 15, a tar extractor 10, a saturator 11 and a scrubber 13, finally passing away through a pipe 14. Air under the action of a fan 20 is bubbled through a hot ammoniacal solution by a device 21, passes up the lower part 19 of the scrubber, is mixed with steam, not only from the jacket 2 of the gas producer, but also from the exhaust from the engines driving the fans 10 and 20, this steam passes through a chamber 28, and the mixture of air and steam pass by a pipe 5 through the heat-exchanger 4 to the producer. Water from the nozzles 15 charged with tarry compounds and fixed ammoniacal

salts falls to a receptacle 16, in which tar is separated and the liquor flows by a pipe 18 to the lower part 19 of the scrubber, to be used to supply steam to and heat the incoming air, the liquor then being passed by a pump 22 to the spraying chamber 8. A portion of the liquor is supplied by a liquid-raising device 25 to a receptacle 24, where it is mixed with the sulphuric acid for feeding the saturator 11, hydrochloric acid and the like escaping through a pipe 26. The saturator is steam heated by a coil 27 supplied with steam from the chamber 28, which steam may be superheated in an apparatus 29 burning producer gas. Some of the water from the scrubber 13 passes through an overflow device 34 to the bottom of the lower part 19 of the scrubber. (Br. Pat. 160,151; not yet accepted; SOC. FRANCO-BELGE DE FOIRS A COKE, Brussels. May 11, 1921.)

Sodium Bicarbonate-Ammonium Chloride.—In a modified ammonia-soda process, salt and gaseous ammonia are dissolved in a mother liquor containing ammonium carbonate and ammonium chloride, and carbon dioxide, preferably pure and under pressure, is passed into the liquor until sodium bicarbonate equivalent in quantity to the salt and ammonia added is precipitated. The carbonating apparatus is provided with stirring means—e.g. of the Boulevard type—and also with a cooling system. Although the salt must be dissolved separately, it is advantageous to add some during the carbonation. The sodium bicarbonate is removed and washed and the mother liquor, after the addition of ammonia to convert the ammonium bicarbonate present to carbonate, is run to crystallizers fitted with stirrers and cooling coils. Ammonium chloride is separated at atmospheric temperature or at 5-10 deg. C., and the washing water, etc., having been added to the liquor to maintain its initial volume, the whole process is repeated. Alternately, a solution of ammonium bicarbonate prepared from wash-water by means of ammonia and carbon dioxide may be added to the saline solution of ammonium carbonate, instead of saturating successively with ammonia and carbon dioxide. (Br. Pat. 160,172; not yet accepted; L'AIR LIQUIDE SOC. ANON. POUR L'ETUDE ET L'EXPLOITATION DES PROCÉDÉS GEORGES CLAUDE, Paris. May 11, 1921.)

Scouring and Leather Dressing Composition.—A composition to be mixed with water to scour leather, with soda solution to scour wool and with oils to dress leather is prepared by mixing a neutralized sulphonated oil such as sulphuricinate of soda or ammonia with an organic solvent, preferably non-flammable. Solvents specified are carbon tetrachloride, tetrachlorethane, trichlorethylene, tetrahydronaphthalene, benzene and naphtha. In an example, 40 parts sulphuricinate are mixed with 60 parts tetrachlorethane. For wool scouring, 1 part of the product is used with 10 of soda, and for dressing chrome leather 4 parts with 2 parts of neatsfoot oil and 2 parts of oil. (Br. Pat. 160,738; not yet accepted; A. T. HOUGH, Choisy-le-Roi, Seine, France. May 19, 1921.)

Purifying Blast-Furnace Gases.—The flammable dust contained in blast-furnace and like gases is oxidized by the admission of a small quantity of air to the gas before purification. The control of the air supply may be co-ordinated with the gas generation in order to prevent the formation of an explosive mixture by closing the air-inlet valve when the main gas valve or the blast valve or damper is closed or by mounting the air supply fan on the shaft of the gas exhauster. Indicating or registering means may be provided for the air supply. (Br. Pat. 160,758; not yet accepted; HALBERGERHÜTTE GES., Halbergerhütte, near Brebach, Germany. May 19, 1921.)

Firing of Ceramic Ware in Tunnel Ovens.—In the firing of ceramic ware in tunnel ovens the heating of the high-temperature zone is interrupted at intervals to allow the goods therein to cool down to a temperature at which they are sufficiently hard to allow the trucks to be moved forward without risk of damage. The gas connections to two adjacent tunnels may be so arranged that their high-temperature zones are fixed alternately. During the interruption in firing the temperature of the preliminary heating zone of the oven is maintained or increased by auxiliary burners. Cooling devices may be fitted in the cooling zone and the heat abstracted may be used for drying. (Br. Pat. 160,814; not yet accepted; ALLGEMEINE ELEKTRICITÄTS GES., Berlin. May 19, 1921.)

Phosphate Fertilizer.—Natural calcareous phosphates or analogous phosphates, such as bone phosphate, which contain tricalcium phosphate and carbonate of lime, are treated in a rotary furnace with a current of sulphur dioxide, air and steam, at a temperature not exceeding 1,000 deg. C., whereby a mixture of mono- and di-calcium phosphates with calcium sulphate is produced, which is suitable for use as a manure. The presence of a small amount of a chloride, such as calcium chloride, facilitates the reaction. (Br. Pat. 160,847; J. J. MOREL, Grenoble, France. May 19, 1921.)

Current Events

in the Chemical and Metallurgical Industries

Burgess Nominated for Tariff Commission

William Burgess, of Trenton, N. J., prominently associated with ceramic industries since 1879, has been nominated by President Harding to be a member of the United States Tariff Commission. Mr. Burgess is executive commissioner of the United States Potters' Association and prominent in the affairs of the American Ceramic Society. He formerly was a professor of chemistry at Princeton University. His business activities have been devoted largely to the importing and jobbing of china and pottery wares. He is widely known for his public-spirited efforts to be helpful to the entire pottery and other ceramic industries.

For many years he has made a special study of the tariff and has made numerous confidential trips abroad to make studies of the tariff situation for the Government. For a time he was United States consul in the great pottery-producing district of Stoke-on-Trent, England. During the war he was one of the department heads of the War Industries Board.

U. S. Industrial Waste Commission Proposed

A federal commission to study waste elimination in industry is proposed in a bill which has been introduced by Senator Calder. The bill is intended to continue and to amplify the survey made by the Federated American Engineering Societies at the instigation of Herbert Hoover, who at that time was president of the organization.

Senator Calder's bill provides that the commission is to be known as the United States Industrial Waste Commission. It is to be composed of seven commissioners "of eminent attainment," appointed by the President. The bill specifies that the Secretary of Commerce is to be the chairman.

The commission is directed by the bill to make a final report on or before Sept. 21, 1922. The report is to cover waste in "timber, power, transportation, oil, coal, essential minerals and other basic raw materials. The commission is specifically instructed to recommend improved methods and means of eliminating intermittent and seasonal production, and is to serve without salary.

There is reason to believe that the Committee on Commerce, to which the bill has been referred, will take prompt and favorable action on it. The attention of the committee has been called to the fact that needless waste in industry is levying a heavy toll on business and on the public. It is emphasized that no regulation is contemplated in this legislation and that there is not to be a suggestion of interference with private initiative.

It is believed that such a commission will be able to draw public attention to some of the basic causes of waste and to practical methods by which they may be checked.

Irregularity of employment is recognized as one of the matters to which the commission would have to give much attention. The Committee on Commerce, in considering the bill, has before it information to the effect that the shoe-maker is idle 35 per cent of his time, the clothing worker 31 per cent. In other industries conditions are even more unfavorable. Data before the committee show that labor, directly and indirectly, is responsible for 88 per cent of the total cost of building. This high labor cost is due, in part, to the fact that in normal years building labor is idle one-third of its time.

The Superpower Survey is cited as an effort to eliminate waste. In the Boston-Washington industrial area about 17,000,000 hp. is being produced. Of this only 10,000,000 hp. is actually productive. The remaining 7,000,000 hp. either is wasted or is used to transport the fuel for the

10,000,000 hp. actually effective. The Superpower Survey is expected to show that the gradual development of an interlocking system of electrical transmission between superpower plants, to which coal could be transported economically, and a gradual development of hydro-electric plants would result in saving most of this 7,000,000 hp. In addition, byproducts could be saved and the transportation system correspondingly relieved. This has been cited to the committee as one example of what may be accomplished along the line of waste elimination.

The committee has also been furnished with data showing that there is great waste resulting from lack of co-ordination of railways, waterways and coastwise shipping, which among other things would relieve the rail lines of much of their burden of low grade, unprofitable freight. Specific instances of waste in coal production, petroleum production, lumber manufacture and many other activities have been pointed out to the committee.

International Standards

The secretary of the American Engineering Standards Committee, Dr. P. G. Agnew, has attended a conference in London of the secretaries of the national standardizing bodies. The conference had for its object an interchange of experience and the furtherance of co-operation among the various national bodies in their work of industrial and engineering standardization.

It is interesting that, notwithstanding great differences in the details of procedure, the same general method of work is followed in the different countries—namely, technical decisions concerning any specific piece of work are in the hands of a working committee which is so constituted as to be broadly representative, from both the technical and the managerial points of view, of the particular branch of the national industry concerned.

Suggestions of the conference have to do with the interchange of publications, a reciprocal arrangement for making foreign standards available and the exchange of information as to the status of work in progress. It was the view of the conference that international co-operation in industrial standardization work should proceed along such informal lines, being based primarily upon the interchange of information on active subjects of mutual interest, rather than by any attempt at the present time to form a general international standardizing body.

Conference on Petroleum Specifications

The Technical Committee on Standardization of Petroleum Specifications plans an open meeting in the offices of the United States Bureau of Mines in Washington, Tuesday, July 12, at 10 a.m. Eastern Standard time, for the consideration of suggested modifications and additions to Bulletin 5, which contains the specifications under which governmental purchases of gasoline, kerosene, fuel and lubricating oils are made.

From the standpoint of the oil trade the most important change proposed is the addition of a corrosion test to the specifications for motor gasoline. Some of the gasoline recently purchased has been found to be corrosive, and a test has been proposed to insure against a repetition of the trouble.

A few new specifications to cover products not now listed in Bulletin 5 have been suggested. Other modifications have been proposed, looking to improvement in the manner of making some of the tests.

N. A. C. Smith, petroleum chemist of the Bureau of Mines, is chairman of the technical committee.

Manufacturing Chemists' Association Annual Meeting

At the annual meeting of the Manufacturing Chemists' Association, the following officers were elected:

President, Charles L. Reese; vice-presidents, H. H. S. Handy and C. Wilton Miller; treasurer, S. W. Wilder; secretary, John I. Tierney; executive committee, Henry Howard, chairman; Adolph G. Rosengarten, Lancaster Morgan, C. Wilbur Miller, D. W. Jayne, H. H. Dow, E. L. Pierce.

The executive committee report for the year ended June 15, 1921, was presented by Dr. Henry Howard. Activities during the year included: Recommendations for tariff revision; arguments against the Federal Trade Commission section of the Nolan patent bill; appointment of a committee to co-operate with Secretary Hoover in collecting statistics on the production of sulphuric acid, nitric acid, soda ash, caustic soda and methanol; investigations at the Bureau of Explosives on a standard package for acid carboys; a conference with the Consolidated Classification Committee in regard to a suggested reclassification of acid shipments.

British Columbia Notes

The B. C. Cement Co. has closed its plant at Tod Inlet, ten miles from Victoria. For some time the plant has been kept in operation by orders from the Orient. With the exception of three or four heads of departments, the plant has been run entirely by Chinese labor. The value of the output of the plant in 1919 was \$260,000. The company owns and operates another plant on Vancouver Island.

The Prince Rupert Paper & Pulp Co. has acquired the British Columbia holdings of the North Empire Timber Co. This is one of the biggest timber deals that has been made in the province for some time. The timber area that has been purchased is only a few miles from Prince Rupert, and it is said to contain a billion feet of timber, 90 per cent of which is spruce and hemlock. The North Empire company is controlled in Cedar Rapids and other cities in Iowa.

John Bull, president of the Reliance Paper & Trading Co., which undertook the management of the Whalen Paper & Pulp Co.'s three plants in British Columbia last year, has reported to the directors of the latter company that a saving of \$2,500,000 has been made during the past year in the operation of the company's plants. The percentage of No. 1 pulp produced has been increased from an output of 20 to an output of 85 per cent.

The Clayburn Co. has reopened its plant at Kilgard, B. C., where it will manufacture only sewer pipe. Fifty men have been taken on the payroll. The company's Clayburn plant is working at capacity, manufacturing ornamental, pressed, and fire bricks.

A NEW MINERAL

What is believed to be a new mineral, a borate of magnesium, isomorphous with chrysotile, has been found at Douglas Lake, near Merritt, B. C. The mineral occurs in small veins, from the thickness of a sheet of paper up to 5 in., crisscrossing through serpentine. It has been analyzed by H. V. Ellsworth at the laboratories of the Dominion Department of Mines, at Ottawa, and found to contain magnesia, 47.87 per cent; boric acid, 41.44 per cent; water, 10.69 per cent. A physical examination has been made by Eugene Poitevin, who has been unable to classify it as any known mineral, so provisionally it has been named *camsellite*, after Charles Camsell, Deputy Minister of Mines for Canada, in consideration of the excellent geological field work that he has done in British Columbia.

Robert A. A. Johnston, chief of the Division of Mineralogy of the Federal Department of Mines, speaking of the new mineral, said: "The new mineral is finely fibrous and distinguished only with difficulty from chrysotile, with which often it is intimately mixed. In addition to *camsellite*, chrysotile and dolomite are always associated with the mineral. The three minerals do not occur in any constant proportion, however—in fact, there are wide differences in this respect in the specimens that have been examined. It has not been found possible to separate *camsellite* in an ideally pure

state, but on the other hand it has been possible to separate both the dolomite and the chrysotile from the specimens, clearly showing that it is only a mechanical mixture of the three minerals."

Patent Office Bill Reported Out by Committee

The bill providing for an increase of force and salaries in the Patent Office has been reported out by the House Committee on Patents with the recommendation that it be passed at the earliest possible date. The bill as reported is substantially the same as the one which passed the House at the last session except that the section authorizing the Federal Trade Commission to administer patents for Government employees has been eliminated.

The bill increases the salaries of the principal examiners in the Patent Office from \$2,700 to \$3,900 per year. Assistant examiners are allowed increases ranging from \$150 to \$900 per year. It is generally recognized that the salary of the principal examiners is the most important feature of the entire bill. Representative Lampert of Wisconsin, chairman of the committee, expresses the opinion that the salary of the principal examiners should be much higher than the \$3,900 provided in the bill, but says the committee had agreed on that figure in the hope that it would not be questioned and the bill passed as an emergency measure. He calls attention to the fact that the American Patent Law Association after a referendum vote expressed the opinion that the principal examiners should receive \$5,000. The National Research Council placed the salary at \$4,200, but with the idea of naming a figure that would pass at a time when Congress is emphasizing the need of retrenchment. In the Lehlbach reclassification bill the salaries of these examiners are placed at \$5,040.

The bill also increases the commissioner's salary from \$5,000 to \$6,000; that of the first assistant commissioner from \$4,500 to \$5,500; second assistant commissioner from \$3,500 to \$5,000; chief clerk from \$3,000 to \$4,000; one solicitor from \$2,750 to \$5,000; five law examiners from \$2,750 to \$4,000; two examiners of interferences from \$2,700 to \$5,000. Five members of the board of examiners-in-chief who are appointed by the President and who under the statute must have both scientific and legal training, will be allowed an increase by this bill from \$3,500 to \$5,000.

The demoralized condition of the Patent Office may be understood when it is known that there are now 46,472 applications awaiting attention. The number of pending applications is increasing all the time. In a little over a year 110 examiners—one-fourth of the total examining force—have resigned. These men were experienced examiners, with from two to twenty years training. Their places have been taken by young men just out of college—the only ones apparently to whom the salaries appeal. The difficulty is, Mr. Lampert points out, that they have no patent experience, and cannot act in intricate technical cases as rapidly as can those who have spent years in the Patent Office working with those subjects.

Critical Tables of Constants

The Board for Scientific Control of the project planned by the National Research Council for publication of critical tables of physical and chemical constants is now fully organized with the following membership:

R. B. Moore, of the Bureau of Mines; C. E. K. Mees, Eastman Kodak Co., and John Johnston, Yale University. Physicists, C. E. Mendenhall, University of Wisconsin; G. K. Burgess, Bureau of Standards, and Saul Dushman, General Electric Co., Schenectady. Dr. Dushman has been appointed to succeed Dr. P. W. Bridgeman, who was previously elected to membership on the committee.

It is hoped that a preliminary effort can be made on the physical constants work in the very near future, as the sums of money already subscribed insure that some effort can be undertaken at an early date. However, the sums available do not altogether provide for the project and additional subscriptions will be sought as soon as business conditions seem to justify this.

Industrial Alcohol Legislation

After hearing representatives of the American Chemical Society and of the manufacturers of industrial alcohol, the Committee on Rules of the House of Representatives reversed its attitude on the Volstead amendment and declined to give the Judiciary Committee the rule upon which it has insisted. This unexpected obstacle to the Judiciary Committee's program made it necessary to report out a bill by Representative Campbell which covers the amendments in which the manufacturers of industrial alcohol are not interested and leaves unchanged the provisions of existing law with regard to industrial alcohol. As this is written, there is some uncertainty as to the possible effect of a committee amendment which was added to the Campbell bill. This is the provision for re-enacting the penal sections of former internal revenue legislation. Manufacturers and consumers of industrial alcohol are particularly anxious that the troublesome statute which permitted the assessment of the beverage tax on all alcohol which does not enter absolutely into manufacture be not re-enacted. Under that law, the Bureau of Internal Revenue formerly assessed the beverage tax on alcohol lost through leakage, through destruction in railroad wrecks, and on that stolen or which failed to enter into manufacture for many other reasons. A careful examination of the statute now is being made to determine just what this will re-enact.

Encouragement of Scientific Research

Encouragement of scientific research in the fields of chemistry, metallurgy and engineering as well as in other scientific lines is accomplished in America by many funds, medals, prizes, etc. The National Research Council has made an extended investigation of the means used during 1920 for this encouragement of science and research. The following items which deal specifically with chemistry are taken from the Council's bulletin No. 9, just issued. There are shown the medals and prizes, the grants for research work, the institutional funds, and the fellowships and scholarships. These form a very imposing list of items.

CHEMICAL MEDALS AND PRIZES

Awards of the Glass Container Association of America. Seven awards for theses submitted prior to June 10, 1921, to stimulate more general research along the lines of better preparation and packing of foods and beverages, and to increase our knowledge of changes induced by preparation or storage of such products. Established 1920. Annually available, \$50-\$150.

Gibbs Medal of the American Chemical Society, Chicago Section. For eminent work in and original contributions to pure or applied chemistry. Established 1911. Present fund, \$7,500.

Grasselli Medal of the Society of Chemical Industry. For thesis presented before the society and offering the most useful suggestions in applied chemistry.

Nichols Medal of the American Chemical Society, New York Section. For meritorious research in organic chemistry. Established 1902. Present fund \$1,700. Annually available, \$98.

Perkin Medal of the Society of Chemical Industry. For the most valuable work in applied chemistry. Established 1906.

Scott Medal Fund. Medal and premiums awarded from time to time for useful inventions that will advance chemical, medical or any other science, or promote the development of industry in any form. Established 1816. Original fund, about \$4,000. Present fund, about \$100,000. Annually available, \$4,000 or more.

GRANTS

Chittenden Fund of Yale University. For research in physiological chemistry. Established 1915. Original fund, \$4,000. Annually available, \$192.

Clark Fund of the Harriman Research Laboratory. Endowment Fund, for the promotion of research in medical and biological sciences. Established 1912. Annually available, \$25,000.

Gibbs Fund of the National Academy of Sciences. For research in chemistry. Established 1892. Original fund, \$2,600. Present fund, \$5,545. Annually available, \$308.

Research Fund of the American Medical Association, Council on Chemistry and Pharmacy. Fund of Committee

on Therapeutic Research, used in connection with chemical investigations conducted by accredited research workers. Annually available, \$2,000.

Research Fund of the National Cannery Association. Grants for chemical, bacteriological and technological research relating to the manufacture of canned goods, systematic study of food poisons as applied to canned foods but not limited to this phase and the study of botulism.

Warren Fund of the American Academy of Arts and Sciences. For research in chemistry. Established 1892. Original fund, \$6,000. Present fund, \$13,289. Annually available, \$1,254.

INSTITUTIONAL FUNDS

Anonymous Fund for Wolcott Gibbs Laboratory of Harvard University. For research in physical and inorganic chemistry in the Wolcott Gibbs Laboratory. Original fund, \$5,000. Present fund, \$5,055.48. Annually available, \$55.48.

Appropriation to Nutrition Laboratory of Carnegie Institution of Washington. Endowment, for the encouragement in the broadest and most liberal manner of investigation, research and discovery, and the application of knowledge to the benefit of mankind. Established 1902. Original fund, \$10,000,000. Present fund, \$22,120,000. Available for 1920, \$52,432.39.

Contract with Ordnance Division of War Department of Yale University. For experimental work on explosives. For 1920-21, \$10,000.

Dalton Fund of the Mass. Institute of Technology. For payment of fees for research in textile chemistry. Present fund, \$55,000. Annually available, \$250.

Division of Applied Chemistry Testing Work Fund of the University of Illinois. For research work in chemistry. Annually available, \$5,516.

Endowment Fund of the Harriman Research Laboratory. For the promotion of research in medical and biological sciences. Established 1912. Annually available, \$25,000.

Food Research Institute of Leland Stanford Junior University. For the intensive study of the problems of production, distribution and consumption of food. Established 1921. Present fund, \$700,000. (Provided by Carnegie Corporation for support of the Institute for ten years.)

McCurdy Research Fund of Case School of Applied Science. For the use of seniors in chemistry for research. Annually available, \$1,000.

Organic Chemistry Research Fund of Yale University. For research in this subject. Established 1918. Original fund, \$600.

Research Fund of American Institute of Drug Proving. For work on drugs. Original fund, \$3,250. Annually available, \$129.

Research Fund in Chemistry of the California Institute of Technology. For research in chemistry. Established 1915. Present fund, \$200,000. Annually available, \$10,000.

Richards Fund of Mass. Institute of Technology. For research in chemistry. Present fund, \$15,000. Annually available, \$600.

U. S. Interdepartmental Social Hygiene Fund of Northwestern University. For research in chemistry department for compounds of therapeutic value in the treatment of venereal diseases. Established 1920. Present fund, \$5,000, for 1920-21 only.

Warren Fund of Harvard University. For the promotion of chemical research or the advancement of chemical science. Established 1893. Original fund, \$4,500. Present fund, \$7,595. Annually available, \$387.

FELLOWSHIPS AND SCHOLARSHIPS

Barnard Fellowship of the University of Chicago. For research in chemistry. Established 1915. Present fund, \$3,000. Annually available, \$156.

Bloede Scholarship of the Chemists Club of New York. For research in industrial chemistry and engineering. Established 1916. Original fund, \$10,000. Present fund, \$10,000. Annually available, \$500.

Carr Fellowship of the University of Illinois. For research in chemistry. Established 1919. Original fund, \$10,000. Present fund, \$10,000.

Chemistry Fellowship of University of Utah. For research in chemistry. Annually available, \$2,800.

Class of 1883 University Fellowships of Princeton University. For research in the department of politics, physics, chemistry, biology or geology. Established 1910. Original fund, \$30,000. Annually available, \$600 to each of two fellowships.

Columbia Univ. Fellowship of the University of Washington. For research in mining, engineering, and chemistry. Established 1917. Annually available, \$250.

Emerson Scholarships of Harvard University. For research in zoology, geology, mineralogy and chemistry. Established 1903. Original fund, \$20,656. Present fund, \$37,761.17. Annually available, \$400 each.

Fellowships of the California Institute of Technology. Six teaching fellowships in chemistry, for teaching, study and research in chemistry. Established 1917 and 1919. Annually available, \$750 each; and three fellowships for physical and chemical research. Established 1916. Annually available, \$1,000 each.

Fellowships of the National Research Council. For research in physics and chemistry. Supported by the Rockefeller Foundation. Established 1920. Present fund, \$500,000. Annually available \$100,000.

Grafflin Scholarships of Johns Hopkins University. For research in industrial chemistry. Established 1915. Annually available, \$1,000.

Goldschmidt Fellowship of Columbia University. For research in chemistry. Established 1908. Present fund, \$16,350. Annually available, \$736.47 (1920-21).

Hart Fellowship of Lafayette College. For research work on problems connected with viscous and plastic flow. Restricted to students in chemistry holding bachelor's degree. Established 1910. Original fund, \$10,000. Annually available, \$500.

Harvard Fellowship in Chemistry of Princeton University. For research in chemistry. Established 1905. Original fund, \$10,000. Annually available, \$500.

Herter Research Fellowship of New York University. For research in chemical pathology, physiological chemistry or pharmacology. Established 1903. Original fund, \$6,000. Annually available, \$300.

Home Economics Research Fellowship in Nutrition of the University of Chicago. For research in nutrition or related fields. Established 1919. Annually available, \$600.

Hoskins Fellowship of the University of Chicago. For research in chemistry. Established 1919. Annually available, \$400.

Huff Memorial Research Fellowship of Bryn Mawr College. For research in either physics or chemistry. Established 1913. Annually available, \$1,200.

Hoffman Scholarship of the Chemists Club of New York. For research in industrial chemistry and engineering. Established 1916. Original fund, \$10,000. Present fund, \$10,000. Annually available, \$500.

Loewenthal Fellowship of the University of Chicago. For research in chemistry. Established 1900. Present fund, \$10,000. Annually available, \$400.

Loomis Fellowship of Yale University. For research in physics. Established 1902. Original fund, \$10,000. Annually available, \$465.

Moore Scholarship of the Mass. Institute of Technology. For study of organic chemistry in Europe. Awarded from time to time. Annually available when awarded, \$250.

Research Fellowship in Chemistry in Bryn Mawr College. Resident Research Fellowship, for research in chemistry. Established 1893. Annually available, \$530.

Shevlin Fellowship of the University of Minnesota. For research in agriculture, chemistry, medicine and one in any subject. Annually available, \$500 each.

Swift Fellowships of the University of Chicago. For research in chemistry. Established 1908. Present fund, \$17,809. Annually available, \$920.

Teaching Fellowship of Leland Stanford Junior University. For research in chemistry (2). Established 1917. Annually available, \$600 each.

Teaching Fellowship of the Calif. Institute of Technology. Six fellowships for teaching, study and research in chemistry. Established 1917 and 1919. Annually available, \$750 each.

Traveling Fellowship of the American Scandinavian Foundation. Traveling Fellowships (20) of \$1,000 each, five for travel and study in Denmark, ten in Sweden and five in Norway, for the purpose of drawing the American and Scandinavian peoples closer in bonds of intellectual kinship. Established 1911. Original fund, \$500,000. Present fund, \$565,082.48. Annually available, \$40,000. (Only one-half available for United States.)

Upjohn Co-operative Fellowship of Yale University. For research in organic chemistry. Established 1919. Annually available, \$700.

Wisconsin Gas Association Fellowship of Univ. of Wis-

consin. For research in chemical engineering. Annually available, \$500.

Woodward Fellowship of the University of Pennsylvania. For research in physiological chemistry.

Tests of Brazed Copper Sheets Intended for Roofing Purposes

Recently the Library of Congress submitted to the Bureau of Standards for test some copper sheets for roofing purposes which had been joined by brazing. Two types of joints were used, a simple "lap" joint and a "lock" joint in which the edges of the two sheets to be joined were first bent double and then "locked" into each other.

The series of examinations indicated that of the two types of joints designated as lap and lock, the lap joint is superior in strength and much more desirable in its structure. In forming the lock joint apparently it is necessary to apply the heating torch for a considerably longer period in order to cause the metal to flow into the joint. In doing this the upper fold of the sheet which forms the lock is highly heated and often burned. It was noticed in most cases that none of the brazing metal penetrated directly below the upper fold, so that the upper sheet could easily be bent along the line of the junction. It appears from the results of this examination that if the buckling of the sheets, which apparently cannot be entirely prevented with this method of joining sheets, is not too objectionable, the lap joint should be satisfactory for the purpose. The lock joint is decidedly inferior in strength and other properties to the lap joint.

It may be pointed out that the joints should be carefully cleaned after brazing. In the specimens submitted, the film of zinc chloride remaining after cleaning the specimens was sufficient to accelerate atmospheric corrosion very decidedly within a very short time.

\$250,000 Appropriated for Helium Studies

The army appropriation bill, as finally approved by the conferees on the part of the Senate and the House, carries \$250,000 for "experimentation, conservation and production of helium." This is a very material cut from the \$800,000 requested by the War Department.

The bill gives authority "to explore for, procure or reserve helium gas" and also provides for "the purchase, manufacture, construction, maintenance and operation of plants for the production of helium and experimentation therewith."

Book Reviews

METALLOGRAPHY, Part II, The Metals and Common Alloys. By S. L. Hoyt. New York: McGraw-Hill Book Co., Inc., 1921. Price, \$5. 462 pages, illustrated.

This is a continuation of the author's text and reference book on Metallography and "describes the more important metals and alloys," including chapters on Pure Metals, White Metal Alloys, Light Metal Alloys, Brasses and Bronzes, Steel and Cast Iron and Special Steels.

We have had in the past reference books dealing with the properties of alloys without much reference to their structure and constitution as well as those dealing with the structural, thermodynamic equilibrium of alloys with but little description of their properties. This is, as far as the reviewer knows, the first one that deals adequately with both phases of this subject, so intimately related, and discusses theoretical as well as practical aspects of metals and alloys. As a typical example of the mode of treatment, the chapter on light aluminum alloys discusses the structure of light alloys with the usual diagrams and typical photomicrographs, interprets by their aid the effect of different alloying elements and impurities on the properties of the alloys, and describes the useful properties of commercial alloys, giving tables of their numerical magnitude.

The material is, in general, quite up to date. The large

number of references proves a very thorough bibliographic mastery of the subject on the author's part and is of the greatest value to the reader.

It is to be hoped that in a second edition those paragraphs in description of commercial alloys available in this country will be much expanded, particularly with respect to the brasses and bronzes. Perhaps manganese bronze should be treated under the caption of brasses instead of that of bronzes if correct nomenclature is to be followed. It is possibly a personal prejudice that leads the reviewer to regret the absence of any discussion of several important alloys of nickel, such as nickel-silver, copper-nickel, nickel-chromium, and Monel metal.

The chapters on iron, steel and alloy steel are quite full; in particular there are very good paragraphs on the inclusions in steel. Adequate tables are given of the mechanical properties of the alloy, or automobile steels; it is believed, however, that these chapters would be improved by the addition of some representative photomicrographs of commercially heat-treated nickel and chromium-nickel steels of good quality. Text-books evince a disposition to reproduce structures of pathologic specimens of heat-treated steel only, which may perhaps be somewhat misleading to the student without practical experience.

In brief, this volume appears to invite frequent consultation both by experienced and inexperienced in this field and to excite the hope that the third part of this series, on Technical Practice, will soon appear.

PAUL D. MERICA.

THE RECOVERY OF NITRATE FROM CHILEAN CALICHE. By Arthur W. Allen. 50 pages. London: Charles Griffin & Co.

Many engineers and chemists have spent years in the caliche fields of Chile and have come away without more than a descriptive outline of the processes used in the nitrate industry. Mr. Allen proves to be an exception, has had ideas on how its technology can be improved and has incorporated them into a little text that should prove to be an accelerator in speeding up the adoption of better methods. He describes the Shanks process both in the extraction and crystallization stages as now practiced. He then takes up the question whether an alternative scheme is desirable. In conclusion he lays out his own plan using upward percolation and thus reducing the frictional resistance of the slimy borra earths. Improvements in evaporation and the use of the salt grainer are amply discussed. As no adequate laboratory facilities and services were available, the chemistry of the solution of mixed salts was not taken up in the author's investigation.

WALLACE SAVAGE.

THE MICROSCOPE: ITS DESIGN, CONSTRUCTION AND APPLICATIONS. A symposium and general discussion published in the *Transactions* of the Faraday Society, London. 260 pp. 1920. Price 15s.

The recent and rapid development of microscopes and the great interest shown in microscopic methods of research and testing are reflected in this series of articles covering the following subjects:

Introductory Address by Sir Robert Hadfield; General Papers on the Mechanical Design of Microscopes and the History and Design of Photomicrographic Apparatus; The Optics of the Microscope, Including Notes on the Resolving Power of the Microscope; The Manufacture of the Microscope; Aspects of Microscope Design and Construction; Optical Glass; Applications of the Microscope, Including Applications in Metallography, Metallurgy and Engineering and Applications to Metrology; Testing of the Microscope; Notes on Light Filters; Description of the Davon Micro-Telescope and Super-Microscope.

Sir Robert Hadfield, always an interesting writer, presents a fascinating history of the microscope from ancient times to the present which includes photographs of Dr. Sorby, Dr. Dallinger, Dr. Zacharias Jansen, Hans Lipperhey and Leeuwenhoek, a reproduction of the front page of Robert Hooke's *Micrographia* published in 1665 and a complete bibliography of the chief literature relating to micrograph from 1665 to 1919 inclusive.

A description of these *Transactions* in detail would re-

quire a volume in itself; therefore I must content myself with a few remarks on that portion of the book most interesting to chemists and metallurgists.

Sir Robert Hadfield contributes some unusual notes on the "Great Work of Sorby" and publishes some of Sorby's early photomicrographs of hammered bloom and blister steel, magnified nine diameters. By way of contrast he also shows some photomicrographs of pearlite magnified from 5,000 to 8,000 diameters. In this connection the writer would like to remark that apparently nothing is gained by an increase above 1,500 diameters, the effect at the extremely high magnification being the same as that produced on a lantern screen by enlargement of a negative taken at 1,500 diameters. In fact in one case an enlargement to approximately 5,000 diameters from a photograph taken at 1,500 diameters of pearlite and graphite in cast iron looks fully as clear if not slightly clearer than a photomicrograph taken from the identical spot and magnified 5,000 diameters. Some of these high-powered photomicrographs, however, are reproduced in plates 5¼ x 7½ in. and produce a rather striking effect.

The well-known names of LeChatelier, Sauveur, Benedicks, Rosenhain, Desch, Giolitti and E. F. Law are found in connection with brief articles on Improvements in Metallurgical Microscopes.

Benedicks comes to the following conclusions after a detailed and critical examination of the new Reichert microscope (of the LeChatelier type):

- (1) An arc lamp (350 c.p.) or an incandescent lamp (50 c.p.) gave exactly the same result.
- (2) A modification of the microscope is proposed to diminish sensitivity to vibration.
- (3) The proper arrangement of the diaphragms is discussed.
- (4) A LeChatelier prism and a 45 deg. prism give at high magnification exactly the same result.
- (5) A metal mirror gives slightly better contrasts than a prism.
- (6) In the plain glass illuminator a thickness of 0.45 mm. does not injure sensibly the image quality.
- (7) A slightly platinized glass illuminator gave somewhat finer details than any other illuminator used; this question, however, needs further research.

Dr. Zay Jeffries contributes some notes on the measurement of grain size.

Some references are found to the new Pointolite lamp, which consists of a small tungsten arc, and would seem to give promise of good results in photomicrography. It would add to the value of this book if a more complete description of this lamp had been included.¹

The book is commended as a very valuable reference book for its detailed information to all metallurgists using the microscope as a method of testing and research and to all other users of the microscope. It serves as an excellent review of the history of this instrument and its recent developments, and should be in the hands of every one interested in science, whether pure or applied.

H. M. BOYLSTON.

Personal

CHARLES COPELAND, assistant treasurer of E. I. du Pont de Nemours & Co., has been elected a member of the board of directors and secretary of the company to fill the vacancies caused by the death of Alexis I. du Pont. Mr. Copeland has been assistant treasurer of the company for eighteen years.

Mme. CURIE and IRVING LANGMUIR received honorary degrees of Doctor of Science at Northwestern University, Evanston, Ill., June 15.

OTTO EISENSCHIML, president of the Scientific Oil Compounding Co. of Chicago, sailed the latter part of June for

¹"A New Microscope Illumination," see CHEM. & MET. ENG., vol. 20, p. 281 (Feb. 11, 1920).

a trip through Europe. Among other points he will visit will be Vienna, Austria.

ISMAR GINSBERG announces the opening of an office in the Chemists' Club Building, with all facilities for undertaking investigations into the literature, patent searches and regular service on selected topics. He will also compile bibliographies and furnish translations from all foreign languages.

THOMAS F. RILEY, manager of the Imperial Porcelain Works, Trenton, N. J., has been appointed by Gov. Edwards a member of the board of directors of the Trenton School of Industrial Arts, to succeed the late Karl G. Roebling.

Prof. ROBERT F. RUTTAN, of McGill University, Montreal, Canada, has been nominated president of the Society of Chemical Industry for next year, succeeding Sir William Pope.

MAX Y. SEATON, who was chemical engineer with the Dow Chemical Co., Midland, Mich., particularly in charge of the oxygen chloride research division, is now technical director of the National Kellastone Co. of Chicago. He is also in charge of technical work for the Sierra Magnesite Corporation of Porterville, Cal.

WILLIAM O. THOMPSON has resigned as chairman of the board of directors, American Cotton Oil Co., New York, effective July 1.

FRED A. WHITAKER, superintendent of the Keasbey, N. J., plant of the General Ceramics Co., New York, will sail for Europe at an early date for a two months' pleasure trip abroad with Mrs. Whitaker. England, Germany and other countries will be visited.

GERALD L. WENDT has been promoted from assistant to associate professor at the University of Chicago.

Current Market Reports

The Chemical and Allied Industrial Markets

NEW YORK, June 27, 1921.

Irregular periods of inquiry, followed by intervals of dullness, featured the chemical market during the past week. The inquiries involved both domestic and export requirements, but buyers' and sellers' views differed on export account sufficiently in most instances to restrict any actual transactions. Italy, South America and Canada seemed to be foremost on the list of foreign buyers. Domestic consumers did not depart appreciably from their conservative attitude and showed a preference for only small lots. The market in general is behaving well under serious declines in outside commodities and securities and in the face of a cross-current of trade reports emanating from various sources. A peculiarity is that all recent advances were well sustained and there were several instances where an actual shortage of spot supplies existed.

Among the large items caustic soda and soda ash are still showing the most strength in the open market. Both chemicals have continued in scant supply on the spot and small-lot buyers often had the price advanced by sellers. This continued small-lot buying has seemed to have its effect on supplies. Producers received most of the call for carlots and it is understood that a fair volume of business was placed at the works. Italy has sent numerous inquiries for soda ash at prices a trifle below the domestic market. It was stated among leading soda ash manufacturers that foreign producers nearer Italy are naming figures which prevent any active competition on the part of American producers. Regarding the surplus supplies of caustic soda in South America, it is stated that stocks are steadily decreasing and that business in caustic will probably show some real improvement in the very near future. Nitrite of soda showed a stronger tone late in the week under an improved inquiry and a tightening of holdings. This chemical requires a license to import and should naturally recover very easily on any display of buying power. Bichromate of soda ruled fairly steady on the spot market. The

call for small lots was quite active and this with relatively low supplies in second hands had a strengthening market influence. Bleaching powder sold fairly freely at the works. Large dealers are competing for prospective business and considerable trading went through at prices ranging from \$2.10@ \$2.20 per 100 lb. at the works. Salt cake showed signs of becoming more active, and it looked as though some buyers both home and abroad were feeling out the market prior to replenishing their stocks. Camphor advanced sharply under an improved demand and strong foreign cables.

MARKET DEPENDS ON FOREIGN POLICIES

While confidence is increasing, the immediate outlook is uncertain regarding business. There are enough conflicting influences at present to create a cautious feeling among buyers and little material improvement can be expected until our foreign policies are more clearly defined and the tariff tangle is straightened out. The following is a report recently made public by the American Section of the International Chamber:

"The United States is one of the chief sufferers from the partial dislocation of the trade of the world and unless she is prepared to extend credits on a large scale she must look forward to a great decrease of her export trade which will react unfavorably upon industrial conditions and retard her recovery from the present depression. The problem of the readjustment of foreign trade relations is one of the most important developments that has resulted from the world war and upon her success in solving it the commercial prosperity of the United States during the next few years will in no small degree depend."

Labor conditions are improving and the possibility of lower freight rates seems nearer. Exchange has shown a disposition to recover and money rates have worked to a lower loaning basis. These are at least favorable factors, but a revival of export trade is what the chemical market wants.

CHEMICALS

New arrivals of German *caustic potash* are having a disposition to check any advancing tendency which this chemical might display. The general quotation for this material is 5¼@5½c. per lb. for the 88-92 per cent. Sales, however, have gone through below the inside figure and the market in some quarters is irregular owing to the keen state of competition existing. Yellow *prussiate of potash* is moving quietly on the basis of 24½c. per lb. ex-store. Sellers quote 24½@26c. per lb. The red variety is quiet, with small lots obtainable at 35c. per lb. It is very probable that on a firm offer this figure could be shaded. Sellers of *citric acid* generally quote 46@47c. per lb. for spot material, but odd lots are obtainable below these prices and in one quarter 45c. is heard. The quiet extent of the inquiry at present has left the market somewhat irregular, although supplies do not seem to be heavy and it looks as though the market is in a position to respond to any real improvement in demand. Odd lots of imported *oxalic acid* are offered on the spot at 18c. per lb. Most sellers are maintaining prices at 19c. and upward, depending upon the brand and quantity.

Small-lot trading continues to feature the market. Resale *bichromate of soda*, standard make, was somewhat irregular during the latter part of the week, with dealers quoting 8@8½c. per lb. on spot, and rumors of odd-lot sales a shade under the inside figure. Demand was not active and scarcely enough business passed to really test values. Offerings were not heavy and some interests express the opinion that relatively little stock could be purchased around prevailing quotations. No important change in spot prices for resale lots of standard brands of solid *caustic soda* could be noted. Prominent dealers stated that \$4.10 per 100 lb. could be done, on limited quantities, while most sellers quoted the market at \$4.15@ \$4.25 ex-store according to size of order. The contract price is steady at 3¼c. per lb., basis 60 per cent, f.o.b. works. Domestic *cyanide of soda* is quoted at 29c. per lb. asked, while the French and German grades are quoted at 19½ and 20c. per lb. respectively. The market is irregular with competition keen for new business. It is possible that domestic producers will shade

the above price when there is sufficient business to warrant it. Spot *nitrite of soda* was quoted at 7½@8c. per lb. by dealers with trading rather quiet. Some odd lots could probably be purchased at concessions, but the bulk of supplies appears to be well held at present. Small-lot inquiries are reaching the market occasionally, but there is no permanent buying movement in progress at the moment. The inquiry for light *soda ash* is holding up now and prominent dealers state that sales of single bags are going through at \$2.15@\$2.20 per 100 lb. ex-store and that a good movement of small lots in barrels is in progress at \$2.60@\$2.70 per 100 lb. Dealers quote at the works \$1.60 per 100 lb., basis 48 per cent, in single bags and \$1.95, basis 48 per cent, in barrels. Leading producers reported a fairly good call for *bleaching powder* at the works and stated that sales went through in moderate volume at \$2.10@\$2.20 per 100 lb. in large drums and up to 2½c. per lb. in small drum containers. Moderate trading on spot was reported at 2¼@2½c. per lb. Trading in the technical variety of *epsom salts* was reported at \$1.20 per 100 lb., while considerable business in the U.S.P. grade went through at 2¾c. per lb. The above prices were named by prominent sellers at the close.

COAL-TAR PRODUCTS

The tone of the coal-tar products market during the past week has been steady, but there has been no tendency shown to operate on other than a routine small-lot basis. A wider range of trading is developing and some of the more stagnant materials are beginning to move into consuming channels. While the summer period will be attended with the usual quiet trading, the outlook is healthy and no setbacks are expected. Prices are holding well and few distressed lots are glaring among the offerings. *Benzene* is in heavy demand and with production curtailed the available supply is said to be shy and prices are firm. *Cresylic acid* is in easy supply and prices depend on seller. *Naphthalene* is in very light demand and while resale lots range around 7@7½c. per lb. producers seem to be holding at the former level of 8½@9½c. for the prime white flakes. Quite a number of foreign inquiries have reached the market for *phenol*, but no sales have resulted as yet. Orders for intermediates in small quantities have been fairly well distributed and a few inquiries for round lots are reported. There seems to be a scarcity of *para-nitrophenol*, and orders for spot goods are not available. The market for *beta-naphthol* is reported firm at 38@42c. per lb. Supplies of *aniline oil* are reported easy at 20@26c. per lb. *Dimethylaniline* is steady at 40@50c. per lb., depending on quantity and seller. The inquiry for *benzoate of soda* is showing seasonable improvement and in some directions a decidedly better run in business was reported. It is stated that a fair volume of sales has been made for shipment to canneries on the Pacific Coast, and it is expected that demand from the East will increase with the advance of the season. Prices range from 55@60c. per lb., according to quantity and seller. The market is quoted firm at the inside figure. The output of *para-dichlorobenzene* is confined to few makers and at the moment available supplies are scarce. The consuming demand, however, is not very active and prices are quotably unchanged at 15@25c. per lb., depending on quantity. The demand for supplies of *para-phenylenediamine* has fallen away lately, but the tone is steady and prices range from \$1.75@\$2 per lb. The consuming demand for *nitro-benzene* still holds to a dull routine nature for small quantities, while supplies are easy and quoted at 12@15c. per lb. The demand for supplies of *meta-phenylenediamine* continued in fair volume during the period and sales were on the basis of \$1.15@\$1.20 per lb.

The St. Louis Market

ST. LOUIS, Mo., June 24, 1921.

The fine chemical market continued to expand the last week, with inquiries more frequent and for larger quantities. In spite of the slumping off in demand the past two weeks for heavy chemicals in general, prices for the most part remain unchanged. This would indicate that the second-hand's stocks are about depleted and that the present quotations are again based upon the actual manufacturers' cost.

The drug market underwent little change during the last week and the present prices quoted could be safely taken as a level at which buyers could operate and feel assured that no further reductions would take place.

ALKALIS

Caustic soda continues to move in small lots even to the formerly large buyers, with no contracting being done. Price, the same. *Soda ash* is still quoted at \$2.90@\$3 per 100 lb., basis 58 per cent, with demand slightly under routine. *Sal soda* is in routine demand, price \$1.90@\$2.50 per 100 lb. according to the quantity ordered. *Bicarbonate of soda* is inactive.

INDUSTRIAL CHEMICALS

There has been a heavy demand for *ammonia water*, 26 deg., with the market firm. *Carbon bisulphide* has shown some improvement since our last report. A heavy demand for *iron sulphate crystals* has been evident lately. The outdoors season is showing very good effects on the *hypo-sulphite of soda* demand, which continues to increase. *Sulphur* holds very firm at 2½c. for the commercial in bags, with a good demand.

DRUGS AND PHARMACEUTICALS

Citrates continue to command a fair volume of business. An excellent demand for both *soda* and *potassium bromide* has been experienced since our last report, with the market firm in spite of the heavy importations. *Cream of tartar* continues in a fair way. *Glycerine* again declined and is now quoted at 16c. per lb. for both spot and contract. Shading to 15½c. per lb. on *glycerine* is not uncommon. The majority of contracts for the next six months have been signed. A very brisk demand for *hydrogen peroxide* is now coming from all sources and some fair sized business has passed in the last ten days. An improved demand for *iodides* has been experienced since our last report, especially the *potash salt*, which undoubtedly is due to the resale stocks having been practically absorbed. *Mercurials* have shown a lack of interest in spite of the reduction made a couple of weeks ago. *Salicylates* continue to enjoy a fair demand and business in a routine way is being done.

ACIDS

There has been no change in the conditions of *carbolic acid crystals* since the last report. The demand for *citric acid* fails to show any improvement and new features of interest are still lacking. Apparently beverage manufacturers continue to pursue their conservative policy in buying. The revival of activity in aniline dye manufacture has led to an improvement in the demand for *gallic acid* and a very nice business is now being transacted in this commodity. Factors report that the demand for *hydrochloric*, *nitric* and *sulphuric acid*, commercial grades, is remarkably good despite the increase in price recently made by the manufacturers. *Phosphoric acid sirupy* fails to show any improvement. A heavy demand for *acid pyrogallie* both *resublimed* and *crystals* is coming from the photographic trade.

VEGETABLE OILS

Linseed oil reached a peak of 82c., basis raw in cooperage, from warehouse, and today holds at 79c. per gal. for spot and forward to Aug. 1, though practically no contracting is being done. *Castor oil* continues to hold at 10½c. per lb. in drums, with fair demand. The *turpentine* demand is under routine with price uniform at 65c. in 5-bbl. lots.

The Iron and Steel Market

PITTSBURGH, June 24, 1921.

From an already light demand for steel products there has been a further decrease, one that can hardly be explained on the ground of further decrease in consumption, and is probably attributable to manufacturing consumers making a still more strenuous effort to dispose of such stocks as they have had on hand. Manufacturing consumers who normally carry thousands of tons of rolled steel are now unwilling to carry hundreds of tons and if they cannot use the steel themselves they sell it for what it will bring. The most drastic liquidation in the history of the steel industry in stocks of steel is in progress, and is now nearly completed. The liquidation would be easier were

not manufacturing consumption so light. The direct bar to manufacturing activity is large stocks of manufactured goods, agricultural implements, machinery, hardware, cutlery, tools and the like. These manufactured goods will be liquidated in time, but the process is slow.

NO "CONSUMPTION" OF STEEL

Meanwhile the country's general activity has not slowed down by anything like the percentages that are shown by steel production. The freight ton mileage on the railroads in March was 63 per cent of the rate in the record month in all history—August, 1920—while it was approximately equal to the average rate in the best year before the war. The trade now has to make a distinction between the "consumption" of steel and the "use" of steel. Before the war it was held, and the point was supported by all experience, that the production of steel could not go below about 50 per cent of capacity, because the country always had to have a considerable quantity of steel even in bad times. The country is employing or using steel fairly well even at the present time, but it is not putting much more into use—it is not "consuming" steel in that sense.

STEEL PRODUCTION

The production of steel is now at about 22 or 23 per cent of capacity, against an average rate of 80 per cent in the first nine months of last year, and the rate may get down to 15 per cent or even 10 per cent in July. As liquidation in stocks of steel and, still more important, in stocks of wares made from steel, progresses there will be increased demand upon the steel mills, probably in August, quite certainly in September. If July shows a 15 per cent production of steel and September a 30 per cent production there will be a 100 per cent gain, and the steel industry will still be operating at a rate inconceivably low from the viewpoint of all times before the war. The demand is going to increase slowly, beginning in August or September. At no time in the discernible future will there be a rush for steel, since the mills have shown wonderful ability to fill orders within a very few days of their receipt and occasion will not arise in the near future for anyone to build up stocks of steel or of goods made from steel.

STEEL PRICES

Steel prices are sagging, yielding on the slightest provocation of inquiry that is at all tempting. Three weeks ago the Steel Corporation reduced prices on wire products \$5 a ton, following selling by independents for some time at cut prices. A week ago today the Republic Iron & Steel Co. reduced its prices on sheets \$5 a ton, on account of cutting by several other interests, three other sellers immediately following Republic, while last Tuesday the Steel Corporation met the reduction. The reductions are from the so-called "April prices." Bars are being shaded at least \$2 a ton and plates and shapes \$4, but no formal reductions in these lines have thus far been announced. Prices made just now are not regarded as a criterion for the future, when, with enough buying to make a real market, prices are going to be made that will yield with great difficulty if at all. A sound schedule of prices cannot be developed now, as there is not sufficient business going to make such a market.

PIG IRON AND COKE

Pig iron prices are off about 50c. in the week, the market being now quotable at \$22.50 for bessemer, \$20.50 for basic and \$21.50 for foundry, f.o.b. valley furnaces, with \$1.96 freight to Pittsburgh.

Connellsville furnace coke has eased off and has sold at \$3 per net ton at ovens, with extremely light demand.

A few sales of Lake Superior ore have established prices for the 1921 season, at \$1 reduction from the 1920 schedule, thus restoring the 1919 prices, Mesabi non-bessemer being \$5.55 per gross ton at Lake Erie dock. The reduction corresponds with the amount many furnace companies wrote off their ore inventories at the close of last year. The pig iron market some time ago reflected the decline in ore. The pig iron market is made by sales from furnace stocks, there being scarcely any production of furnace iron, and prices are in relation to prospective replacement cost, not the cost of the iron that is being sold.

Industrial

Financial, Construction and Manufacturers' News

certain equipment have been awarded. William A. Taylor is president. A. B. Patterson, Tulsa, Okla., is engineer.

TULSA—Cassien & Co., operating a local oil refinery, will make improvements and extensions at their power house to cost about \$100,000, including boilers and other equipment.

Construction and Operation

Arkansas

HELENA—S. A. and B. L. Lane, Little Rock, Ark., are negotiating with the Chamber of Commerce, Helena, for a suitable site for the erection of a new local oil refinery. The initial unit is estimated to cost about \$35,000.

Connecticut

NORWALK—Charles H. Harris, Inc., has been incorporated under Connecticut laws with capital of \$500,000, to manufacture glassware products. The company has recently awarded a contract for the erection of a new 1-story plant on Main Street, 100 x 200 ft., estimated to cost about \$75,000. It will be affiliated, it is understood, with the company of the same name, with offices at 135 W. 24th St., New York. Charles H. Harris, Penn Ave., Norwalk, is president.

Delaware

WILMINGTON—The Darco Corp., a subsidiary of the Atlas Powder Co., du Pont Bldg., has arranged for a bond issue of \$1,500,000, the proceeds to be used for the erection of a new plant in Louisiana for the manufacture of refined carbon products, known as "Darco," used in connection with the production of sugar, gelatine, etc. The plant will have an initial daily capacity of close to 5,000 tons.

Florida

ST. PETERSBURG—The Shinem Mfg. Co., manufacturer of polishes, has plans under way for the erection of a new 2-story plant, 40 x 100 ft., for the manufacture of its regular specialties. George W. Wrennick is general manager.

Georgia

ATLANTA—The Cotton State Rubber Mfg. Co., recently organized, is planning for the establishment of a new plant for the manufacture of rubber goods, including belting, packing and other mechanical specialties. George J. Reiter is president, and W. S. McKemia secretary.

Illinois

OREGON—The Paragon Foundries Co., manufacturer of plates and other iron castings, has plans under way for the erection of a new 1-story addition, 100 x 200 ft., to cost about \$50,000. N. E. Buser, Mount Morris, Ill., is architect; James Reed is president.

Kentucky

LOUISVILLE—The Southern Iron & Steel Co., recently organized, will operate a local plant for the manufacture of bar iron, squares, rounds, etc. It is planned to develop a daily output of about 75 tons. E. M. Drummond is president, and James A. Drummond secretary and treasurer.

Maryland

BALTIMORE—The American Sugar Refining Co. is continuing to file plans for the erection of buildings at its new local refinery at Woodall and Clement Sts., and the latest permit issued provides for the construction of a 7-story pan house, 80 x 154 ft.

Massachusetts

EAST LONGMEADOW—The New England Steel Castings Co., Shaker Rd., is reported to be planning for the rebuilding of its plant, destroyed by fire, June 15, with loss estimated at close to \$100,000, including equipment.

FALL RIVER—The New England Refining Co., Peat St., has filed plans for the erection of a new oil separator building to cost about \$50,000, and new gas holder to

cost about \$36,000. Construction will begin at once.

Minnesota

HIBBING—The Mahoning Iron & Steel Co. has completed plans for the immediate erection of a new laboratory building at its local properties, known as the Mahoning Mine.

New Jersey

PERTH AMBOY—One of the buildings at the plant of the American Agricultural Chemical Co., Roosevelt district, was recently destroyed by fire, with loss estimated at about \$15,000.

TRENTON—The Miller-Steiner Rubber Co., recently incorporated with a capital of \$100,000, has taken over the plant of the Olden Rubber Co., 678-94 North Olden Ave., and will establish a plant for the manufacture of mechanical rubber goods. Alterations will be made and machinery installed at once. It is proposed to commence operations early in July. John M. Miller is president and general manager.

NEWARK—The Wilson Imperial Co., Hermon St., manufacturer of polishes, paint and varnish removers, etc., has acquired property adjoining its plant, heretofore held by the Storms Co., manufacturer of dumb-waiters, etc. The property is 90 x 165 ft., improved with a 2-story building, totaling about 15,000 sq. ft. of manufacturing space. It will be used, in part, by the new owner for expansion.

NEWARK—The Irvington Smelting & Refining Works, Nye Ave., has commenced the installation of a new precipitator for the prevention of acid fumes at its plant.

New York

BEACON—The Beacon Tire & Rubber Co. has awarded a contract to Amos Jones, 45 North St., for the erection of a 3-story addition to its plant, 50 x 80 ft., estimated to cost about \$25,000.

ITHACA—The Superintendent of Buildings and Grounds, Cornell University, has taken bids for the erection of the proposed new 4-story chemical laboratory at the institution, 192 x 268 ft., estimated to cost close to \$2,000,000. Gibb & Waltz, 110 North Tioga St., are architects.

North Carolina

ASHEVILLE—James E. Rector, head of Rector, Blackstock & Taylor, 8 Technical Bldg., is planning for the installation of new equipment at his local brick manufacturing plant, comprising the former works of the Asheville Shale Brick Co., recently acquired under lease. New drying machinery and burning apparatus will be provided. It is proposed to develop an output of about 25,000 bricks per day.

Ohio

CAREY—The Hume China Co. will take bids early in July for the erection of its proposed new 1-story pottery, 150 x 500 ft., to be equipped for the manufacture of general ware. W. W. Matchett, 408 Alliance Bank Bldg., Alliance, O., is architect. George H. Hume is president.

NILES—F. A. Sebring, Sebring, O., operating a local pottery for the manufacture of general ware, has acquired the interests of W. H. Tritt in the Tritt China Co., Niles.

Oklahoma

ONETA—The Oneta Refining Co. is perfecting plans for the erection of its proposed new oil refinery at Pine Bluff, Ark., to have an initial daily capacity of about 1,000 bbl. The new plant with machinery is estimated to cost close to \$300,000. H. C. Mier, vice-president, is in charge.

PRESTON—The Taylor Oil & Gasoline Co., 265 Post Office Bldg., Okmulgee, Okla., recently organized with a capital of \$500,000, has perfected plans for the erection of a new two-unit gasoline plant at Preston. It is proposed to develop a daily output of about 2,500 gal. The plant is estimated to cost in excess of \$150,000. Contracts for

Pennsylvania

PARKERS LANDING—The Wightman Bottle & Glass Co. has resumed operations at two more shops at its local plant for increased production. A number of repairs and improvements have been made in the buildings during a shut-down for over a month past. The plant will operate on two 8-hour shifts.

BEDFORD—Property of the Philadelphia Vitriified Brick Co., in Bedford Co., near Bedford, will be offered at public sale on July 11, by J. M. Fink, trustee. The plant consists of a complete works for the manufacture of vitriified brick, with adjoining property totaling over thirty-five acres.

PHILADELPHIA—The Mutual Rendering Co. has taken title to the plant of the Haffleigh Rendering Co., Ontario and Brabant Sts., devoted to the manufacture of tallow and affiliated products, and will operate the plant at this location. A consideration of about \$90,000 was given for the property.

South Carolina

GAFFNEY—The McCraw Brick Co. is planning for the installation of new machinery at its plant, to include a department for the manufacture of pressed bricks. A new steam shovel is also being considered, for installation at the clay properties. C. D. Meadows is secretary and treasurer.

Virginia

RICHMOND—The R. A. Cauthorne Paper Co., Inc., Tenth and Carey Sts., has tentative plans under way for the erection of a new local paper manufacturing plant, on site at Hull and Brander Sts., estimated to cost about \$75,000. Carneal & Johnson, Chamber of Commerce Bldg., are architects.

BOYDTON—Baptist & Goode are considering the erection of a new plant on local site for the manufacture of bricks and other burned clay products.

Tennessee

MT. PLEASANT—The Phosphates Products Co., recently incorporated with a capital of \$25,000, will operate a local fertilizer manufacturing plant. E. E. Fisher and N. B. Stewart, Mt. Pleasant, head the company.

KINGSFORD—Under a decree issued by the Chancery Court, the local plant of the Union Dye & Chemical Co. will be offered at public sale on Aug. 10. The plant is now in the possession of the Equitable Trust Co., New York, trustee. It is estimated in value in excess of \$2,500,000.

Texas

SHERMAN—The Buffalo Producing & Refining Co. is arranging for an increase in the capacity of its plant from 300 to 1,000 bbl. of oil daily. The company recently acquired the Texas Interstate Producing & Refining Co. in connection with its expansion plans.

Washington

LA GRANDE—The American Nitrogen Products Co., operating a local plant, has made application to the Port Commission, Seattle, Wash., for a suitable site for the erection of a new plant for the manufacture of nitrogen products. It is proposed to acquire a tract of about four acres of land for the works, which are estimated to cost approximately \$500,000 with machinery. The company is now operating a branch plant at Lake Buntzen, near Vancouver, B. C.

West Virginia

FAIRMONT—The Monongah Glass Co. has awarded contracts for the installation of new equipment at its plant, to provide for increased production. Gas producers, conveying apparatus and kindred machinery will be installed. R. T. Cunningham is secretary and treasurer.

HORTON—The Parsons Pulp & Lumber Co., Finance Bldg., Philadelphia, Pa., is planning for the erection of a new mill in the vicinity of Horton for the manufacture of pulp products. The company will develop extensive properties both at Horton and Seneca, W. Va.

New Companies

THE PREMIUM OIL CORP., 1404 Harris Trust Bldg., Chicago, Ill., has been incorporated with a capital of \$50,000 to manufacture refined oil products. The incorporators are H. M. Cassidy, Stanley Rich and R. O. Farrell.

THE ADAMANTEX BRICK CO. OF NEW ENGLAND, INC., Boston, Mass., has been incorporated with a capital of \$400,000, to manufacture bricks and burned clay products. John R. Honors is president; and Frank S. Perkins, 393 Essex St., Salem, Mass., treasurer.

THE LIPTON SALT CO., New York City, has been incorporated with a capital of \$10,000 to manufacture salt and salt by-products. The incorporators are C. Lipton, J. Schlesinger and H. Dressner. The company is represented by L. Schfran, 51 Chambers St.

THE LA-HUNT OIL CO., Los Angeles, Cal., has been incorporated with a capital of \$500,000 to manufacture petroleum products. The incorporators are John G. Clark, S. J. Bowman and George Dennison. The company is represented by Cranahan & Clark, 501 Chapman Bldg.

THE BLACK DIAMOND IRON SYNDICATE, Salem, Ore., has been incorporated with a capital of \$100,000 to operate an ore reduction and smelting plant. The incorporators are E. S. Deardorff and O. P. Coshaw, Salem.

THE PETROLEUM PRODUCING & REFINING CO., 10 South La Salle St., Chicago, Ill., has been incorporated with a capital of 200 shares of stock, no par value, to manufacture refined oil products. The incorporators are John B. Weeden, H. J. Chatford and S. X. Willard.

THE LEATHER CHEMICAL PRODUCTS CORP., Newark, N. J., has been incorporated with a capital of \$100,000 to manufacture chemical products for leather service. The incorporators are Benjamin Shanefield, H. Kearns and Meyer Rashkes, 9 Clinton St.

THE FARNUM GLASS CO., Cambridge, Mass., has been incorporated with a capital of \$10,000 to manufacture glass specialties. G. F. Farnum is president; and Henry M. Rockwell, 496 Commonwealth Ave., is treasurer.

THE LONG BEACH-MIDWAY PETROLEUM CO., Long Beach, Cal., has been incorporated with a capital of \$400,000 to manufacture petroleum products. The incorporators are J. F. Steele, Carl Pohl, and John H. Burke, First National Bank Bldg., Long Beach.

GEORGE F. SNYDER, INC., Alpena, Mich., has been incorporated with a capital of \$50,000 to manufacture aluminum, brass, bronze and other metal castings. Samuel Taig and George F. Snyder, Alpena, are the incorporators.

THE THREE POINT PRODUCTS CORP., Albany, N. Y., has been incorporated with a capital of \$200,000 to manufacture chemicals, soaps and kindred products. The incorporators are E. F. Dolan, L. K. Luff and F. P. Gutelius. C. J. Tobin, Albany, represents the company.

THE LA PREME IVORY NOVELTY CO., East Passaic Ave. and Center St., Bloomfield, N. J., has filed notice of organization to manufacture celluloid and other composition products. Richard Webster heads the company.

THE GLOVER-KRASNOW CO., INC., Springfield, Mass., has been incorporated with a capital of \$10,000 to manufacture leather products. George Krasnow is president and George E. Glover, 211 Main St., treasurer.

THE METAL-CRAFT MFG. CO., Room 1018, 64 West Randolph St., Chicago, Ill., has been organized to manufacture metal products. The company is headed by Henry J. Ward and William B. Bosworth.

THE PARKER-KISKADEN CO., Detroit, Mich., has been incorporated with a capital of \$20,000 to manufacture greases, lubricants, etc. The incorporators are Charles A. Parker and Cameron H. Kiskadden, 46 Davenport St.

THE PETERSEN MFG. CO., INC., Scotch Plains, N. J., has been incorporated with a nominal capital of \$5,000, to manufacture asbestos products. The incorporators are George A. Oddie and George F. W. Petersen, Mountain Ave. and Stout St., Scotch Plains.

THE INTERNATIONAL EXTRACT CO., Lake Charles, La., has been incorporated with a capital of \$20,000, to manufacture prepared

extracts, chemicals, etc. Adolph Lagrange is president, and John J. Dubourg, secretary and treasurer, Lake Charles.

THE OCEAN OIL CO., Long Beach, Cal., has been incorporated with a capital of \$250,000 to manufacture petroleum products. The incorporators are V. S. Craig, C. M. Chandler and G. M. Spicer, 431 First National Bank Bldg., Long Beach.

THE JUS-TEL CHEMICAL CO., Brooklyn, N. Y., has been incorporated with a capital of \$50,000 to manufacture chemicals and chemical byproducts. The incorporators are A. and B. Juster, and E. Buchman. The company is represented by M. Eichner, 1545 B'way.

THE DETROIT ALLOY STEEL CO., Detroit, Mich., has been incorporated with a capital of \$50,000 to manufacture steel products. The incorporators are Frank L. Griffin, Robert H. Hall, and John Grant, 1938 Taylor Ave.

THE MACCO MFG. CO., Holyoke, Mass., has been incorporated with a capital of 5,000 shares of stock, no par value, to manufacture paper and paper products. William P. Corkindale is president; and Frank A. Gates, Holyoke, treasurer.

THE ILLINOIS GRAPHITE CO., 155 North Clark St., Chicago, Ill., has been incorporated with a capital of \$10,000 to manufacture graphite products. The incorporators are H. G. Sampson, W. J. Hough and E. M. Park.

B. TOUGIAS, INC., New York City, has been incorporated with a capital of \$25,000 to manufacture oil products. The incorporators are B. Tougas, L. Fish and S. Schiff. The company is represented by Kahn & Zorn, 66 B'way.

Capital Increases, Etc.

THE SENECA COPPER CORP., 11 B'way., New York City, has filed notice of increase in active capital from \$1,250,000 to \$1,700,000.

THE UNITED STATES REDUCTION CO., East Chicago, Ind., has filed notice of increase in capital from \$150,000 to \$350,000.

THE GENERAL CHINAWARE CORP., organized under Delaware laws with capital of \$850,000, has filed notice of organization to operate in New York for the manufacture of chinaware. R. D. Buchholtz, 15 Broad St., is representative.

THE CORONET PHOSPHATE CO., 99 John St., New York City, has filed notice of increase in capital from \$2,500,000 to \$3,000,000.

THE BROOKLYN PUTTY WORKS, 50 Bergen St., Brooklyn, N. Y., have filed notice of increase in capital to an active amount of \$10,000.

THE GENERAL PETROLEUM CO., 310 Sansome St., San Francisco, Cal., has arranged for a note issue of \$10,000,000, the proceeds to be used for expansion, general operations, financing, etc.

THE ST. LOUIS COKE & CHEMICAL CO., St. Louis, Mo., has arranged for a bond issue of \$10,000,000, the proceeds to be used for future expansion and current operations. Of the total amount, \$6,545,000 will be issued and sold immediately.

THE FISCHER & HAYES ROPE & STEEL CO., 741 West Van Buren St., Chicago, Ill., manufacturer of wire rope, etc., has filed notice of increase in capital from \$30,000 to \$150,000.

New Publications

BOOKS

AMERICAN BUSINESS METHODS. By Floyd W. Parsons, E.M. Pp. 373. New York: G. P. Putnam's Sons, 1921. Price, \$2.50.

"The purpose of this book is to supply the reader with practical knowledge of ways and means to increase production in any and all lines of business. In a material sense, production is the true measure of success of a corporation or an individual. Generally speaking, the fundamental principles of business are quite similar whether a man manufactures locomotives or sells lead pencils. The real secret of 'getting ahead' in any line of work appears to be ability to adapt the best practices of others to the business in hand.

"The data contained in this volume have been gathered from hundreds of leaders in dozens of industries. Much of the information has resulted from careful research and personal interviews, and has formed the foundation of articles published in the 'Everybody's Business' department of the *Saturday Evening Post*. In fact, the vol-

ume has been created largely as a result of the requests of many *Post* readers that the facts presented be elaborated and collected in book form.

"It is probably true that the book as a whole represents more research and more hours of labor than has ever before been devoted to any work of a kindred nature. There are many splendid books covering definite and distinct phases of business procedure, but investigation fails to disclose any volume that attempts the ambitious plan of treating all of the important problems that underlie modern commercial and industrial practice."

This mass of data has been arranged and classified so as to present continuity of thought under the headings or chapters: Industrial Relations; Health and Industry; Light and Ventilation; Labor-Saving Machinery; Advertising and Selling; Business Methods and Ideas; Foreign Trade Problems and Practices; Application of Science to Industry.

THE CHEMICAL ALLIANCE, INC., IN THE WORLD WAR. Pp. 82. Philadelphia: The Chemical Alliance, Inc., 1921.

This historical review of the Chemical Alliance, Inc., has been compiled pursuant to a request from the Historical Bureau of the General Staff, War Department, to all war service organizations to furnish reports of their activities. It has been prepared to form a permanent record of the object, organization and activities of the Chemical Alliance and its service to the Government during the war period and in the solution of after-war problems.

The first part of the review comprises a report by the president, Horace Bowker, which was presented at the second annual meeting, held at New York City, Jan. 22 and 23, 1919. Incorporated in Mr. Bowker's report are brief records of the activities of the various committees which had been functioning during the war and post-war periods.

The latter part of the book records the cessation of the activities of the Alliance, together with the appreciation of its services by Government officials. The closing record is the decision to continue the Alliance indefinitely as an inactive organization.

FACTORY CHEMISTRY. By William H. Hawkes, M.Sc., department of chemistry, Ford Institute of Technology, Detroit, Mich. Pp. 59. New York: Longmans, Green & Co., 1921. Price \$1.

This is a very elementary treatment especially designed for factory men interested in the study of chemistry as it bears on the various operations in factory processes. A short outline of qualitative analysis is included, so that the book is preparatory to courses in quantitative metallurgical analysis and metallography.

THE BUSINESS LIBRARY—WHAT IT IS AND WHAT IT DOES. By Louise B. Krause. Pp. 124, illustrated. San Francisco: *Journal of Electricity and Western Industry*.

Coming Meetings and Events

AMERICAN CERAMIC SOCIETY'S summer meeting will be held at Canton, Alliance, Sebring and East Liverpool, Ohio, July 25 to 27. Headquarters will be at the Hotel Courtland, Canton, Ohio.

AMERICAN CHEMICAL SOCIETY, THE SOCIETY OF CHEMICAL INDUSTRY and the American Section of the latter society will hold a joint meeting in New York, Sept. 6 to 10.

AMERICAN ELECTROCHEMICAL SOCIETY will hold its fall meeting in Lake Placid, N. Y., Sept. 29 and 30, and Oct. 1.

AMERICAN MINING CONGRESS AND NATIONAL EXPOSITION OF MINES AND MINING EQUIPMENT will hold its twenty-fourth annual convention in the Coliseum, Chicago, Oct. 17 to 22.

AMERICAN SOCIETY FOR STEEL TREATING will hold its third annual convention and exhibition Sept. 19 to 24 at Indianapolis.

THE NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES (SEVENTH) will be held during the week of Sept. 12 in the Eighth Coast Artillery Armory, New York City.

NEW JERSEY CHEMICAL SOCIETY holds a meeting at Stettens Restaurant, 842 Broad St., Newark, N. J., the second Monday of every month.

SOCIETY OF CHEMICAL INDUSTRY (BRITISH) at the invitation of the Montreal section will hold its annual meeting in Montreal and other Canadian cities during the week of Aug. 29, 1921. Details will be printed in this magazine from time to time.
